Because of the risk that the enemy may achieve such a change of front, it is usual, and usually necessary, for the dislocating move to be preceded by a move or moves, which can perhaps best be classified under the term "distract" in its literal sense of "to draw asunder." The purpose of this "distraction" is to deprive the enemy of his freedom of action, and it should operate in both the physical and psychological spheres. In the physical, by causing a distension of his forces or their diversion to unprofitable ends, so that they are too widely distributed and too committed elsewhere to have the power of interfering with one's own decisively intended move. In the psychological sphere, the same effect is sought by playing upon the fears of, and by deceiving the opposing command. "Stonewall" Jackson realized this when he framed his strategical motto—"Mystify, mislead, and surprise." For to mystify and to mislead constitutes "distraction," and surprise is the essential cause of "dislocation." And it is through the "distraction" of the commander's mind that the distraction of his forces follows. The loss of his freedom of action is the sequel to the loss of his freedom of conception.

Realizing how the psychological permeates and dominates the physical sphere, we begin to see what Napoleon meant by his famous dictum that "the moral is to the physical as three to one." This realization warns us, too, of the fallacy and shallowness of attempting to analyze and theorize about strategy in terms of mathematics. To treat it quantitatively, as if the issue turned merely on a superior concentration of force at a selected place is as faulty as to treat it geometrically as a question of lines and angles. Yet voluminous works have been devoted to a "compartmented" analysis of strategy under such headings as "the relation between the fronts of opposing armies and their respective lines of communication with their base," "Case of both armies forming on a front parallel to the line of communication with the base," and so on.

But a prolonged abstract analysis of psychological strategy would be wearisome without being helpful, for it is only possible to probe into the mind of a commander through the medium of historical examples. Lack of space here forbids even an outline of strategical history, and all that can be done is to give some indication of the examples most worthy of study and of the main developments in methods and conditions. But while the means of strategy change and develop, so that there is progress in the physical sphere, in the psychological sphere it is no more possible to talk of the evolution of strategy than it is to talk of the evolution of painting. The history of strategy is an arid waste—of reliance upon sheer force—illumined by the genius of occasional masters for playing upon the mind of their opponents.

In ancient warfare the absence of "lines of communication" limited the scope for strategy. Hence the use of the indirect approach is mainly seen in grand strategy or in the immediate prelude to a battle. In one case, however, the scale and range of the effort compelled the adoption of what was virtually a "line of communication" for its maintenance. This was in the first "Great War" of European history—the Great Persian War. The indirect approach which dislocated the Persian invasion of 481 B.C. was made by sea, and it is noteworthy that the power of strategic mobility at sea was realized much earlier than on land.

In land warfare true strategy, and the indirect approach, are first manifested when Thebes challenged Sparta for the supremacy which she had wrested from Athens. Epaminondas might well be called the "father of strategy" was it not that the term suggests the idea of subsequent evolution. Certainly in strategy as in tactics he was the first master, and the operations which preceded the battle of Mantineia (*q.v.*) reveal the ripening of his art. Until his final campaigns on the Indian border, his strategy is direct and devoid of subtlety. The cause would appear to be, first, that in the youthful Alexander, bred to kingship and triumph, there was more of the Homeric hero than in the other great captains of history; and, still more perhaps, that he had such justifiable confidence in the superiority of his instrument and his own battle-handling of it that he felt no need to dislocate preparatorily his adversaries' strategic balance. His lessons for posterity lie at the two poles—war-policy and tactics.

With Hannibal and Scipio tactical art reached the highest level of ancient times, perhaps of all times, and if strategy was still handicapped by its means, certain phases of the war are most illuminating. We have already dwelt upon the Trasimene episode. Thereafter both sides adopted a war policy of indirect approach to a political rather than a military end. Roman strategy, under the direction of Fabius, was too convinced of Hannibal's military superiority to risk a military decision, and while seeking to avoid this, aimed by military pin-pricks to wear down the endurance of the invader and coincidently prevent his

strength being recruited from the Italian cities or from his Carthaginian base. Hannibal, either from doubt as to the wisdom of testing the resisting power of the walls of Rome itself or from subtler reasons, spent the succeeding years in trying to loosen Rome's hold on her Italian allies and to weld them into a coalition against her. Victories were merely a moral impetus towards this goal. The superiority of his cavalry gave his tactical instrument an assured advantage if he could lure the enemy to battle on the plains He succeeded once at Cannae (*q v*), but otherwise Rome's inflexible resolution in pursuing her own strategy of evasion at any sacrifice combined with the conditions of the age, with his own comparative weakness, and with his situation as the invader—of a primitively organized land—to thwart his aim. When Scipio later replied by a counter-invasion of Africa he found the more highly developed economic and social structure of Carthage an aid to his plans.

But before this, the Italian theatre had witnessed an example of strategy which is an historical landmark. Nero's Metaurus (*q.v.*) operation is the first clear case of what in strategical jargon is commonly called "interior lines," a term which certainly does not explain itself. It may perhaps be more clearly defined as using a central position between two enemy forces to fall upon one of them with the bulk of one's force. At its best this strategy is an indirect approach whereby one enemy force is bluffed into passivity while the other, isolated, is crushed. If Nero's was the first example, it has hardly been surpassed

Scipio's operations began in Spain, Hannibal's strategic base and source of reinforcements, and by first depriving the Carthaginian armies there of their local base, Cartagena (*q.v*), he led up to the complete overthrow of the Carthaginian power in Spain. Then, instead of attacking Hannibal in Italy, as his seniors wished and so many of his predecessors had tried in vain, Scipio sailed for Africa. There, while still in small force, he repeatedly trapped and broke up the forces of Carthage without hazarding any direct advance on the fortified city but exploiting his military successes to lop off its supply areas and allies.

To reinforce these forms of moral suasion he advanced to Tunis, in sight of Carthage, as "a most effective means of striking the Carthaginians with terror and dismay." Coming on top of the other indirect forms of pressure it was sufficient to dislocate the Carthaginians' will to resist, and they sued for peace But while awaiting ratification in Rome, the provisional peace was broken when Carthage had news of Hannibal's return, and of his landing at Leptis In such circumstances, an orthodox general would either have taken the offensive, in order to prevent Hannibal reaching Carthage, or have stood on the defensive to await relief. Instead, Scipio moved swiftly against Carthage's main source of supplies from the interior, and thus lured Hannibal to an area of his own choosing, where Hannibal lacked the material reinforcement, stable pivot, and shelter in case of defeat which he would have had if the battle had taken place near Carthage. Still Scipio was not content, but drew Hannibal to a camping ground where the Carthaginians suffered from lack of water and to a battle-ground in the plain where Scipio's newly gained advantage in cavalry could have full play He had taken the first two tricks; on the battlefield of Zama (*q v*) he was enabled to take the rubber by tactically overtrumping Hannibal's former "cavalry" trump. The bloodless surrender of Carthage followed

Mediaeval Warfare.—With the submersion of the Roman empire in the West, the art of war was also submerged, but in the Eastern Roman Empire (*see* article BYZANTIUM) it continued to flourish. Actual examples are too obscure for analysis, but the Byzantine textbooks exude the pure spirit of strategy and of the indirect approach. No generals knew better than the Byzantine the importance of adjusting the end to the means.

In the West during the Middle Ages the military spirit of feudal "chivalry" was inimical to art, although the drab stupidity of its military course is lightened by a few bright gleams. King John of England had a real insight into grand strategy, and Prince Edward, later Edward I., produced a masterly example of mobility in exploiting a central position in the Evesham (*q v.*) campaign. The 13th century was also marked by the paralyzing lesson taught by the Mongols to European chivalry. Slight as our knowledge of events it is sufficient to trace the outline of strategic conceptions as grand in scale as they were subtle in calculation. (*See* further MONGOL CAMPAIGNS.)

Dawn of Modern History.—On entering the domain of modern history, we find that the Renaissance extended its influence to military affairs and that the regained inspiration of classical examples gave an invigorating impulse to the conduct of war.

But in the strict sense of the term, Cromwell stands out as the first great strategist of modern history. Perhaps none in all history can show a consecutive series of three masterpieces comparable to the Preston, Dunbar and Worcester campaigns, for breadth of manoeuvre and skill in "unhinging" the enemy's balance. Their swift decisiveness was all the more notable because the First Civil War had been so drawn out, so indecisive in its course despite the prevalence of a decision-desiring spirit rare in 17th century warfare (*See* GREAT REBELLION.)

Conditions of 17th and 18th Centuries.—On the continent, during the 17th and most of the 18th century, warfare was as indecisive as it was continual. The common explanation is that these wars sprang from dynastic causes, that they were undertaken to gain small extensions of territory or power, and that as the professional armies of the time were expensive instruments, rulers were chary of damaging them and of risking too much for the sake of such limited aims The development of standing armies and the high standard of training required by the development of individual firearms and the complex drill evolutions undoubtedly placed a check on the lavish use and expenditure of professional soldiers But this check can be, and has been, exaggerated Professional soldiers formed only the backbone of the armies of the time, which were usually made up by militia men recruited by lot. Again, common-sense, reacting from the injurious practice of pillage and devastation which had injured all parties in the Thirty Years' War (*q v*), reinforced a growing humanitarianism in protest against such gross interference with and exactions from the civil population This feeling contributed to the development of the practice of feeding and maintaining armies from supply trains based on an organized chain of magazines But a still greater impulse was given by example—the impressive success attained by the armies of Louis XIV which, under Louvois' administration, embodied the essential elements of modern military organization Its system of supply from magazines was not inspired by mere humanitarianism but by the desire for efficiency—to avoid the constant checks on mobility and on the scope of operations which were inevitable so long as armies lived like locusts, forced to evacuate areas of country because of the pressure of their own hunger after exhausting its resources If this system of magazines enhanced the importance of fortresses as a site for them, it also gave a new importance to and opportunity for threats to the lines of communication The one cancelled out the other. We must seek elsewhere for the main explanation of the indecisiveness of this period of warfare

Nor shall we find it in the limited political aims or "geographical objectives." While these often prevailed, they did not dominate the horizon of such rulers and statesmen as Richelieu, Louis XIV and Frederick. Their correspondence, urging energetic and decisive action, dispels such illusions

The real explanation, more obvious and more natural, is that the military conditions of the time hindered decisive results. On the one hand was the development of fortification, field and permanent, in reply to the earlier growth of artillery. Protection caught up and outpaced the effect of weapons. It gave to the defensive a preponderance such as the development of the machine-gun revived in the 20th century. On the other hand the indivisibility of armies limited the capacity of strategy to upset this defensive balance of power. For they still moved and fought normally as a solid block, a single "piece" on the chessboard of war, a condition which limited their ability to deceive the opponent and to cramp his freedom of movement. Previous to the inauguration of the "divisional" organization, about 1760, by de Broglie, only Cromwell's campaigns show a full appreciation of the

strategic value of what one may call "the distribution of force for a concentrated purpose."

Yet in the annals of 17th century warfare there is one example, Turenne's winter campaign of 1674–75 (*see* DUTCH WARS), which shows how art might be employed to decisive result even under the handicapping conditions of the period. At a time when all manoeuvres were based on fortress pivots he cut loose from this base of operations and sought, in surprise and mobility, not only a decision but his security. It was a just calculation, not a gamble, for the dislocation, psychological and physical, created among the enemy afforded him throughout an ample margin of security.

The War of the Spanish Succession (*q.v.*) which lasted for 12 years, 1701–1713, was made up largely of an abortive succession of direct approaches or scarcely more purposeful indirect moves. It was illumined, however, by the genius of Marlborough, and the war's purposeful indirect approaches are chiefly but not entirely associated with his name. Their significant interest lies in the way they mark the several turning points of the war.

Unlike Marlborough, Frederick was free from the responsibility and limitations which are imposed on a strategist, in the strict sense of the word. For he combined in his person the functions of grand strategy and strategy. Other advantages which he enjoyed over Marlborough were the comparative scarcity of fortresses in his theatres of war and the greater scope for moving troops off the roads. Yet despite a long string of victories in battle the Seven Years' War (*q.v.*) was not only indecisive in its course, but saw Frederick almost stripped of resources and incapable of further resistance by 1762 when external factors came to his rescue. The cause deserves enquiry.

Although faced by the coalition of Austria, France, Russia, Sweden and Saxony, with England as his only ally, Frederick had at the outset and until midway through the second campaign, a superiority in the actual forces available. In addition he had the asset of a central position. This enabled him to practise what is commonly called the strategy of "interior lines," striking outwards from his central pivot against one of the forces on the circumference, and utilizing the shorter distance he had thus to travel to concentrate against one of the enemy forces before it could be supported by the others. Ostensibly, it would seem that the further apart these enemy forces, the easier it must be to achieve a decisive success. In terms of time, space and number, this is undoubtedly true. But once more the moral element intrudes. When the enemy forces are widely separated each is self-contained and tends to be consolidated by pressure. When they are close together they tend to coalesce and "become members one of another," mutually dependent in mind, moral and matter. The minds of the commanders affect each other, moral impressions are quickly transfused, and even the movements of each force easily hinder or disorganize those of the others. Thus if the antagonist has less time and space for his action, the dislocating results of it take effect more quickly and easily. Further, when forces are close together the enemy's mere divergence from his approach to one of them may become an unexpected, and therefore truly indirect approach to another. In contrast, when forces are widely separated there is more time to prepare to meet, or avoid, the second blow of the army which is exploiting its central position.

Frederick consistently used his central position to concentrate against one fraction of the enemy. And he always employed tactics of indirect approach. Thereby he gained many victories. But his tactical indirect approach was normally only in the sphere of logistics and for all their executive skill, these manoeuvres were narrow. The opponent might be unable to meet the following blow, owing to the rigidity of his mind or his functions, but the blow itself did not fall unexpected by him.

As Frederick's roll of victories lengthened, his prospects and his resources diminished, until by 1759 he could do no more than passively block the enemy.

If many lessons are to be culled from Frederick's campaigns, the main one would appear to be, in a sentence, that "His indirectness was too direct." Or, to express it in another way, that he regarded the indirect approach as a matter of pure mobility, instead of a combination of mobility and surprise. Thus, despite all his brilliance, his economy of force broke down.

Thirty years later the outbreak of the French Revolutionary Wars gave Napoleon Bonaparte the opportunity to make the greatest of all developments in the physical sphere of strategy. In this development he exploited and combined the assets latent in three fresh conditions. The first condition arose from the composition and spirit of the Revolutionary armies. (*See* FRENCH REVOLUTIONARY WARS and CONSCRIPTION.) Their impetuous and undisciplined enthusiasm, instability of temper, and large infusion of new blood, made the old precise drill impossible. This difficulty, in compensation, gave birth to a simple yet vital change whereby the French marched and fought at a quick step of 120 paces to the minute, while their opponents adhered to the orthodox 70 paces. This elementary difference, in days before mechanical science endowed armies with means of movement swifter than the human leg, made possible the rapid transference and redistribution of force whereby the French could, in Napoleon's phrase, multiply "mass by velocity" both strategically and tactically.

The second condition was the organization of the army into permanent "divisions." Initiated by de Broglie, the emergency of the Revolution crystallized the reform. Then Carnot initiated and Bonaparte developed the idea that these divisions while operating separately should co-operate to a common goal. This new condition enabled a far wider range of strategic combinations than had been possible before.

The third condition, linked with this, was that the chaotic supply system and the undisciplined nature of the Revolutionary armies compelled a reversion to the old practice of "living on the country." And the distribution of the army in divisions meant that this practice detracted less from the army's effectiveness than in old days. Where, formerly, the fractions had to be collected before they could carry out an operation, now they could be serving a military purpose while feeding themselves. Moreover, the effect of "moving light" was to accelerate their mobility, and to enable them to move freely in mountainous or forest country. Similarly, the very fact that they were unable to depend on magazines and supply trains for food and equipment lent impetus to hungry and ill-clad troops in descending upon the rear of an enemy who had, and depended on, such direct forms of supply.

Napoleon Bonaparte.—Bonaparte's development of these conditions into a new strategic method is to be traced in his Italian campaigns of 1796–97. The physical, or logistical, indirect approach formed its foundation and the dislocating surprise which it produced was the product of his astonishing mobility rather than of any research for pure surprise. His first great development of strategical methods was the disposition of his forces in a loose and wide-flung grouping which could be swung in any direction. Like a net weighted with heavy stones, when one of the enemy's columns came in contact with it, the pressure caused the net to tighten round it, and the stones crashed together on it. The self-protective formation of the divisions thus became, on impact, a concentrated offensive formation. It evolved into the more highly developed *bataillon carré*, with army corps replacing divisions, of his later wars. His second was the idea of a strategic "barrage" created by gaining and using a "natural position," such as a river or mountain range across the enemy's rear. Such a position, offering natural obstacles, afforded him a secure pivot from which to prepare a firm embrace for the enemy, whose "natural" tendency, when cut off from their line of retreat and supply, was to turn and flow back, usually in driblets, towards him. Its use is particularly well illustrated in his 1800 and 1805 campaigns. (*See* FRENCH REVOLUTIONARY WARS and NAPOLEONIC CAMPAIGNS.)

Strategical Degeneration.—But, from the time he became Emperor and had seemingly inexhaustible resources at his disposal, this assured superiority of force had a growing influence on his strategy. From 1806 onwards Napoleon seems concerned mainly with the single end of bringing his enemy to battle, confident that, when this happened, his machine would overpower the

enemy. He still uses the manoeuvre onto their rear, but it is more as a means of gripping them firmly so that they can be drawn into his jaws, than as a means of liquefying their morale so that mastication may be easier. Moreover when hitches occur in the execution of these manoeuvres, his impatience leads him to gamble on a direct approach and battle. At Aspern–Essling (*q.v.*) he suffers in consequence his first great defeat.

The Russian campaign of 1812 is the natural climax to the tendencies already seen to be growing in Napoleon's strategy—that of relying more on mass than on mobility, and on strategic formation rather than on surprise. The geographical conditions merely serve to accentuate its weaknesses.

The disastrous results of the subsequent retreat from Moscow were due less to the severe weather—the frost was actually late—than to the demoralization of the French army, which was the reaction from the frustration of its direct battle-aimed strategy.

Only in 1814 when he had dissipated his resources and his credit, did he resharpen his old tools and strive to re-establish an adjustment between end and means. Realizing that his means were too impoverished for military success, he aimed to dislocate the co-operation between the allied armies, and exploited mobility to this end. Even so, astonishing as his success in retarding the enemy's end, it might perhaps have been more effective and enduring, if his ability to continue this strategy had not been diminished by his inherent tendency to consummate every strategic success by a tactical one.

The American Civil War.—The next breeding ground of generals worthy of the title of strategists was the American Civil War (*q v*). But, despite a refreshing breadth of view and fertility of resource in what may be termed local strategy, the conventional aim at first directed the major operations.

The repulse of Lee's invasion at Gettysburg has commonly been acclaimed the turning point of the war, but the claim is only justified in a dramatic sense, and the sober verdict of historical opinion has more and more emphasized that the decisive effects came from the West. The first was achieved, on the central Mississippi on the same day, July 4, as Lee began his retreat from Gettysburg. This was the capture of Vicksburg (*q v.*) by Grant, which gave the Federals complete control of this vital artery. Thereby the Confederacy was deprived permanently of the nourishment of reinforcements and supplies from the Trans-Mississippi states. Grant took the calculated risk of cutting himself loose from his base and moving to place himself on the rear of Vicksburg and astride its communications with the main Eastern states of the Confederacy. It is worth while to note that while Napoleon had used the line of a river or range of hills as his strategic barrage, Grant's strategic barrage was constituted by the possession of a single point—a railway junction This secured, he then turned about and moved on Vicksburg, which was now isolated long enough to ensure its capitulation seven weeks later. The strategic sequel was the opening of the Chattanooga gateway into Georgia, the granary of the Confederacy, and thence into the Eastern states as a whole.

Defeat was now hardly avoidable by the Confederacy. Yet the Federals almost forfeited the victory already ensured. For in 1864 with the North growing weary under the strain, the moral element became preponderant The peace party was gathering weight, and unless Lincoln was to be supplanted by a president pledged to seek a compromise peace, a solid guarantee of early victory must be forthcoming To this end Grant was summoned from the West to take over the supreme command.

But he decided on the old direct overland approach southward from the Rappahannock towards Richmond. In justice, it should be noted that if his approach was direct in the broad sense, it was in no sense a mere frontal push. Indeed, he continuously sought to turn his enemy's flanks by manoeuvre, if of a narrow radius.

Yet by the end of the summer of 1864 the ripe fruit of victory had withered in the hands of the North. The Federals had almost reached the end of their endurance, and Lincoln despaired of re-election—a sorry repayment for the blank cheque he had given his military executant It is an ironical reflection that the determination with which Grant had wielded his superior weight, now fearfully shrunk after the fierce battles of the Wilderness and Cold Harbour, had utterly failed to crush the enemy's army, while the chief result—the geographical advantage of having worked round close to the rear of Richmond—was gained by the bloodless manoeuvres which had punctuated his advance. He had thus the modified satisfaction of being back, after immense loss, in the position which McClellan had occupied in 1862. But when the sky looked blackest it suddenly lightened. At the November elections Lincoln was returned to power. The relief came not from Grant's campaign, which made little progress after July, and flickered out with a costly double failure in mid-October. Sherman's capture of Atlanta in September was the instrument of salvation Atlanta, the base of the enemy army guarding the back-door of the Confederacy, was not only an important junction and source of supplies but a moral symbol. And in gaining it Sherman's economy of force by manoeuvre is the more notable because, compared to Grant in Virginia, he was practically tied to one line of railway for his supplies. Yet, rather than commit his troops to a direct attack he cut loose temporarily even from this, and he manoeuvred so skilfully as to lure the Confederates time after time into vain attacks. Thus to force an opponent acting on the strategic defensive into a succession of costly tactical offensives was a triumph of strategic artistry Atlanta gained, Sherman took a risk greater than ever before, and one for which he has been much criticized by military commentators. He was convinced that if he could ruin the railway system of Georgia and the Carolinas and so prevent supplies going north to Richmond and Lee's army, the resistance of the Confederates would collapse Hence, ignoring Hood's army, which he had forced to evacuate Atlanta, he began his famous "march to the sea" through Georgia, living on the country while he destroyed the railways. On November 15, 1864 he left Atlanta; on December 10 he reached the outskirts of Savannah and there reopened his communications, this time by sea, as well as depriving the South of its chief remaining ports Then he moved northwards through the Carolinas towards Lee's rear. Not until over three months later, the beginning of April, did Grant resume his advance This obtained a dramatic success, and the surrender of Richmond was followed within a week by the surrender of Lee's army. Superficially it was a triumphant vindication for Grant's direct pressure But for a serious judgment the time factor is all important The collapse of the Confederate resistance was due to the emptiness of its stomach reacting on its moral.

The American Civil War had revealed the influence not only of the development of railways upon strategy, but of changing economic conditions, but its embryonic lesson was largely obscured by the war of 1870 in Europe. Here inferiority of force and stupidity of mind so weighted the scales against the French that a quick military decision was obtained. The World War (*q.v.*) and its strategical lessons are discussed in detail elsewhere

Conclusion.—Throughout history the direct approach, aiming to gain a decision by the tactical application of a superior concentration of force, has been the normal form of strategy; a purposeful indirect approach, the rare exception. Yet the latter form of strategy has many decisive successes to its credit; the former, few. And those few have been purchased at exorbitant cost. In numerous cases, moreover, the indirect approach has only been adopted as a last resource, even a last gamble, after the failure of a direct approach. A decisive success in such deteriorated conditions invests the lesson with special significance.

Reflection suggests, and history confirms, that a direct approach is the worst of all military "risks"—worse than the passage of mountains, deserts or swamps, worse than that of cutting oneself loose from one's supplies or of operating with inferior force. Natural hazards, however formidable, are inherently less dangerous and uncertain than fighting hazards. For all conditions are more calculable, all obstacles more surmountable than those of human resistance. By reasoned calculation and preparation they can be overcome almost "to time-table."

It was Clausewitz who, reacting against the "geometrical" interpretation of Napoleon's strategy, laid down that "the independent will-power of his opponent" is the least calculable and

most formidable of the factors with which a commander has to deal. But his line of thought and teaching led him to place excessive emphasis on force applied through the bodies of a commander's troops as the means of damaging the commander's will. It is curious that he should have neglected the heightened power and speed of impressions made immediately on the opposing commander's mind, in favour of impressions made through a "third party" channel. But the teaching of Clausewitz was directed more to fortify the will of the commander on his own side than to undermine the will of the opposing commander. And he was a cultivator of expectancy, rather than an exponent of the unexpected.

Hence force overshadowed surprise and mobility on the strategical horizon of the 19th and early 20th centuries. Hence the relative neglect not only of psychological surprise but of new inventions which might contribute to it. So also with mobility—rate of movement was treated as an invariable factor. In staff rides and exercises, calculations and plans were based on "normal" times, and little research was made into the advantages of unexpected acceleration by new means or by a partial sacrifice of strength and convenience. In contrast to Napoleonic practice, undue stress was laid on the importance of bringing a force entire to its destination—tying it to the pace of its slowest elements. Equally neglected was the lesson contained in Napoleon's *marche de manoeuvre*—guns and trains upon the road, infantry and cavalry moving across country. Even since the World War, although the strategic value of tanks and the newer forms of transport lies as much or more in their power of cross-country movement as in their speed, the strategic advantages of such movement are rarely applied or realized. This failure of comprehension is perhaps the less surprising when, in studying the history of the past hundred years, we see the failure of strategists to grasp the idea underlying Napoleon's use of the divisional system. By 1870 the intervals had become much narrower and by 1914 armies were back in the old solid block, with the divisions rubbing shoulders in a long, inflexible, unmanoeuvrable, line. Yet all the time the increasing range of weapons had progressively diminished the risk and increased the profit of leaving intervals—of a calculated distribution of force for a concentrated purpose. For the divisional organization was by its nature a fresh aid to the strategy of indirect approach, whose psychological purpose may be epitomized in the one word "trap"—the trap being most often baited by a military move directed against an economic target—the sources of supply of the opposing state or army. The future is likely to strengthen this experience, for national conditions and the development of civilization are bringing new influences to bear on strategy and opening to strategy new channels of influence. These were foreshadowed in the American Civil War.

To overthrow the enemy's armed forces may still be the quickest and most effectual way to cause the collapse of the enemy nation's will to resist. But the new civil conditions provide a far stronger argument against attempting it unless the military conditions are highly favourable to its success. The civil conditions give the strategist not only an alternative channel of action but an additional lever towards his military aims. By threatening economic objectives he may be able both to distract and dislocate the enemy's military dispositions, while the greater frequency and sensitiveness of such civil objectives may give him opportunities to slip past the military shield and strike at them with decisive results. This potential development of strategy is greatly favoured by the advent of the air weapon, which introduces a third dimension of movement. Metaphorically, the effect may be defined as the replacement of a "draughts-board" theatre of war by a "halma-board"—for aircraft have the power of "hopping over" resistance. (B. H. L. H.)

Bibliography.—Among a host of books the following may be selected as illustrating the thought of different periods and schools: The *Chinese Book of War;* Machiavelli, *Dell' arte Della Guerra;* Jomini, *Précis de l'art de la Guerre;* Clausewitz, *vom Kriege;* Willisen, *Theorie des Grossen Krieges;* Moltke, *Taktisch-strategische Aufsätze;* Colin, *Les Transformations de la Guerre;* Bloch, *La Guerre;* Fuller, *The Foundations of a Science of War;* Liddell Hart, *The Decisive Wars of History.* Any general survey should be supplemented by the study of good military biographies, but they are rare.

STRATEGY, NAVAL: *see* Naval Strategy and Tactics.

STRATFORD, JOHN DE (d. 1348), archbishop of Canterbury, was born at Stratford-on-Avon and educated at Merton College, Oxford, afterwards entering the service of Edward II. He served as archdeacon of Lincoln, canon of York and dean of the court of arches before 1323, when he became bishop of Winchester, an appointment which was made during his visit to Pope John XXII. at Avignon and which was very much disliked by Edward II. In 1327 the bishop joined Queen Isabella's partisans; he drew up the six articles against Edward II., and was one of those who visited the captive king at Kenilworth to urge him to abdicate in favour of his son. Under Edward III. he became a member of the royal council, but his political importance dates from the fall of Roger Mortimer. In November 1330 Stratford became chancellor, and for the next ten years he was the king's most prominent adviser and the "head of the Lancastrian or constitutional party" (Stubbs). In 1333 he was appointed archbishop of Canterbury, and he resigned the chancellorship in 1334. He was again chancellor from 1335 to 1337 and for about two months in 1340. In November 1340 Edward III., humiliated, impecunious and angry, returned suddenly to England from Flanders and vented his wrath upon the archbishop's brother, the chancellor, Robert de Stratford. Fearing arrest John de Stratford fled to Canterbury, but after a violent dispute the principle was established that peers were only to be tried in full parliament before their own order (*en pleyn parlement et devant les piers*). The archbishop acted as president of the council during Edward's absence from England in 1345 and 1346, although he never regained his former position of influence. He died at Mayfield in Sussex on Aug. 23, 1348.

STRATFORD, a city and port of entry of Ontario, Canada, and capital of Perth county, situated 83 m. W.S.W. of Toronto by the Canadian National railway, on the Avon river. Pop. (1921) 16,094. The repair and engineering shops of the railway, flour-, saw- and woollen-mills, engine and agricultural implement works are the principal industries. A large export trade in cheese and other dairy and farm produce is carried on.

STRATFORD DE REDCLIFFE, STRATFORD CANNING, Viscount (1786–1880), British diplomatist, was born in Clement's Lane in the city of London, on Nov. 4, 1786. His father, Stratford Canning, uncle of George Canning (*q.v.*), who had been disinherited for his marriage with Mehetabel Patrick, died when the boy was six months old. He was educated at Eton, and had kept two terms at King's College, Cambridge, when, in 1807, his cousin, George Canning, gave him an appointment in the foreign office. In 1808 he was appointed first secretary to Robert Adair, ambassador to Constantinople. When Adair was transferred to Vienna in 1810, Canning remained at Constantinople as *chargé d'affaires.* Canning was left entirely to his own discretion. In May 1812 he helped to arrange the peace of Bucharest between Turkey and Russia, which left a powerful Russian army free to repel Napoleon's invasion. Canning was able to hasten the decision of the Turks, by making judicious use of Napoleon's plan for the partition of their empire. A copy of it had been left in his hands by Mr. Adair to be used at the proper moment. In July he left Constantinople with the desire to enter political life at home. But Castlereagh arranged for him to receive a retaining fee binding him to the service. He spent four years as minister at Berne (1814–18). In 1819 he was appointed minister at Washington, a station of great difficulty owing to the many questions outstanding between the British and the American governments. Canning, who had a quick temper, came into occasional collision with John Quincy Adams, the American secretary of State. Yet they parted with mutual respect. Canning returned to England in 1823. The general treaty he had arranged with Mr. Adams was rejected by the United States Senate.

In 1824 Canning was selected as ambassador to Turkey, and proceeded to Constantinople after a preliminary visit to Vienna and to St. Petersburg, where he discussed the Alaska boundary question and sounded the Russian Government as to the course to be taken with the Greek revolt against Turkey. He left for Constantinople in October 1825. At Constantinople he was

engaged with the French and Russian ambassadors in the hopeless task of inducing Sultan Mahmud II. to make concessions to the Greeks, without the pressure of armed force. After the battle of Navarino (*q.v.*) on Oct. 20, 1827, the ambassadors retired to Corfu. Canning then went home, but was sent back on July 8, 1828. Canning did not agree on all points with Lord Aberdeen, and in 1829 he, for the time being, turned from diplomatic to parliamentary life. He sat for Old Sarum, for Stockbridge (rotten boroughs) and for Southampton, but did not make much mark in parliament He was twice absent on diplomatic missions. At the end of 1831 he went to Constantinople to attend the conferences on the delimitation of the Greek frontier, arriving immediately after the receipt of the news of Mohammed Ali's invasion of Syria. (*See* MOHAMMED ALI.) Sultan Mahmud now proposed to Canning an alliance between Great Britain and Turkey, and Canning strongly urged this upon Palmerston, pointing out the advisability of helping the sultan against Mohammed Ali in order to forestall Russia, and of at the same time placating Mohammed Ali by guaranteeing him certain advantages. This advice, which largely anticipated the settlement of 1841, was not followed; but Canning himself was in high favour with the sultan In 1833 he was selected as ambassador to Russia, but the Tsar Nicholas I, who knew his peremptory methods, refused to receive him.

Canning was again sent to Constantinople in Jan 1842 and remained there as ambassador until 1858. His tenure of office in these years was made remarkable—first by his constant efforts to induce the Turkish Government to accept reform and to conduct itself with humanity and decency; then by the Crimean War (*q.v.*). Canning had no original liking for the Turks. He was the first to express an ardent hope that they would be expelled from Europe with "bag and baggage"—a phrase made popular in after times by Gladstone But he had persuaded himself that under the new sultan Abd-ul-Mejid they might be reformed On the fall of Palmerston's ministry in Feb. 1858 he resigned. He had been raised to the peerage in 1852. During his later years he wrote several essays collected under the title of *The Eastern Question* (1881). In 1873 he published his treatise, *Why I am a Christian,* and in 1876 his play, *Alfred the Great at Athelney.* The only son of his second marriage died before him. His wife and two daughters survived him. Lord Stratford died on Aug. 14, 1880, and was buried at Frant in Sussex. A monument to him was erected in Westminster Abbey in 1884.

See S. Lane Poole, *Life of Lord Stratford de Redcliffe* (1888).

STRATFORD-ON-AVON, a market town mainly on the west bank of the Avon, in the Stratford-on-Avon parliamentary division of Warwickshire, England; on a branch line of the Great Western Railway (London 92½ m.: Birmingham 33½). Pop. (1921), 9,392 The neighbourhood is beautiful though of no considerable elevation The river flows in exquisite wooded reaches, navigable only for small boats The Stratford canal communicates with the Warwick and Birmingham canal. The river is crossed at Stratford by a stone bridge of 14 arches, built by Sir Hugh Clopton in the reign of Henry VII. The church of the Holy Trinity occupies the site of a monastery, which existed before 691, when the bishop of Worcester received it from Ethelred of Mercia. It is a fine cruciform structure, partly Early English and partly Perpendicular It was greatly improved in the reign of Edward III. by John de Stratford, who rebuilt the south aisle He also in 1332 founded a chantry for priests, and in 1351 Ralph de Stratford built for John's chantry priests "a house of square stone," in connexion with which the church became collegiate The present choir was built by Dean Balshall (1465–91), and in the reign of Henry VII. the north and south transepts were erected. A window commemorates the Shakespearian scholar Halliwell-Phillipps. The chapel of the gild of the Holy Cross was begun by Robert de Stratford. The gild, for both sexes, was in existence early in the 13th century, and was incorporated by charter from Edward III. in 1322. It was dissolved in 1547. The gildhall is a picturesque half-timbered building. A beautiful 16th century house belonged to Thomas Rogers, whose daughter was mother of John Harvard, founder of Harvard college, U S.A. Among public buildings are the town hall (1633, rebuilt 1767, altered 1863), market house, corn-exchange and three hospitals. There are recreation grounds Brewing is carried on, but the trade is principally agricultural. Area, 4,013 acres.

Shakespearian Connexion.—The task of preserving for modern eyes the buildings which Shakespeare saw was not entered upon till the end of the 18th century, when much of the visible connexion with his times had been destroyed. A room is by tradition shown as his birth-room, bearing innumerable signatures, among which such names as Walter Scott, Dickens and Thackeray may be deciphered. Part of the building, used by the poet's father as a wool-shop, is fitted as a museum. Shakespeare may have attended the grammar school in Church street, a foundation in connexion with the gild of the Holy Cross, but refounded after the dissolution by Edward VI. in 1553, and bearing his name. The site of "New Place," built by Sir Hugh Clopton and bought by Shakespeare in 1597, was acquired by public subscription, chiefly through the exertions of Halliwell-Phillipps, and handed over to the trustees in 1876. Shakespeare is buried in the chancel of Holy Trinity church next his wife. Over his grave are the lines beginning

Good friend, for Jesus' sake forbeare
To digg the dust enclosed heare

For the effigy *see* SHAKESPEARE· *Portraits* Further connexions with the poet and his family are to be found. The museum adjacent to New Place was the house of Thomas Nash, who married Shakespeare's granddaughter Elizabeth Hall At Shottery, 1 m W. of Stratford, is the thatched cottage in which Shakespeare's wife, Anne Hathaway, was born It was purchased for the nation in 1892. The poet's mother was Mary Arden, and this name, that of an ancient county family, survives in the 'Forest' of Arden, north-west of Stratford At Snitterfield to the north lived Shakespeare's grandfather and uncle.

The principal modern monument to the poet's memory is the Shakespeare Memorial, erected in 1877 to contain a theatre, picture gallery and library. Of this the theatre was destroyed by fire on March 6, 1926, and a national fund was opened to build a new one. A Shakespearian season is given annually

History.—Stratford is a place of great antiquity A Roman road may have run past the site, coins, etc, have been found, and the district at any rate was inhabited in Roman times The manor was granted by Offa to the bishopric of Worcester; and it was under the protection of the bishops of Worcester that the inhabitants of the town early assumed burghal rights The Gild of the Holy Cross, founded in the 13th century for the support of poor priests and others, exercised authority over the town for many years. Its dissolution was the cause of the incorporation charter of Edward VI. in 1553, by which the town was incorporated under the title of the bailiff and burgesses, who were to bear the name of aldermen. Another charter, altering the constitution of the corporation, was granted in 1611.

STRATHAVEN (locally pronounced *Strĕvn*) a manufacturing and market town of Lanarkshire, Scotland. Pop. (1921) 4,207. It lies on the Avon, 16 m. S S.E. of Glasgow by road, and is the terminus of the L.M.S. railway company's branch line from Hamilton. It has manufactures of silk, cotton and hosiery and is a market for cheese and grain. The ruins of Avondale castle are situated on a stream that runs through Strathaven to join the Avon, a mile below the town Six miles S.W, on the moor of Drumclog, the Covenanters defeated John Graham of Claverhouse, Viscount Dundee, on June 1, 1679. A granite obelisk commemorates the battle.

STRATHCLYDE, the name given in the 9th and 10th centuries to the British (Welsh) kingdom, which from the 7th century onwards was probably confined to the basin of the Clyde, together with the adjacent coast districts, Ayrshire, etc., on the west of Scotland. Its capital was Dumbarton (fortress of the Britons), then known as Alcluith. On the south this kingdom bordered on the territories of the Niduari Picts of Galloway, including the modern counties of Wigtown and Kirkcudbright. Strathclyde is also sometimes called Cumbria, or Cumberland, and the survival of the latter name on the English side of the border preserves the memory of a period when the territories of the northern Welsh

were of much greater extent.

After the withdrawal of the Romans in the 5th century the northern Britons seem to have shown greater determination in maintaining their independence than any of the southern kingdoms and, according to Welsh tradition, Cunedda, the ancestor of the kings of Gwynedd, had himself come from the north. In the *Historia Brittonum* we read of princes of the northern Britons.

Such notices as we have of the history of Strathclyde in the 7th and 8th centuries are preserved only in the chronicles of the surrounding nations and even these supply us with little more than an incomplete record of wars with the neighbouring Scots, Picts and Northumbrians. It is probable that the Britons were allied with the Scots when Aidan, the king of the latter, invaded Northumbria in A.D. 597. In 642, however, we find the two Celtic peoples at war with one another, for in that year the Britons under their king Owen defeated and slew the Scottish king Domnall Breac. In the same year they came into conflict with the Northumbrian king Oswio. In 649 there appears to have been a battle between the Britons and the Picts, but about this time the former must have become subject to the Northumbrian kingdom. They recovered their independence, however, after the defeat of Ecgfrith by the Picts in 685. In 711 and again in 717 we hear of further wars between the Britons and the Scots of Dalriada, the former being defeated in both years. Towards the middle of the 8th century Strathclyde was again threatened by an alliance between the Northumbrians and Picts, and in 750 the Northumbrian king Eadberht wrested from them a considerable part of their territories in the west including Kyle in Ayrshire. In 756 the North Britons are said to have been forced into submission and from this time onwards we hear very little of their history.

In 870 Dumbarton was attacked and destroyed after four months' siege by the Scandinavian king Ivarr, and for some time after this the country was exposed to ravages by the Norsemen. It is believed that the native dynasty came to an end early in the 10th century and that the subsequent kings belonged to a branch of the Scottish royal family. Toward the end of the reign of Edward the Elder the Britons of Strathclyde submitted to that king together with all the other princes of the north. In the reign of his successor Aethelstan, however, they joined with the Scots and Norwegians in attempts to overthrow the English supremacy, attempts which were ended by their defeat at the battle of Brunanburh in 937. In 945–946 Strathclyde was ravaged by King Edmund and given over to the Scottish king Malcolm I. The fall of the kingdom was only temporary, for we hear of a defeat of the Scottish king Cuilean by the Britons in 971. In the 11th century Strathclyde appears to have been finally incorporated in the Scottish kingdom, and the last time we hear of one of its kings is at the battle of Carham in 1018 when the British king Owen fought in alliance with Malcolm II.

(F. G. M. B.)

STRATHCONA AND MOUNT ROYAL, DONALD ALEXANDER SMITH, BARON (1820–1914), Canadian statesman and financier, was born at Forres, Scotland, on Aug. 6, 1820, the second son of Alexander Smith (d. 1850), a Highland merchant. His mother, Barbara Stewart, of Abernethy, was the sister of John Stewart (d. 1847), a famous fur trader in the Canadian North-West, who gave his name to Stewart Lake and Stewart river. Through him Donald Smith was appointed in 1838 a junior clerk in the Hudson's Bay Company, which at that time controlled the greater part of what is now the Dominion of Canada. Smith was sent to Labrador, and stationed at Hamilton Inlet. For thirteen years he roughed it there, mastering the work of the fur trade, introducing various improvements into the conditions of life, being the first to prove that potatoes and other vegetables could be grown with success on that bleak coast, and varying his business routine with much reading and letter-writing. Then he was for ten years on Hudson Bay, rising in the company's service to be a chief trader and then a chief factor.

In 1868 he was appointed to the post of resident governor, with headquarters at Montreal. In the next year Louis Riel's (*q.v.*) rebellion broke out on the Red river, and in December Smith was sent by the Canadian government with wide powers as special commissioner to endeavour to check the rebellion, and to report "on the best mode of quieting and removing such discontent and dissatisfaction." On arriving at Fort Garry (now Winnipeg) he advised the government that it would be necessary to send troops; in the meanwhile he kept cool in face of a very ugly situation, and it was largely owing to his tact and diplomacy that the lives of the numerous prisoners were saved, that Riel's position was gradually undermined and that the relief expedition under Colonel (afterwards Lord) Wolseley had no fighting to do. Apart from the rebellion, there was difficulty with the company's traders. The company's control over the North-West was to be surrendered to Canada for £300,000, certain grants of lands and certain trading privileges, and the traders on the spot feared that in the distribution of the money their rights might not be guarded, but Smith succeeded in persuading them to trust him to secure their share, and asserted their claims so effectually that £107,000 was paid to them. During these complications in the North-West he occupied for a time the position of acting governor: in December 1870, he was returned for Winnipeg to the Manitoba legislative assembly, and in March 1871, he was elected as one of the four Manitoba representatives to the Dominion House of Commons. In 1871 Smith was appointed chief commissioner for the North-West. In 1872 he became one of the original members of the first North-West council under the act providing for the government of the territories by the lieutenant-governor of Manitoba and a council of eleven.

The construction of the Canadian Pacific railway had now become a practical question. In 1872 a charter was given by Sir John Macdonald's government to a company, with Sir Hugh Allan at its head, for the construction of the line, with a subsidy in land grants and money, but in 1873 disclosures of corrupt practices in relation to this charter (the so-called Pacific Scandal) led to the fall of the government, and the company was soon afterwards dissolved. In the debate which ended in the resignation of the government, a speech by Smith had a powerful effect. The Liberal government which came into power early in 1874 reverted, though timidly, to the policy of government ownership.

Meanwhile Donald Smith, together with his cousin Mr. George Stephen (afterwards Lord Mountstephen), and other Canadian and American financiers, had bought out the Dutch bondholders of the insolvent St. Paul & Pacific railway, an American line, which by 1873 had been completed from St. Paul to Breckenridge, but which lacked funds to proceed farther. After long negotiations the new owners persuaded the government of Manitoba to build a line from Winnipeg to Pembina on the American frontier. This done, in 1879 the partners formed the St. Paul, Minneapolis & Manitoba Railway Company, and by continuing the line from Breckenridge to Pembina united Manitoba with the south and west.

In 1878 the Liberal party was defeated, and Sir John Macdonald returned to office with the support of Smith, who had been driven to rejoin the Conservatives by the over-cautious railway policy of the Liberals. In 1880 the new government made a contract for building the railway with a syndicate of which Stephen was the chief director, and in which Smith, from the first largely interested, came more and more to the front. Both were prominent directors of the Bank of Montreal, and employed its resources in the work without hesitation. Smith also embarked in the work the whole of his private fortune, and it was his dogged perseverance which more than anything else enabled the company to bring its work to a successful conclusion. On Nov. 7, 1885, at Craigellachie in the Rocky Mountains, Donald Smith drove home the last spike of the first Canadian transcontinental railway. In 1882 he left parliament, but returned to it in 1887, and represented Montreal West till 1896, when he was appointed to succeed Sir Charles Tupper in London as high commissioner for Canada. In that year he was made G.C.M.G.; in 1897 he was raised to the peerage and in 1909 made G.C.V.O. In 1889 he became governor of the Hudson's Bay Company. On March 21, 1896 he was appointed government commissioner to Manitoba

and the Territories to endeavour to lessen the bitterness in the discussion as to Roman Catholic rights in the public schools, and the compromise of 1897 followed the lines which he suggested. (*See* CANADA.)

In January 1900, during the war in South Africa, he raised, equipped and presented to the British government a regiment of irregular cavalry 600 strong. Strathcona's Horse, as it was called, was recruited in the Canadian West, and did good service during the war With his cousin, Lord Mountstephen, he founded and endowed the Royal Victoria Hospital in Montreal, and both in Canada and in Scotland gave largely to university work He was the backbone of the Canadian emigration policy from 1896 onwards. He helped in the improvement of the waterways of the Canadian West, and in placing steamers on them, and gave much assistance to the proposed All Red Route of British-owned steamers, encircling the world From the first he was a member of the Pacific Cable Board, controlling the cable laid in 1902 by the combined governments of Great Britain, Canada and Australia No man did more to tighten the ties which bind Canada to the British Empire. He died in London on Jan. 21, 1914.

The *Life* by Beckles Willson contains some useful information. The Histories of the Hudson's Bay Company by Beckles Willson, Rev. George Bryce and Miss Agnes C Laut tell his early struggles. *Sir Wilfrid Laurier* (2 vols), by J S. Willison, describes the financial dealings between the Canadian government and the Canadian Pacific railway His parliamentary speeches are to be found in the Canadian *Hansard.*

STRATHNAIRN, HUGH HENRY ROSE, 1ST BARON (1801–1885), British field-marshal, third son of the Right Hon. Sir George Henry Rose of Sandhills, Christchurch, Hants., minister plenipotentiary at the Prussian court, was born at Berlin on April 6, 1801. He was educated at Berlin, and received military instruction at the cadet school. He entered the army in 1820, and received rapid promotion As a major in the 92nd Highlanders he was employed in maintaining order in Ireland in 1830. He then served in the Mediterranean In 1840 Rose, now a lieutenant-colonel, was selected, with other officers and detachments of Royal Artillery and Royal Engineers, for special service in Syria under the orders of the foreign office They were to co-operate on shore, under Brigadier-General Michell, R.A.—in conjunction with the Turkish troops—with the British fleet on the coast, for the expulsion of Mohammed Ali's Egyptian army from Syria Sir Stratford Canning sent Rose from Constantinople on a diplomatic mission to Ibrahim Pasha, commanding the Egyptian army in Syria, and after its execution he was attached, as deputy adjutant-general, to the staff of Omar Pasha, who landed at Jaffa with a large Turkish force from the British fleet. Rose distinguished himself in several engagements, and received many honours. Shortly after he succeeded to the command of the British detachment in Syria with the local rank of colonel, and in April 1841 he was appointed British consul-general for Syria. For seven years, amidst political complications and intrigues, Rose, by his energy and force of character, did much to arrest the horrors of civil war, to prevent the feuds between the Maronites and Druses coming to a head, and to administer justice impartially; and he saved many Christians from massacre

In 1848 he left Syria on leave, and did not return, as Lord Palmerston appointed him secretary of embassy at Constantinople in January 1851 In 1852 he was chargé d'affaires in the absence of Sir Stratford Canning during the crisis of the question of the "holy places" During the Crimean War Rose was the British commissioner at the headquarters of the French army, with the local rank of brigadier-general For his services he received the medal with three clasps and the thanks of parliament, was promoted to be major-general, and was made K C B and commander of the Legion of Honour. On the outbreak of the Indian Mutiny in 1857 Rose was given command of the Poona division He arrived in September, and took command of the Central India force. In January 1858 he marched from Mhow, captured Rathgarh after a short siege, and defeated the raja of Banpur near Barodia in the same month He then relieved Saugor, captured Garhakota and the fort of Barodia, and early in March defeated the rebels in the Madanpur Pass and captured Madanpur and Chanderi He arrived before Jhansi on March 20, and during its investment defeated a relieving force under Tantia Topi at the Betwa on April first. Most of Rose's force was locked up in the investment, and to Tantia Topi's army of 20,000 he could only oppose 1,500 men; yet with this small force he routed the enemy with a loss of 1,500 men and all their stores Jhansi was stormed and the greater part of the city taken on the 3rd, and the rest the following day, and the fort occupied on the 5th Kunch was captured, after severe fighting in a temperature of 110° in the shade, on May 7 Under the same conditions the march was made on Kalpi. The rebels attacked his small force, exhausted by hard marching and weakened by sickness, but after a severe fight (May 22) they were utterly routed and Kalpi occupied the following day Sir Robert Napier (*q v*) had been appointed to succeed him, when news came of the defection of Sindhia's troops and the occupation of Gwalior by Tantia Topi. Rose at once moved on Gwalior by forced marches, and on June 16 won the battle of Morar Leaving Napier there, he attacked Gwalior on the 19th, when the city was captured. The fortress was stormed and won the following day, and Napier gained a signal victory over the flying enemy at Jaora-Alipur on the 22nd Rose then made over the command to Napier and returned to Poona. It was to Rose's military genius that the suppression of the Indian Mutiny was largely due; but owing to official jealousy his merit was only tardily recognized. But in June 1860 he succeeded Lord Clyde as commander-in-chief in India. Rose improved the discipline of the army, and his powerful assistance enabled the changes consequent upon the amalgamation of the East India Company's army with the Queen's army to be carried out without friction

Rose held the Irish command from 1865 until 1870, and by a good organization and disposition of the troops under his command in 1866 and 1867 he enabled the Irish government to deal successfully with the Fenian conspiracy. He was promoted general in 1867, and field marshal in 1877 He died in Paris on Oct. 16, 1885, and was buried in the graveyard of the Priory Church, Christchurch, Hants An equestrian statue by E Onslow Ford, was erected to his memory at Knightsbridge, London.

See Sir Owen Tudor Burne, *Clyde and Strathnairn,* "Rulers of India Series" (1891).

STRATHPEFFER, village and spa of the county of Ross and Cromarty, Scotland, 5 m. W. of Dingwall by a branch of the L M S railway. Pop. (1921), 875. It lies in a valley, sheltered on the west and north. There are several sulphurous and chalybeate springs, in great repute for the cure of rheumatism, skin diseases and anaemia, and Strathpeffer is a popular resort. The ascent of Ben Wyvis is commonly made from Strathpeffer.

STRATHSPEY, Scottish dance believed to have had its origin in the 18th century in the valley, or strath, of the Spey, whence its name

STRATIGRAPHY is a branch of science which may be defined as the study of the relative position and order of succession of deposits containing or separating archaeological material

Observation of strata is now acknowledged to be as fundamental to archaeology as the equivalent study of the superposition of rocks and their fossil contents is to geology.

Stratified deposits may be classified under three main headings (1) Archaeological, (2) Archaeological and Geological, (3) Geological.

(1) A purely artificial accumulation, as on a town or settlement site of historic or comparatively late prehistoric age. In this case superposed buildings may amplify the stratigraphical information obtained primarily from pottery sequences.

The section through the Temple of Artemis Orthia at Sparta (fig. 1) is a fine example of stratigraphical work yielding chronological information covering at least 1,000 years. Study of this section shows the older deposits divided from the newer by a sand stratum The lower levels, (a) and (b), dated by their respective potteries, cover the period of an early temple represented by an altar and walls. The sacrificial deposits are of unequal thickness on both sides of the altar, indicating that one side was kept clear for officiation The altar was therefore in exist-

ence while the surrounding strata were accumulating. Contrasted with this is the uniformity of level near the walls, showing that these are more recent than the deposits through which they were cut. This early temple appears to have been destroyed by flood, and our next period (c) belongs to rebuilding in the 6th century B.C. The site was artificially levelled up by a sand deposit of 1½ metres thick in order to raise the new temple above flood level.

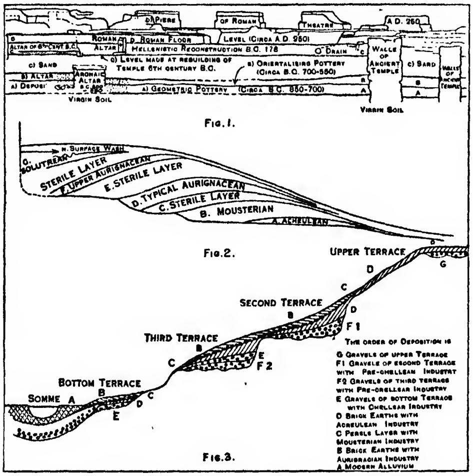

FIG. 1.—SECTION OF SANCTUARY OF ARTEMIS ORTHIA, SPARTA. (AFTER BRITISH SCHOOL OF ATHENS); FIG. 2.—SECTION OF ROCK SHELTER OF LAUSSEL. (AFTER LALANNE); FIG. 3.—CROSS SECTION OF RIVER SOMME. (AFTER COMMONT)

The Greek altar and associated deposits belong to this period. This building remained in use until a Hellenistic reconstruction about 178 B.C. (d) The Roman period is superimposed, beginning about 350 years later; that the Hellenistic temple was then still in use is suggested by the Roman altar; also by the position of a Roman theatre, built *around* the temple area. Inscriptions, ranging from the 4th century B.C. to A.D. 225 built into the foundations of the theatre prove that it can hardly be earlier than A.D. 250, since a stele is unlikely to have been thrown aside less than 25 years after its erection.

(2) A combination of natural and artificial conditions, best exemplified by cave deposits, showing strata of early human occupation, interbedded with strata of geological formation such as stalagmitic floor, or flood-borne silt. Caves (*q.v.*) and rock-shelters were primitive man's abode both before, during, and after the last great ice-age. Here he left his flint and bone implements (not less valuable to archaeologists as period-indicators than the pottery remains of later times), his hearths and the bones of wild beasts killed for food, unconsciously building up, little by little, over a period of many thousand years, in conjunction with geological agencies, a stratigraphy as certain as a town mound. Cave deposits may attain a vertical depth of 45ft. The inequalities of a cave floor render it improbable that the superimposed deposits will be horizontal or evenly distributed. In many cases one well-defined stratum of a series may contain relics of more than one period, and the level in it, at which archaeological transition or change becomes apparent, may be missed unless suitably fine horizontal sub-divisions have been made by the excavator.

In the section through the Rock Shelter at Laussel, S. France (fig. 2) we see strata tilting and overlapping. The oldest deposits (a) and (b) of lower and middle palaeolithic age lie some distance from the sheltering cliff. There follows a long interval (c) when the site was abandoned and cliff detritus and humus raised the level. (d) Upper palaeolithic man returned and resumed discontinuous occupation (f) and (h). Deposits (a)–(h) cover probably a period of at least 25,000 years. The section illustrates interestingly the confusion in interpretation of sequence which would result from unsuitable methods of excavation such as a horizontal trench driven in from the side.

Stratigraphical conditions such as (1) and (2), each with numerous variants, fall within the domain of archaeology. There comes, however, a point at the beginning of the human record when archaeological stratigraphy merges into pure geology. (3) River-terrace gravels illustrate this category.

The major river valleys frequently show old terraces of sand and gravel occurring at various heights above the present stream. These mark former levels of the river when the flow of water was augmented either actively by periods of increased rainfall, or by the melting of glaciers, or passively by change of valley slope, or variation of sea-level. In many cases these old terraces contain fossil animal remains and palaeolithic flint implements of different ages. In the case of river gravels, however, the usual law of stratigraphical sequence as shown in (1) and (2) is inverted; the highest terrace will normally (though not invariably) have been deposited first, and will contain the oldest material, whilst the formation of the lower terraces will be episodes in the later degradation of the river bed. Material from the older deposits may consequently be washed into the later ones; the true age of an alluvial deposit is that of its most recent content.

The cross-section of the Somme near St. Acheul, France (fig. 3) shows that river gravel stratigraphy is rendered additionally complex by reason of over-lying deposits of later date which cover older and younger terraces alike, containing in their turn archaeological material.

See J. P. Droop, *Archaeological Excavations* (1906). (G. C.-T.)

STRAUBING, a town in the republic of Bavaria, on the Danube, 25 m. S.E. of Regensburg, by rail to Passau. Pop. (1925) 23,593. Straubing is a town of remote origin, believed to be identical with the Roman station of *Sorbiodurum.* In definite history, however, it is known only as a Bavarian town, and from 1353 to 1425 it was the seat of the ducal line of Bavaria-Straubing. Its oldest building is the tall square tower dating from 1208. It has eight Roman Catholic churches, among them being the church of St. James, a handsome Late Gothic edifice, the old Carmelite church and that of St. Peter. It has also a Gothic town hall, and a castle. The industries are iron and tin founding, tanning and brewing, the manufacture of machinery and chemicals and trade in wine and cattle.

STRAUSS, DAVID FRIEDRICH (1808–1874), German theologian and man of letters, was born at Ludwigsburg, near Stuttgart, on Jan. 27, 1808. He was educated at the evangelical seminary of Blaubeuren and at the university of Tübingen. After a short interval of teaching he went to Berlin (1831), but Hegel died just at the time of his arrival, and of Schleiermacher's lectures only those on Jesus interested him. But he mixed with the disciples of Hegel, and conceived the main idea of his two great works—the *Leben Jesu* and the *Christliche Dogmatik.* He returned to Tübingen, where he lectured for a time, but soon found it necessary to give his whole energies to the preparation of his book, the *Leben Jesu* (1835). The work produced an immense sensation by its destructive method. In 1837 Strauss replied to his critics (*Streitschriften zur Verteidigung meiner Schrift über das Leben Jean*). In the third edition of the work (1839), and in *Zwei friedliche Blätter,* he made important concessions to his critics, which he withdrew, however, in the fourth edition (1840; translated into English by George Eliot, with Latin preface by Strauss, 1846). In 1840 and the following year he published his *Christliche Glaubenslehre* (2 vols.), the principle of which is that the history of Christian doctrines is their disintegration.

Between the publication of this work and that of the *Friedliche Blätter* he had been elected to a chair of theology in the university of Zürich. But the appointment provoked such a storm of popular ill will in the canton that the authorities pensioned him off before he was installed. With his *Glaubenslehre* he took leave of theology for upwards of twenty years. He then published a series of biographical works, which secured for him a permanent place in German literature (*Schubarts Leben,* 2 vols., 1849;

Christian Märklin, 1851; *Nikodemus Frischlin,* 1855; *Ulrich von Hutten,* 3 vols, 1858–1860, 6th ed 1895; *H. S. Reimarus,* 1862).

With this last-named work he returned to theology, and two years afterwards (1864) published his *Leben Jesu fur das deutsche Volk* (13th ed, 1904) His *Christus des Glaubens und der Jesus der Geschichte* (1865) is a severe criticism of Schleiermacher's lectures on the life of Jesus, which were then first published. From 1865 to 1872 Strauss resided in Darmstadt, and in 1870 published his lectures on *Voltaire* (9th ed, 1907). His last work, *Der alte und der neue Glaube* (1872; 16th ed, 1904; English translation by M. Blind, 1873), caused some consternation among his friends. Like all his critical works it suffered from his lack of critical study of the texts themselves.

AUTHORITIES.—Strauss's works were published in a collected edition in 12 vols, by E. Zeller (1876–78), without his *Christliche Dogmatik* His *Ausgewahlte Briefe* appeared in 1895. On his life and works, see E Zeller, *David Friedrich Strauss in seinem Leben und seinen Schriften* (1874); A. Hausrath, *D F Strauss und die Theologie seiner Zeit* (2 vols, 1876–78), F J Vischer, *Kritische Gange* (1844), vol i, and by the same writer, *Altes und Neues* (1882), vol. iii.; R. Gottschall, *Literarische Charakterkopfe* (1896), vol iv; S. Eck, *D. F. Strauss* (1899), K Harraeus, *D F. Strauss, sein Leben und seine Schriften* (1901); and T. Ziegler, *D F. Strauss* (2 vols, 1908–09)

STRAUSS, JOHANN (1804–49), Austrian orchestral conductor and composer of dance-music, was born at Vienna on March 14, 1804. He began as violinist in a small orchestra and then, after acting for a time as deputy conductor, formed a small band of his own, which he introduced to the Vienna public during the carnival of 1826 at the Schwan, in the Rossau suburb, where his famous *Täuberl-Walzer* (op 1) at once established his reputation as the best composer of dance-music then living Later he was appointed kapellmeister to the 1st Burger Regiment, and charged with the duty of providing the music for the court balls. With the growth of his fame so did the size of his orchestra increase until it ultimately numbered over 200 performers In 1833 he began a long series of tours throughout northern Europe, eventually visiting England in 1838. Back in Vienna, he appeared eventually in the Imperial Volksgarten, which thenceforth became the scene of his most memorable successes, his conducting being marked by a quiet power which ensured the perfection of every minutest *nuance*. He revisited London in 1849, and, after his farewell concert, was escorted down the Thames by a squadron of boats, in one of which a band played tunes in his honour This was his last public triumph. He died in Vienna on Sept. 25, 1849.

Strauss was survived by three sons—Johann (1825–99), Joseph (1827–70) and Eduard (1835–1916), all distinguished as composers of dance-music To Johann was due the most famous of all the waltzes associated with the name of the family, *An der schönen blauen Donau* (*The Blue Danube*), and many popular operettas, of which *Die Fledermaus* is the best known.

STRAUSS, RICHARD (1864–), German composer, was born at Munich on June 11, 1864, the son of Franz Strauss, an eminent hornist. To some extent a prodigy, Strauss was something of a pianist at four, a composer at six, and at ten he was already seriously studying music under F W Meyer He had passed through the gymnasium and the university, and his music studies had been thorough. To Bulow, and even more to Alexander Ritter, Strauss owed the awakening in his own mind of the interest in the modern development of music.

In 1885 Strauss succeeded Bulow as conductor of the Meiningen orchestra, but the appointment was held only for a few months, since in April of this year Strauss resigned his post in order to travel in Italy, and on his return in the early autumn he became 3rd conductor of the Munich Opera under Hermann Levi Four years later he was installed in Weimar as Hofkapellmeister, but once again he held his post for only a brief period, for in 1894, the year of his marriage to Pauline de Ahna, the eminent singer, he was promoted to be 1st conductor at Munich. Between these various appointments and that of Hofkapellmeister in Berlin (1899) Strauss travelled considerably in the Near East and over Europe. He conducted a performance of *Elektra,* in Beecham's season at Covent Garden in the spring of 1910, and again in 1913 (when his *Ariadne auf Naxos* was given at His Majesty's), in 1914 (when he conducted his *Legend of Joseph* at Drury Lane), in 1923 and 1926.

Of the early period of Strauss the composer there is little of importance to be said. Indeed it has often been said that signs of the real Strauss are not to be perceived before his *Don Juan* (op. 20) and *Macbeth* (op 23) A year only divided *Macbeth* (1887) from *Don Juan* (1888) *Tod und Verklärung* (1889) is a sensational work. Between it and *Till Eulenspiegels lustigen Streiche* (1894), Strauss's first opera, *Guntram,* finds place (first performance, Weimar, 1894), the latter a work that in spite of much *réclame* for the composer failed to hold a position upon the stage. In *Till Eulenspiegel,* one of the most brilliantly clever scores ever penned, is to be found a sense of fun that is worthy of note (as of emulation), and it is perhaps worth recording that no more noteworthy example of the rondo form exists in modern music, while its approximate successor, *Don Quixote* (1897), is an equally outstanding example of the variation. In *Don Quixote* (1897) his zenith as a musical realist was reached In between came another symphonic poem on the most ambitious scale inspired by and named after Nietzsche's *Also sprach Zarathustra* (1895), which stirred up more temporary strife than any of its predecessors, if not so much perhaps as was aroused later by the production of *Ein Heldenleben* (1898), or by the comparatively ingenuous *Symphonia domestica* (1904)

Up to 1910 Strauss had composed four operas Of these *Guntram* was on frankly Wagnerian lines and had little success, *Feuersnot,* on the other hand, despite the fact that it is largely in the nature of a satirical skit at the expense of Munich and its citizens, remained sufficiently alive to have merited performance at His Majesty's theatre, London, under Thomas Beecham's direction in July 1910. At Covent Garden in March 1910 *Elektra* was played to crowded houses and aroused great discussion by reason of what was then regarded as its unbridled violence and sensationalism And later came the not less novel and startling setting of Oscar Wilde's *Salome*, first produced at Dresden in 1905 and afterwards performed at Covent Garden

A still more important work than any of these was the gay and melodious *Der Rosenkavalier,* which has at the same time such depths of tenderness and romance, which was first brought out at Dresden in 1911 and since then has won friends in all parts of the world. Later came *Ariadne auf Naxos,* forming part originally of a semi-musical setting of Molière's *Le Bourgeois Gentilhomme* but subsequently re-arranged as an independent work This was followed after the dramatic ballet *The Legend of Joseph,* by *Die Frau ohne Schatten* (*The Woman without a Shadow*), first heard at Vienna in 1919 and containing some of the finest music which the composer has written for the stage; to which were subsequently added a "comic play-opera" *Intermezzo* (with text by the composer) and a ballet-pantomime *Schlagobers* (*Whipped Cream*), both produced at Vienna in 1924, and another opera *Helen of Egypt,* first performed in 1928

In addition to his operas and big orchestral works Strauss has written also many songs, including some of the finest quality Not a few of the hundred and more of them could be cited indeed in support of his claim to be regarded as a true descendant of the royal line of German song writers

STRAVINSKY, IGOR FEDOROVICH (1882–), Russian composer, was born at Oranienbaum, near Leningrad, on June 5 (old style), 1882. He first studied law, and it was on Rimsky-Korsakov's advice that he finally made music his career. His first work, a symphony, was followed by other orchestral pieces. In 1910 he wrote his first ballet, *The Firebird,* for Diaghilev's Russian company, with which he was afterwards so closely associated. This made an immense impression on musicians and the public by the extreme novelty of its construction It was followed by *Petrushka* (1912), usually considered his masterpiece, and *Le Sacre du printemps,* which was produced in 1913 in Paris. He then wrote an opera on Andersen's "The Nightingale" (1914). This was not a success, and in 1917 he re-wrote the second and third acts as a symphonic poem, "The Song of the Nightingale," and also staged it as a ballet. Next came *Renard* (1915), *L'Histoire du Soldat* (1917), *Pulcinella,* a

ballet with songs after Pergolesi, performed in Paris in 1920, a one-act opera *Mavra* (1921) and *Les noces villageoises* (1923).

His latest oratorio-opera, *Oedipus Rex* (1928), possesses some features of remarkable interest. In it he goes back to classical drama, achieving at last almost complete objectivity. The dramatic interest resides in the vocal parts, the orchestra providing often a mere accompaniment of transparent texture and moving statuesquely, with practically no thematic development and a preponderance of wind over strings. The text is in Latin and the chorus is a male one. Against this sober background the solo voices are treated with extraordinary freedom. To the year 1928 belongs the remarkable ballet, *Apollo Musagetes.*

Besides his works for the stage he has written a symphony for wind instruments (1920), rag-time for small orchestras, Concertino for string quartets, *Pribaoutki* (Chansons plaisantes) for voice and eight instruments, *Berceuses du chat* for voice and three clarinets; *Etude* for pianola; *Pastorale,* wordless song with piano; rag-time music and a sonata (1925) for piano, etc.

STRAW AND STRAW MANUFACTURES. Straw is the generic name applied to the dried stems or stalks of certain cereals such as wheat, barley, oats and rye.

The first use of straw was probably as bedding or floor coverings for mankind or as fodder and litter for cattle. The value of straw for cattle was early recognized, for in making conditions of land tenure, it was, and still is, customary to prohibit the removal of the straw residue which, as litter, became the only fertilizing agent. Thatching for primitive shelters and body coverings for man were some of the succeeding utilitarian developments. Straw is now the raw material of many important industries, viz.—mat-making; the stuffing of bedding; the weaving of hats, plaits and baskets; twisting into ropelike bands for tying up sheaves and trusses of corn and hay and for rolling into "skeps" or beehives; for various methods of ornamentation; for the making of pulp for paper and the species of card board known as strawboard and the making of "envelopes" for the protection during transit of glass and earthenware. The two most important of these industries are the making of paper and strawboard and the weaving of plaits and hoods for hat making. For paper and strawboards any kind of straw can be used, the stalks are subjected to a chemical maceration and filtration, until the resultant pulp can be brought through the various necessary rolling mills.

In the plait and hood industry throughout the world, cereals are specially grown and carefully selected for good colour, length, lightness in weight and toughness. Certain soils are necessary for the growth of straw fulfilling these requirements. These are found in Beds., Bucks. and Herts., in England; Tuscany in Italy; on the eastern seaboard of China and in nearly all parts of Japan. These various centres employ different means of cultivation and of treatment of the stalks after growth. In England the wheat crop destined for plait is carefully mown by hand with a sickle or scythe, the stalks when thoroughly ripened are tied up, just below the ears, into small sheaves, the loose leaves at the knots are removed by means of a special comb, leaving only the pipes of the straw which are finally cut up into suitable lengths between the knots. In Tuscany, before the grain is fully ripened, the stalks are pulled up by the roots and spread out to be dried and bleached in the sun. The upper part of the stalk down to the first knot, being exposed to the elements during growth, develops a colour known as "Tuscan" and is termed *punta* or point. This part of the straw is used for making the well-known "Leghorn" hats, as well as for plaits of many designs under the generic name of "Tuscan." The lower portion of the stalk, when denuded of its sheath, is of a pearly white colour and is called the *pedale* or foot. This is lighter in weight than the *punta* and is utilized for hats and plaits of high quality under the name of "Pedal." China and Japan follow these methods as the nature of the straw or the soil may require.

Varieties of Straw Hats.—Straw hats comprise: (1) those made of plaits sewn in overlapping rows either by hand or machine, (2) those woven like a basket called hoods, (3) those, like the "Leghorn" which are made of plaits laid edge to edge. These last have, for fixing the rows of plait together, a fine cord threaded through the loops resulting from each bend of the strand of straw at the turn of the pattern, which when tightened interlocks the rows in such a manner as to conceal the cord entirely, forming when finished practically a flat surface, while the sewn hats, having each row overlapping the next with the stitch taken through, present a fuller and richer appearance. Hoods are woven in various "wattle" and "criss cross" patterns of plain or fanciful nature. All methods commence at the centre of the top of the crown and the starting spiral or knot is termed the "button." In addition to the "Panamas" and "Brazilians," there are the Yedda, Hemp, Raffia, Bowen, Buntal Rush, Java, Bankok and Manila Hoods which, although in the plait and hat trade are called straws are of other vegetable fibres. They are all of exotic growths; the well known "Panama" derives its name from the locality from which it was first exported 300 years ago; the area of its production has since greatly extended, Ecuador and Colombia being now important centres of manufacture. The names of Bankoks, Brazilians, Javas and Manilas announce their source; yeddas and bowens come principally from Sumatra; rush hats are made in vast quantities in China; raffias emanate from the islands of the Caribbean Sea; Hemps of all kinds of patterns in plaits and hoods come from Switzerland, Italy, China and Japan. Hats such as "Panamas" and "Brazilians" have also been made at European centres, viz., St. Albans (England), Dresden (Germany), and Nancy (France), from fibres of exotic origin.

The making of plaits or braids for sewing to shape is of much more recent origin than the weaving of hats or hoods and this development was introduced into Scotland by Mary Queen of Scots in 1552. After the accession of her son, James I., to the English throne, the industry migrated towards the south and settled in the district between Dunstable (Bedfordshire) and Hemel Hempstead (Herts.) in the early days of the 17th century. From that date hats and bonnets were all made or sewn by hand until 1870, when the first hat was machine sewn in Luton (Bedfordshire). Many machines have been invented for the sewing of plait, of which only three varieties are now extensively in use. The 1870 type machine, greatly improved, has a visible stitch similar to that of an ordinary domestic sewing machine: another type, subsequently invented, has a specially designed mechanism by means of which the concealed stitch of handsewing is closely imitated; these produce the overlapping row result, but in the third and latest machine a zig-zag stitch provides for the sewing of plaits edge to edge.

The sulphur and acid processes, for some centuries the only methods of bleaching straws, have been replaced by a process known as "Monopol," by which all tones of white, from paper to ivory, can be obtained. In like manner, the old time logwood fustic, sumae, copperas and other similar dyestuffs have been superseded by aniline and alizarine processes. Hats and hoods are stiffened with gelatine size, and after drying are blocked into the required shape with the acid of damp heat and pressure, either by hand, or by hydraulic or vacuum machines. (H. I.)

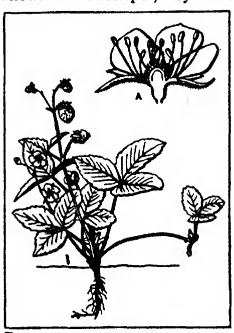

FIG. 1.—WILD STRAWBERRY (FRAGARIA VESCA), IN FLOWER AND FRUIT
A. Longitudinal section through flower (enlarged)

STRAWBERRY, in botany, a species of the genus *Fragaria,* notable for the character of the fruit. The genus consists of about ten species, native of the north temperate regions of both hemispheres, as well as of mountain districts in warmer climes; one species is found in Chile. The tufted character of the plant, and its habit of sending out long slender branches (runners) which produce a new bud at the extremity, are well known. The leaves have usually three leaflets palmately arranged, but the number of leaflets may be increased to five or reduced to one. The flower has the typical structure of members of the family Rosaceae: the so-called fruit is peculiar. The floral axis swells out into a

fleshy, dome-shaped or flattened mass in which the carpels or true fruits, commonly called pips or seeds, are more or less embedded but never wholly concealed A ripe strawberry in fact may be aptly compared to the "fruit" of a rose turned inside out

The common wild strawberry of Great Britain, which indeed is found throughout Europe and a great part of temperate Asia and North America, is *F. vesca,* and this was the first species brought under cultivation in the early part of the 17th century. Later on other species were introduced, such as *F. elatior,* a European species, the parent stock of the hautbois strawberries, and especially *F. virginiana* from the United States and *F chiloensis* from Chile. From these species, crossed and recrossed in various manners, have sprung the vast number of different varieties now enumerated in catalogues, whose characteristics are so inextricably blended that the attempt to trace their exact parentage or to follow out their lineage has become impossible The varieties at present cultivated show wide variations in the size, colour and flavour of the fruit, in season of ripening and in liability to disease

The larger-fruited sorts are obtained by crossing from *F. chiloensis* and *F. virginiana,* and the smaller alpines from *F. vesca* The alpine varieties should be raised from seeds; while the other sorts are continued true to their kinds by runners. New varieties are obtained by judicious crossing and seeding.

For further details *see* G. Bunyard, "The History and Development of the Strawberry," *Jour Roy Hortic. Soc* (1914). For cultivation *see* T. W Sanders, *Encyclopaedia of Gardening* (1912), L. H. Bailey, *Standard Cyclopedia of Horticulture* (1914–27).

STRAWBERRY-TREE (*Arbutus Unedo*), a beautiful ornamental tree of the heath family (Ericaceae, *q v*), native to southern Europe and also to south-western Ireland (Killarney), and widely planted in warm countries It grows from 10 to 30 ft. high and has smooth red bark, which peels in thin plates, and oblong, glossy, dark-green leaves The white or rose-coloured flowers, arranged in short, drooping clusters, are borne in autumn intermingled with the scarlet granular berries, about ¾ in across, which ripen only the second season after flowering. (*See* MADROÑO.)

STRAW HATS: *see* HAT MANUFACTURE

STRAYS, a term used in radio to denote electromagnetic disturbances in reception other than those produced by radio transmitting systems

STREATHAM, a large residential district in the south of London, England, within the municipal borough of Wandsworth. The name appears to indicate its position on an ancient "street" or highway. According to Domesday Book, Streatham included several manors, two of which, now Tooting and Balham, belonged to the abbot of St Mary de Bec in Normandy.

STREATOR, a city of La Salle county, Illinois, U S A, on the Vermilion river, 90 m S W of Chicago It is served by the Burlington Route, the Chicago and Alton, the New York Central, the Santa Fé, the Wabash and the Illinois Traction (electric) railways Pop 15,779 in 1920 (79% native white); estimated locally at 18,000 in 1928. It is in the heart of the corn belt and the Vermilion coal-field, and there are deposits of clay and shale The first settler in the immediate vicinity came from Virginia, in 1831. About 1860, after coal had been discovered, a village grew up along the bluff (called Hard Scrabble, from the difficult climb up from the river ford, and later Unionville) and in 1866 the Vermilion Coal Company (whose president was W. L Streator) began mining on a large scale The town was planned in 1868, incorporated as a village in 1870, and in 1882, when the population was about 6,000, was chartered as a city.

STREET, GEORGE EDMUND (1824–1881), English architect, was born at Woodford in Essex on June 20, 1824 and died on Dec 18, 1881. He was the third son of Thomas Street, solicitor He was educated at Mitcham and at the Camberwell collegiate school. In 1841 he became a pupil of Mr Owen Carter at Winchester Afterwards he worked for five years as an "improver" with Sir George Gilbert Scott in London and in 1849 began to practice on his own account At an early age Street became deeply interested in the principles of Gothic architecture, and studied the finest examples of mediaeval buildings in England and on the Continent. In 1855 he published a well-illustrated work on *The Brick and Marble Architecture of Northern Italy,* and in 1865 a book on *The Gothic Architecture of Spain*

His most important works were the nave of Bristol Cathedral, the choir of the cathedral of Christ Church in Dublin, and the new courts of justice in London for which in June 1868 Street was appointed sole architect; but the building was not complete at the time of his death He was elected an associate of the Royal Academy in 1866, and R A in 1871; and he was professor of architecture to the Royal Academy. Street was buried in the nave of Westminster Abbey.

See A. E. Street, *Memoir of G. E Street, R.A.,* 1888.

STREET CRIES. The itinerant vendor has always adopted a distinctive cry to draw attention to his wares, and, as a French writer says, the origin of these cries "se perd dans la nuit des temps." The earliest record that we possess in English is that given in the *New English Dictionary* of a cry of 1393. "Kokes and here knaues crieden hote pyes hote"—a cry which with but slight variation was preserved to the close of the 18th century The earliest collection of street cries is to be found in the 14th century poem, *London Lackpenny.* The author of this poem is, on John Stow's authority, John Lydgate (1370–1450), a Benedictine monk of the abbey of Bury St Edmunds. Among the many cries here included are those of "Hot peascods," "Strawberries ripe and cherries in the rise" *Pammelia· Musicke's Miscellanie* was published in 1600–18 and contains a number of cries, but the most important collection of the time is P Tempest's *The Cryes of Old London* (1668), a work with which Samuel Pepys was familiar In Smollett's *Humphrey Clinker* it will be recalled that the author protests against "noisy rustics bellowing 'green peas,' " and Herrick long before had introduced stray street cries in his *Hesperides.* The cries of Paris are of very remote origin and *Le Livre des Mestiers* contains examples of the time of Saint Louis, Guillaume de la Villeneuve compiled a famous collection known as *Les Crieries de Paris* As in London and elsewhere the incunabula of the street cries of Paris are rich in pictorial illustration, and the old collections provide a perfect mirror of the times Every town possesses its distinctive cries, but, save when there are enthusiasts such as Annibale Carracci (1560–1609), who has preserved those of old Bologna, these are hard to come by.

BIBLIOGRAPHY.—Charles Hindley, *A History of the Cries of London* (1881), Sir Frederick Bridge, *The Old Cryes of London* (1921), Victor Fournel, "Cries of London" in Grove's *Dictionary of Music; Les Cris de Paris* (1887). (H L Mo)

STRELITZ, a body of Russian household troops originally raised by the tsar, Ivan the Terrible, in the middle of the 16th century (*Streltsi*). They numbered 40,000 to 50,000 infantry, and formed the greater part of the Russian armies in the wars of the 16th and 17th centuries They were a fierce and ill-disciplined force, individually brave and cruel in war In 1698 they rose in mutiny for the last time Crushed in battle by Peter's general, Patrick Gordon, they ceased to exist as a military force, and about 2,000 of them were barbarously tortured and put to death

STRENGTH OF MATERIALS: *see* MATERIALS, STRENGTH OF.

STRESA, a village of Piedmont, Italy, in the province of Novara, situated on the west side of Lago Maggiore, on the Simplon railway, 10 m. N. of Arona, 673 ft above sea-level Pop. (1921), 2,051 It is remarkable for the beauty of its scenery and for its fine villas, and is a favourite health resort.

STRESEMANN, GUSTAV (1878–), German statesman, was born in Berlin on May 10, 1878, son of Ernst Stresemann, a wholesale beer merchant He was educated at the Berlin gymnasium and at the universities of Berlin and Leipzig, where he studied philosophy and political economy, and became prominent as leader of the *Allgemeiner deutscher Burschenbund.* After receiving his doctorate, he entered Saxon industry, first as assistant, afterwards as Syndic. The industry of Saxony was at the time disunited and neglected by the authorities; but Stresemann's energy promoted its union in the *Verband sächsischer Industrieller,* and its advance to the first place in the

great *Bund der Industriellen* for all Germany. The *Bund der Industriellen* was a keen antagonist of the *Zentralverband der deutschen Industrie,* the central association of the heavy industry. Stresemann's energy and capacity for organization raised his own association into a position in which it could effectively counter the "heavy industry" and agrarian influences everywhere in Germany. Simultaneously he secured for the finishing industries proper influence in the Saxon Chambers; he himself entered the German Reichstag at the age of 28. His brilliant oratorical gifts and his activity attracted the attention of Bassermann, the leader of the National Liberal party, to which Stresemann belonged. Bassermann and Stresemann were among the leading figures in the pre-war German Reichstag.

War and Revolution.—Stresemann, who became the leader of the National Liberal party in 1917, on Bassermann's death, advocated energetic prosecution of the war, while also urging that Germany should be prepared for peace, if acceptable peace terms were offered her. He was one of the sharpest opponents of Bethmann-Hollweg, whom he reproached with indecision and weakness.

After the outbreak of the revolution and the defeat of Germany, Stresemann tried to unite the forces of Liberalism in Germany, and after the failure of this attempt, founded the German People's party, as successor of the National Liberal party. This party was at first monarchist, but gradually changed to republicanism, as Stresemann himself did. In the Weimar National Assembly Stresemann voted for rejection of the Treaty of Versailles, which he considered intolerable and impossible for Germany to fulfil. The German People's party, led by him, soon, however, entered the Government, left it again a little later, and re-entered it in 1923, after which date the party, through Stresemann, exercised a strong influence over Government policy.

Reconstruction.—When the struggle in the Ruhr (*q.v.*) was at an end and the mark currency in complete collapse; when separatist movements, supported by France, in the Rhineland, Fascist movements in Bavaria and Communist movements in Saxony and Thuringia threatened German unity, Stresemann took office as chancellor and minister of foreign affairs, at the head of the so-called "Grand Coalition," embracing all parties from the Social Democrats to the German People's party. He assumed the responsibility for liquidating the battle in the Ruhr, and attempting to open up negotiations with France. The basis for this was afforded by the Dawes report. In domestic policy, this ensured the stabilization of the currency which Stresemann carried through with the help of Hilferding and afterwards Luther, as ministers of finance; it paved the way for an international loan for Germany to restart her industrial life, and fixed Germany's next payments, and called for the restoration of Germany's economic sovereignty in the Rhineland.

Stresemann resigned his Chancellor's portfolio when the Social Democrats refused to follow him, on account of the most energetic measures which he took against the Communists in Saxony. He retained the portfolio of Foreign Affairs in the succeeding cabinets formed by Marx, Luther, Marx again, and Müller. On signing the agreement based on the Dawes plan in London, Stresemann succeeded in obtaining the evacuation of the Ruhr and of the towns of Düsseldorf, Duisburg and Ruhrort, under certain conditions.

The peace policy which Stresemann—as Briand explicitly admitted—had inaugurated, led eventually to the signature of the Locarno Pact (*q.v.*), the first attempt to find a European solution on a peaceful basis, which also resulted in Germany's entry into the League of Nations. Stresemann's services in the cause of European peace were recognized by the award of the Nobel Prize. Despite many difficulties, particularly over the question of the evacuation of the Rhineland, he continued undaunted to work for the further development of peace, and was one of the first to declare his readiness to sign the Kellogg Pact.

Stresemann married Käthe Kleefeld, by whom he had two sons.

His collected speeches and writings have been issued under the title *Stresemanns Reden und Schriften* (2 vols.). *See* the biography (1928) by Rochus von Rheinbaben (Eng. trans. *Stresemann, the Man and the Statesman,* 1929). (R. Fr. v. R.)

STRETTO (It. *Strignere,* to pull close), musical term signifying the device in fugal writing whereby subject and answer are brought closer together and thereby made to overlap, the one beginning before the other is ended. (*See* Fugue.)

STREUVELS, STYN (1871–), pen name of Frank Lateur, Flemish writer, and the nephew of the priest-poet Guido Gezelle. For a long time he worked as a pastry cook at Avelghem in Flanders and then settled down at Ingoyghen, close by, in order to devote himself entirely to literature. Essentially a man of the soil, he nevertheless possessed a delicate artistic sensibility and acquired considerable literary culture. He was the most popular writer of his time in Flanders and enjoyed a great reputation in Holland, although he frequently introduces the Western Flemish dialect into his writings. Many of his novels have been translated. *De Vlaschaard* (1907) is considered his best work.

STRICKLAND, AGNES (1806–1874), English historical writer, was born in 1806, the third daughter of Thomas Strickland, of Reydon Hall, Suffolk. Her first literary efforts were historical romances in verse in the style of Walter Scott. With the assistance of her sister, she wrote *The Lives of the Queens of England* (12 vols. 1840–49) from Matilda of Flanders to Queen Anne. Agnes Strickland was a warm partisan on the side of royalty and the church, but she made industrious study of official records and public documents. Of many historical works her last was the most important—*Lives of the Last Four Stuart Princesses* (1872). In 1871 she obtained a civil-list pension of £100. She died on July 8, 1874.

A *Life* by her sister, Jane Margaret Strickland, appeared in 1887.

STRICKLAND, HUGH EDWIN (1811–53), English naturalist and geologist, born at Righton, Yorkshire, on March 2, 1811, was educated privately and at Oriel college, Oxford, where he studied under Kidd and Buckland. He accompanied William John Hamilton (1805–67) in 1835 through Asia Minor, the Thracian Bosporus and the Island of Zante. In 1836 Strickland brought before the Geological society several papers on the geology of these districts and on the drift deposits in Worcester and Warwick, drawing particular attention to the fluviatile deposits of Cropthorne in which remains of hippopotamus, etc., were found. With Murchison he read an important paper "On the Upper Formations of the New Red Sandstone System in Gloucestershire, Worcestershire and Warwickshire" (*Trans. Geol. Soc.,* 1840). He drew up the report (1842) of a committee appointed by the British Association to consider the rules of zoological nomenclature. He was one of the founders of the Ray society (est. 1844) for the publication of works on natural history which could not be undertaken by scientific societies or by publishers. In 1846 he settled at Oxford, and in 1850 was appointed deputy reader in geology. In 1852 he was elected F.R.S. He was killed accidentally on Sept. 14, 1853.

See Sir William Jardine, Bart., *Memoirs of H. E. Strickland* (1858); W. J. Hamilton, *Researches in Asia Minor, Pontus and Armenia* (1842).

STRIGIDAE: *see* Owl.

STRIKES AND LOCK-OUTS. A "strike" may be defined as a voluntary stoppage of work on the part of a body of workpeople, by common agreement or by order of their society or union, for the purpose of obtaining or resisting a change in the conditions of employment. The term "lock-out" came later into use to denote a stoppage of work in which, instead of the workpeople voluntarily withdrawing their labour, the employers lock their doors, as an act of industrial policy, against workpeople willing to work. In its most strict usage the term "lock-out" applies solely to cases in which employers lock-out their workpeople in order to bring to issue and settlement a state of friction which they regard as intolerable or in order to bring pressure to bear on a section who are on strike or otherwise recalcitrant—pressure calculated to constrain these latter to proceed with their work on the employers' terms.

Clear cases of "lock-out" coming within this narrow definition are not frequent in the history of industrial strife in Great Britain. Of the disputes which have occurred since the World War, those in the engineering industry in 1922, in the boilermaking

trade in 1923, in the shipyards in 1924 and in the Rossendale slipper factories in 1927 could perhaps be described as "lock-outs" without any widespread objection being raised, but if the designation "lock-out" be confined to these and kindred cases, and all other disputes be called "strikes," then the number of "lock-outs" must appear as almost negligible beside the number of strikes.

I. GREAT BRITAIN

The following table, based on the official returns collected by the Board of Trade and by the Ministry of Labour, shows the number and importance of the trade disputes in Great Britain (including Northern Ireland) that have come to the knowledge of those departments in each of the years from 1893 to 1928:—

Year	Number of disputes *beginning* in year	Number of workpeople* involved in disputes *beginning* in year	Aggregate duration in working days of *all* disputes *in progress* during year
1893	599	634,000	30,440,000
1894	903	322,000	9,510,000
1895	728	259,000	5,700,000
1896	906	192,000	3,560,000
1897	848	229,000	10,330,000
1898	695	252,000	15,260,000
1899	710	179,000	2,500,000
1900	633	185,000	3,090,000
1901	631	179,000	4,130,000
1902	432	255,000	3,440,000
1903	380	116,000	2,320,000
1904	346	87,000	1,460,000
1905	349	92,000	2,370,000
1906	479	218,000	3,020,000
1907	585	146,000	2,150,000
1908	389	293,000	10,790,000
1909	422	297,000	2,690,000
1910	521	514,000	9,870,000
1911	872	952,000	10,160,000
1912	834	1,462,000	40,890,000
1913	1,459	664,000	9,800,000
1914	972	447,000	9,880,000
1915	672	448,000	2,950,000
1916	532	276,000	2,450,000
1917	730	872,000	5,650,000
1918	1,165	1,116,000	5,880,000
1919	1,352	2,591,000	34,970,000
1920	1,607	1,932,000	26,570,000
1921	763	1,801,000	85,870,000
1922	576	552,000	19,850,000
1923	628	405,000	10,670,000
1924	710	613,000	8,420,000
1925	603	441,000	7,950,000
1926	323	2,734,000	162,230,000
1927	308	108,000	1,170,000
1928	302	124,000	1,390,000

*Workpeople involved in more than one dispute during the year are counted more than once in the totals for the year. The extent of such duplication is not very considerable, except in the case of industries involved in the general strike in May, 1926, and in the coal-mining group, in which about 106,000 workpeople in 1912, 150,000 in 1919, 300,000 in 1920, 100,000 in 1921, and 41,000 in 1926 were involved in more than one dispute.

Fluctuations in Frequency of Disputes.—The most noticeable feature of the table is the immense variation in the figures as between one year and another.

These variations, however, are due mainly—as regards numbers involved and aggregate duration, almost entirely—to the occurrence in some years of quite a small number of great disputes. The year 1926 was an extreme instance of this. The great coal mining dispute of May–December in that year accounted, at the start, for about 1,050,000 workpeople, and for an aggregate duration of over 145 million days; while the general strike early in May accounted for 1,580,000 workpeople (the largest number ever involved in any one stoppage in Great Britain), and for 15 million working days. Apart from these two disputes, the year 1926 was exceptionally free from industrial disturbance, the remaining disputes numbering only 321, with 121,000 workpeople involved, and an aggregate duration of 2,030,000 days—numbers comparable with those for such exceptionally quiet years as 1903–5 and 1927.

Duration of Disputes.—The great majority of industrial disputes are of short duration, and involve relatively small numbers of men. On the average of the years 1910–25, nearly 46% of the disputes lasted less than a week, and more than 66% under a fortnight; while less than 14% lasted six weeks or over. In the same period 48% of the disputes involved under 100 workpeople, and nearly 68% under 250; while less than 11% involved as many as 1,000.

It often happens that disputes involving large numbers are also protracted. Thus, 82% of the total loss of time through disputes in the same period of years arose from the disputes—*less than 2% of the total number*—involving 5,000 workpeople and upwards. This is no doubt partly because a dispute can rarely or never be carried on for a long time unless, on the workpeople's side, it is supported by a powerful union. Conversely, a powerful union rarely or never engages in a dispute unless (i) the subject matter of dispute is a substantial one, and (ii.) all ordinary measures of settlement have already been exhausted without success, which commonly implies that both parties are at once strong and determined.

The amount of time lost owing to industrial disputes varies enormously, not only from year to year, but also as between the different trades. Strikes and lock-outs are rare in agriculture, in the iron and steel trades, in the boot and shoe trade, and in the chemical industry. On the other hand, the coal mining industry and the engineering and shipbuilding trades have been much harassed by trade disputes, most of them short and involving relatively small numbers, but including also the five greatest disputes (measured by aggregate duration) which the country has ever experienced. These (which were all in the coal mining industry) were the prolonged stoppage of 1893, when nearly 300,000 workpeople in Yorkshire, Lancashire, and the Midlands were out from early in July to the middle of November; the stoppage of 1912, when the whole coal mining industry of the country was brought to a standstill by the demand of the Miners' Federation for the payment of an individual district minimum wage for all underground workers; and the three stoppages of 1920, 1921 and 1926, also on a national scale These five disputes resulted in the loss of 21 million, 31 million, 16 million, 72 million, and 145 million working days, respectively; a total of 285 million days, or almost exactly the same as the time lost *in the whole of the remaining disputes (numbering nearly 25,000) of the entire period of 35 years covered by the table.* The largest amounts of working days lost outside the coal mining industry have been the 15 million working days lost in the general strike of 1926, and the 13 millions lost in the great engineering dispute of 1922. Industries occupying an intermediate position as regards frequency and extent of industrial disputes are the building trades (where disputes, though rather numerous, have usually been small and local), and the textile trades.

Causes of Disputes.—The causes of disputes are of course very varied, embracing all the matters relating to conditions of employment on which differences may arise between employers and employed. Experience shows, however, that the great bulk of disputes relate to questions of wages, a much smaller proportion to hours of labour, and the balance to a large number of miscellaneous questions, such as the employment of persons or classes obnoxious to the strikers on the ground that they do not belong to their union, or have worked against its interests, or because they are held to have no "right" to the particular occupation on which they are employed, either on account of not having gone through the recognized training or of belonging to another trade. Among this class of strikes are to be included the so-called "demarcation" disputes between two bodies of workmen as to the limits of their trades, which frequently cause suspension of work by both groups, to the great inconvenience of the employer. Strikes are also not uncommon on the question of trade unionism pure and simple—*i.e.*, to obtain or defend freedom to belong to a union, or to act through its agency in negotiations with employers.

This question enters more or less as a factor into a large number of disputes, most usually, however, as a secondary cause or object, so that it does not appear prominently in the tabulation of causes in the official statistics, which is based on principal causes only. Thus the formulated demands of the strikers are usually for improved conditions of work, the question of "recognition" of the trade union only arising incidentally when the parties attempt to negotiate as to these demands. The following table shows the percentages of workpeople *directly* involved in disputes, involving stoppages of work, respecting the undermentioned causes or objects, in 1918–27 in Great Britain and Northern Ireland.

Table Showing Causes of Disputes Involving Stoppages of Work

Year	Wage increases	Wage decreases	Other wage questions	All wage questions	Hours of labour	Employment of particular classes or persons	Other working arrangements, rules, and discipline	Trade unionism	Miscellaneous questions	Total
1918 . .	41·2	3·5	4·3	49·0	17·5	16·7	3·1	11·7	2·0	100·0
1919 . .	43·8	22·6	3·7	70·1	19·2	5·4	2·5	1·1	1·7	100·0
1920 . .	76·0	2·5	3·0	81·5	0·7	9·9	2·5	1·6	3·8	100·0
1921 . .	0·5	94·9	0·9	96·3	0·6	1·3	0·8	0·4	0·6	100·0
1922 . .	0·9	33·0	6·3	40·2	1·3	4·5	51·3	2·0	0·7	100·0
1923 . .	3·1	27·4	12·4	42·9	1·8	6·9	12·4	30·7	5·3	100·0
1924 . .	54·6	14·2	6·8	75·6	0·4	6·2	4·7	3·3	9·8	100·0
1925 . .	9·7	54·2	4·7	68·6	2·2	14·2	5·6	7·7	1·7	100·0
1926 . .	0·3	38·8	0·8	39·9	0·0	0·6	0·3	0·5	58·7	100·0
1927 . .	5·2	20·3	8·9	34·4	14·6	32·5	5·8	6·7	6·0	100·0

Questions of hours of labour, quite insignificant in most years, rise occasionally to importance as in 1916–19 when the great change over to the 47–48 hour week took place, and in 1927 when modifications of those hours were in question.

Results of Disputes.—Statistics may have a fictitious element of unknown amount in that one or both sides to a negotiation may ask for more than they expect to get. A trade union, scenting a demand for a reduction in wages, may put in, as a first tactical move, an application for an increase. If, after a few days' strike, the men were to forego the application and return to work on the old terms the settlement would be apparently a defeat but actually a victory—provided no more were heard of the threatened reduction. The statistics of settlement must be read in the light of such possibilities. They may be summarized as follows:—About 21% of the disputes of the years 1911–27, on the average, ended in favour of the workpeople; 22% ended in favour of the employers; and 57% were compromised. The variations from year to year were not very great, if number of disputes only be considered; but, if the number of workpeople involved be considered, the variations are greater, owing to the preponderating influence of a few large disputes in many years. Thus, the percentage of workpeople directly involved in disputes which ended in favour of the workpeople was 21, on the average; but the annual percentage varied from 1·5 in 1921 to 74·5 in 1912, in both cases owing to disputes on a national scale in the coal mining industry.

The following table gives the percentages of workpeople directly involved in disputes involving stoppages of work, with the results, for Great Britain and North Ireland, 1918–27:—

Table Showing Results of Settlement

Year	In favour of workpeople	In favour of employers	Compromised	Total
1918 . .	23·4	22·1	54·5	100·0
1919 . .	14·0	23·9	62·1	100·0
1920 . .	10·6	10·6	78·8	100·0
1921 . .	1·5	5·6	92·9	100·0
1922 . .	4·4	12·5	83·1	100·0
1923 . .	24·8	23·1	52·1	100·0
1924 . .	9·7	18·0	72·3	100·0
1925 . .	53·1	16·1	30·8	100·0
1926 . .	1·8	94·7	3·5	100·0
1927 . .	28·1	30·6	41·3	100·0

It is, of course, to be understood that the figures in the above table only relate to the *immediate* results, as determined by the relative extent to which one or other of the parties succeed in enforcing their demands. The question of the ultimate effect of the stoppages on the welfare of the parties or of the community generally is an entirely different problem.

Methods of Settlement.—The great majority of disputes—involving 57% of the workpeople on the average of the years 1911–27—were settled by direct negotiation between the parties or their representatives; 18% by conciliation; 8% by arbitration; 5% by return to work on the employers' terms without negotiation; less than 1% by replacement of workpeople; and 11% by other methods. Here, again, the variations from year to year were generally small if the number of disputes only be considered, but very wide if the number of workpeople involved be taken into account. Thus, the number of workpeople involved in disputes that were settled by conciliation or arbitration varied from 1·2% to 68·5%; and the number involved in disputes settled by "other" methods from 0·0% to 69·0 per cent. This was a very exceptional case, in 1912, the great coal mining dispute of that year having been settled by legislation.

Table Showing Methods of Settlement

Year	Direct negotiation between the parties or their representatives	Conciliation	Arbitration	Return to work on employers' terms without negotiation	Replacement of workpeople	Closing of works	Other methods	Total
1918	47·1	18·6	16·8	6·7	0·1	0·0	10·7	100·0
1919	70·5	2·6	6·1	11·2	0·1	0·0	9·5	100·0
1920	89·6	5·0	1·9	3·2	0·2	0·0	0·1	100·0
1921	97·1	0·8	0·4	1·6	0·1	0·0	0·0	100·0
1922	93·1	1·8	0·1	4·6	0·2	0·0	0·2	100·0
1923	66·7	11·1	5·9	15·8	0·3	0·0	0·2	100·0
1924	56·7	33·7	3·4	5·9	0·2	0·1	0·0	100·0
1925	45·6	6·5	43·5	2·4	1·5	0·4	0·1	100·0
1926	41·4	0·2	0·0	0·4	0·0	0·0	58·0	100·0
1927	77·3	7·6	5·6	5·8	0·4	0·4	2·9	100·0

Organization of Strikes and Lock-outs.—In the great majority of cases strikes are organized and controlled by trade unions. It does not, however, follow from this that the growth of trade unionism has always fostered and encouraged strikes, there being evidence that in many trades the strengthening of organization has had the effect, not only of restraining ill-considered partial stoppages, but also of preventing more serious dislocations of industry by providing a channel for the expression of grievances and a recognised means of negotiating with employers. It is indeed generally considered that the industrial conditions most favourable to peace are when a powerful trade union is face to face with a representative employers' association, both under the guidance of strong but moderate leaders and neither feeling it beneath its dignity to treat on equal terms with the other.

Whether, however, trade unionism tends generally to encourage or to restrain strikes, the organization and policy of the great

majority of trade unions, as at present constituted, are based on the possibility of a collective withdrawal from work in the last resort. Dispute-pay is consequently the one universal form of trade-union benefit, and the strength of a trade union's strike-pay resources are among the factors which determine whether a dispute will be pressed to a stoppage and, if so, how long the stoppage, both sides proving recalcitrant, will last.

Although most strikes are controlled by trade unions, cases are comparatively rare in Great Britain in which the central committee of a trade union takes the initiative and directs its members to cease work. More usually a local strike movement is initiated by the local workmen, and the central committee is generally empowered by the rules to refuse its sanction to a strike and to close it at its discretion, but has no authority to order it. In many unions a ballot is taken of the members of the districts affected before a strike is authorized, and a two-thirds (or even greater) majority, either of members or of branches, in favour of a stoppage may be required before the sanction of the central executive is granted.

When a strike has been authorized by the executive, the conduct of it is frequently entrusted to a "strike committee," appointed *ad hoc*, one reason being that a strike of any considerable dimensions often affects members of several unions, so that the common action necessary in a conflict with employers can only be attained by a committee representing all the societies involved. The financial support of a local or sectional strike imposes but little strain on the resources of a large society, but where a considerable proportion of the members are affected it is usual for a union to replenish its funds by imposing a "levy" or special contribution on members remaining at work Financial support is often asked and secured from other unions and loans from financial institutions such as the Co-operative Wholesale Bank, have become increasingly a resort of impoverished trade unions during a prolonged and embarrassing dispute.

For an account of the legal powers of combinations of employers and of workpeople in the matter of declaring and conducting strikes and lock-outs the reader should turn to TRADE UNIONS. For an account of the voluntary machinery for the prevention and settlement of trade disputes without recourse to stoppage *see* CONCILIATION AND ARBITRATION. For machinery established by the State for similar purposes *see* COURT OF ARBITRATION.

Important British Trade Disputes.—Space will only permit of the mention of a very few of the most important disputes, and for the same reason, and also owing to the paucity of information for earlier disputes, it has been necessary to restrict reference to disputes occurring since 1888. Scanty records of strikes and lock-outs are indeed extant going back even as far as the year 1765; but in these very early years, and indeed much later, strikes were often demonstrations conducted by desperate and very imperfectly organized men in defiance of the law, and having something of the character (and often some of the personal consequences to the leaders) of a political rising. They are altogether different from the typical strike or lock-out of modern times.

Coal-mining.—In 1893 the coal owners of Yorkshire, Lancashire, and the Midlands demanded a reduction of 25% off the "standard" (equivalent to about 18% off the then current rates of wages), which the Miners' Federation refused to accept. The stoppage began on July 1 and lasted till Nov. 17, when it was settled by the intervention of the Government The men resumed work at the old rate of wages until Feb 1, 1894, after which date wages were to be regulated by a conciliation board, consisting of equal numbers of coal owners' and of miners' representatives, with an independent chairman

A stoppage of the coal mines on a national scale took place in 1912, when the Miners' Federation demanded an individual district minimum wage for all underground workers in mines. It was settled by the passing of the Coal Mines (Minimum Wage) Act, 1912, which virtually gave the men what they demanded

The coal mining stoppage of 1920 was in support of the men's demand for an advance in wages, not conditional upon output A temporary advance was given, pending the working out of a permanent scheme, and the men resumed work. Negotiations followed between the Mining Association (representing the coal owners) and the Miners' Federation, but no agreement could be reached, the owners insisting that wages should be regulated on a district, and the men that wages should be regulated on a national basis. The position was also affected by the Government's announcing their intention to decontrol the industry on March 31, 1921, five months earlier than had been expected. A fresh stoppage, which affected all the coal fields, began on April 1, 1921, and a settlement was finally reached on July 1, laying down the lines on which wages were in future to be regulated: the same principles were to be followed in all districts (and the settlement was to that extent national), but the costs and surpluses, on which wages were henceforth to depend, were to be calculated for each district separately

The agreement of 1921 was revised in 1924, in favour of the men, but a severe slump followed, and the employers gave notice to terminate the agreement as from the end of July, 1925. A stoppage was averted by the Government's granting a subvention until April 30, 1926, to give time for a full inquiry to be made into the state of the industry. A royal commission was appointed, under the chairmanship of Sir Herbert Samuel, which reported on March 6, 1926, they made various proposals for the improvement of the industry, but expressed the opinion that, as a temporary measure, an immediate reduction of wages was necessary. The owners accordingly gave notice of reductions of wages to take effect after April 30, when the subvention ceased; but these were unacceptable to the men, and the stoppage began on May 1. The dispute terminated at various dates in November and December (except in some Midland areas, where an agreement was reached earlier) by the acceptance of the men of district settlements, usually involving considerable reductions of wages and increases in hours of labour.

Engineering and Shipbuilding.—In 1897–98 there was a dispute in the engineering industry, which affected 47,500 men and lasted 29 weeks. It closely followed the formation of the Engineering Employers' Federation, and was an effort to make a stand against what the Federation regarded as encroachments on the employers' freedom of management. The employers were completely successful.

Another great dispute occurred in the engineering industry in 1922, also mainly on the question of management; only one trade union, but that much the largest—the Amalgamated Engineering Union—was concerned Modified proposals were accepted by the men after a stoppage of about three months.

Most of the strikes and lock-outs in the shipbuilding industry are relatively small, and of short duration, many of them being concerned with demarcation questions; but there were two great disputes, in 1922 and in 1923 That of 1922 affected all the trade unions in the industry, and was directed against a reduction of wages. A modified reduction was accepted after a stoppage of five and a half weeks. The dispute of 1923 was more prolonged, lasting nearly seven months, but it affected only the members of one trade union: this was, however, the principal trade union in the industry, the United Society of Boilermakers and Iron and Steel Shipbuilders. The dispute was occasioned by the refusal of the union to accept an agreement relating to overtime and night-shifting working, which had been signed by the other shipbuilding trade unions. The dispute was eventually compromised, the employers agreeing to discuss with the union the modification of the agreement in certain points.

Other Trades.—Few of the disputes in the remaining trades have approached those mentioned above in magnitude; but the following are, for various reasons, of special interest, and may be briefly mentioned:—

1889. A strike of dock and waterside labourers in London for a rise in time rates of wages from 5d to 6d an hour, the abolition of contract and piecework, and the remedy of other grievances lasted for a month, and resulted in the almost complete victory of the men, largely owing to the support of the public. The strike was carried on by the newly formed Dock Labourers' Union, and was memorable as a demonstration that unskilled labourers could be successfully organized

1892–93. A dispute in the cotton spinning trade in the Oldham and surrounding districts against a proposed reduction in wages of 5% involved 50,000 workpeople and lasted for twenty weeks. It was terminated by the famous "Brooklands agreement," which provided for a reduction of about 3%, and also contained rules for the settlement of future disputes by conciliation methods.

1895. The last considerable dispute in the boot and shoe industry occurred in this year. At the end of the dispute a series of conciliation and arbitration boards were set up, which have successfully settled all disputes in the industry for more than 30 years, with a few insignificant exceptions.

1911–12. A series of disputes, more or less inter-connected, occurred in the transport trades in this year, seamen, dock and other transport workers, and railway men being affected. There was also a strike, followed by a lock-out, in the cotton weaving industry in Lancashire in these years, which were, indeed, full of industrial disturbance.

1919. There was a three-weeks' strike in the cotton trade of Lancashire and the adjoining counties, both the spinning and the weaving branches being affected. The operatives obtained the advance (of 30% on list prices) which they had asked for, and a reduction in the working hours from 55½ a week to 48 (instead of 46½ as asked).

1921. The cotton operatives resisted a severe reduction in list piece rates; a modified reduction was eventually accepted.

1926. The so-called general strike of this year was called by the general council of the Trades Union congress in support of the coal miners; it was terminated at the end of nine days. The men called out included railway and transport workers, the printing and paper trade unions, some branches of the metal and engineering and of the building trade workers, and some other classes; and it was intimated that other classes of workers would be called out later, if necessary. This has been the only instance so far in Great Britain of a general strike; though there had been a strike of the kind in Dublin in 1913, involving about 20,000 workpeople. One of the principal objects of the Trade Disputes and Trade Unions Act, 1927, was to prevent the recurrence of a general strike; though the Act also limits the right of picketing, forbids civil servants to belong to trade unions having political objects, and requires members of trade unions who desire to support the political funds of their unions to "contract in," instead (as previously) of requiring those who objected to contributing to those funds to "contract out," *i.e.*, apply for exemption.

II. OTHER EUROPEAN COUNTRIES

France.—The average number of industrial disputes in the seven years 1900–06 was 812, with a minimum of 512 and a maximum of 1,314; the average number of workpeople directly involved in these years was 222,800 (minimum, 111,400; maximum, 439,300); and the average aggregate duration in working days, 4,130,000 (minimum, 1,862,000; maximum, 9,445,000).

There was a great increase in 1919 and 1920, years of great industrial disturbance in many countries; and a return in later years to more normal figures, as will be seen from the following table:—

Year	Number of disputes	Number of workpeople directly affected	Aggregate duration in working days
1919 . . .	2,053	1,206,000	16,129,000
1920* . . .	1,924	1,488,000	24,564,000
1921 . . .	576	454,000	8,092,000
1922 . . .	711	307,000	3,386,000
1923† . . .	1,112	366,000	5,292,000
1924† . . .	1,083	275,000	3,863,000

*For the years 1920–24 particulars for Alsace-Lorraine are included.
†Figures relate to strikes only.

A national strike of railway employees on all the French railways in 1910 was brought to an end in little more than a week by the issue of mobilization orders to all the reservists on the railways. In recent years a noticeable feature of the strike statistics in France has been a tendency to strike among employees of public bodies.

Germany.—During the seven years 1901–07 the average number of industrial disputes recorded in Germany was 2,061 (minimum, 1,091; maximum 3,626); and the average number of workpeople directly and indirectly affected 230,700 (minimum, 68,000; maximum 543,000). Statistics of aggregate duration are not available for these years.

The following table gives particulars of the numbers of disputes, numbers of workpeople affected (including agricultural and non-manual workers), and aggregate duration of disputes in Germany in the years 1919–26. Stoppages due to political motives (*e.g.*, the Kapp putsch, and the occupation of the Ruhr) are excluded.

Year	Number of disputes	Number of workpeople directly affected	Aggregate duration in working days
1919 . . .	4,068	2,144,000	35,132,000
1920 . . .	4,392	1,562,000	17,703,000
1921 . . .	4,788	1,540,000	26,316,000
1922 . . .	5,201	1,969,000	28,894,000
1923 . . .	2,162	1,779,000	14,584,000
1924 . . .	2,012	1,634,000	36,360,000
1925 . . .	1,766	758,000	17,114,000
1926 . . .	365	91,000	1,405,000

It may be mentioned, that there have been several instances of general strikes, elsewhere almost unknown, in the three Scandinavian countries (Norway, Sweden, and Denmark).

III. BRITISH DOMINIONS

Australia and New Zealand.—These dominions have endeavoured in various ways, and for a long series of years, to prevent strikes and lock-outs by direct legislative action and by the provision of wages boards and other devices for the settlement of threatened disputes. These measures, however, have by no means wholly put a stop to disputes in Australia, as will be seen from the table below.

The following table shows the numbers of disputes, numbers of workpeople involved, and aggregate duration in working days in Australia in each of the years 1919 to 1926. As in many other countries, the years 1919–21 were years of great industrial disturbance; the year 1919 alone accounted for over six million working days lost.

Year	Number of disputes	Number of workpeople affected	Aggregate duration in working days
1919 . . .	460	158,000	6,308,000
1920 . . .	554	156,000	1,872,000
1921 . . .	624	165,000	957,000
1922 . . .	445	116,000	859,000
1923 . . .	274	76,000	1,146,000
1924 . . .	504	152,000	919,000
1925 . . .	499	177,000	1,129,000
1926 . . .	360	113,000	1,310,000

Canada.—Under the Lemieux Act (the Industrial Disputes Investigation Act, 1907) strikes and lock-outs are unlawful, under heavy penalties, in public utility industries (railways, coal mines, etc.) before or during a reference of the dispute to a board of conciliation.

The following table shows the number of disputes, number of workpeople involved, and aggregate duration in Canada during the years 1919 to 1926:—

Year	Number of disputes	Number of workpeople affected	Aggregate duration in working days
1919 . . .	298	134,000	3,942,000
1920 . . .	285	52,000	887,000
1921 . . .	145	23,000	956,000
1922 . . .	85	41,000	1,975,000
1923 . . .	91	33,000	768,000
1924 . . .	73	32,000	1,770,000
1925 . . .	83	26,000	1,744,000
1926 . . .	77	24,000	297,000

It will be seen that, as in many other countries, the figures for 1919 are much higher than those for the other years of the period.

(J. H)

THE UNITED STATES

The first strike in American history took place in 1786 when the journeymen printers of Philadelphia quit work to enforce their demand for a minimum wage of $6 a week. There are records of industrial disturbances before this time but the parties involved in these early disputes were masters and the authorities of some of the colonial towns The disputes arose over price fixing activities of the municipal authorities There are no records of labour disputes in the modern sense of the term prior to 1786 due to the fact that a distinct cleavage between the interests of the labouring man and the employer is an essential characteristic of a labour dispute, and until the latter part of the 18th century the functions of employer and labourer were ordinarily undifferentiated. With the expansion of markets during the 18th century and the accompanying growth of distinct classes of labourers and employers, the strike became the customary means by which workers safeguarded their standard of living against encroachments of employers

Prior to 1827 there was no labour movement in America and the few industrial disputes of which there is record were conducted on a small scale and with little or no organization. Rising prices in the '20s brought on a number of strikes, principally to secure higher wages but also in a few instances for the ten-hour day. From 1827 to 1832, politics occupied the attention of labour and there were few strikes, but after 1832 the political movement suffered an eclipse and strikes became more numerous as interest in organized labour revived From 1833 to 1837 there were 173 strikes, but the panic of 1837 put an end to organized labour and there followed a long period of depression during which there were few strikes.

After the Civil War unionism revived, and following the trend of the times, took on a national character. Industrial disputes likewise began to take place on a nation-wide scale in contrast to the local outbursts of isolated unions that were the characteristic labour disputes of the period before the Civil War The first great industrial dispute of nation-wide importance occurred in 1877 during a period of intense business depression. The workers on the Pennsylvania and the Baltimore and Ohio railroads struck in protest against a wage reduction, and although the men were unorganized, the strike spread like wildfire over the roads Several lives were lost and millions of dollars worth of property was destroyed before the strike came to an unsuccessful conclusion for the workers

An important strike occurred in 1885 when the shop employees on the Gould railways struck. The Knights of Labor, to which the strikers belonged, brought the strike to a successful close, thus gaining great prestige in the American labour movement. In 1886, however, the Knights were unsuccessful in another strike on the Gould roads This year was outstanding for an epidemic of strikes and lockouts on the issue of the eight-hour day, most of which were unsuccessfully conducted by the Knights of Labor. In connection with these eight-hour strikes a tragic occurrence took place in Chicago A meeting was held to protest against police activities in the strike and was addressed by anarchists who were advocates of violence. A bomb, thrown in the course of the meeting, killed 15 policemen Public sentiment throughout the country was alienated from the strikers in their struggle for the eight-hour day although there was no connection between the anarchists and the union organizations The widespread failure of the Knights to win in the disputes of 1886 was a major factor in the decline of this organization The American Federation of Labor came to the front with the decline of the Knights of Labor and its policy of organizing the skilled workers on craft lines has been reflected in the nature of industrial disputes since that time There have been no attempts at general strikes under the leadership of the American Federation of Labor.

After 1887 there was a lull in industrial conflict which was broken in 1890 by a movement for the eight-hour day sponsored by the American Federation of Labor The carpenters were chosen to make the first attack for the shorter day and their strikes throughout the country in May, 1890, met with a large degree of success for their organization.

The panic of 1893 brought on numerous labour disturbances and it is estimated that in 1894 as many as 750,000 workers were involved. The most important strikes of this period were the miners' strike and the Pullman strike both of which came in 1894 About 125,000 miners struck against wage reductions and held out for three months before going back to work without securing their demands.

The Pullman strike was one of the most interesting episodes in American labour history The American Railway Union, of which Eugene V. Debs was the founder, declared a sympathetic strike on June 26, 1894, in support of the employees of the Pullman Company, and refused to handle Pullman cars A great deal of violence and destruction of property took place in Chicago and Federal troops were sent there against the protest of the governor of Illinois It was in this strike that the injunction first became an important aid to employers as a means of defeating strikes The officers of the American Railway Union were imprisoned for violating an injunction which the railroads had secured. By the middle of July the strike had practically ended in defeat for the union.

In 1897 the United Mine Workers were again involved in an extensive strike Although at this time the union membership was not over 10,000 men, at least 100,000 obeyed the strike call and the whole bituminous industry was tied up with the exception of West Virginia After a three months' strike the union won a thorough-going victory over the operators The settlement conceded the miners a 20% increase in wages, the eight-hour day, and union recognition

The strong hold that the United Mine Workers' Union has had on the so-called central competitive field dates from this victory With the revival of prosperity after 1898 a renewal of interest in trade unions occurred and the number of organized workers increased rapidly until 1905 During this period there was a large increase in the number of strikes as well as in the number of workers involved, and in general the disputes may be characterized as offensive moves on the part of workers to secure better conditions in contrast to the defensive strikes of the depressed '90s

The strike of 150,000 anthracite miners in 1902 was the most important strike of this period The miners demanded a reduction of hours, increase of wages, and recognition of the union. After five months the country faced a serious coal shortage and President Roosevelt intervened to secure a settlement. The strike ended when the workers and the employers agreed to accept arbitration by a board appointed by the President. The miners won a 10%

increase in wages, and a shorter working day but their union was not recognized. In this period the left wing of the American labour movement achieved some prominence in carrying on strikes. In 1903 and 1904 the radical Western Federation of Miners carried on an unsuccessful strike to secure the eight-hour day, and a few years later the Industrial Workers of the World were successful in their New England textile strikes, but defeats in Paterson, N.J., in 1912 and 1913 destroyed their prestige among workers as a power in industrial conflict.

Depression followed the prosperity of the turn of the century and after 1905 American labour was on the defensive until the World War period.

When the United States entered the World War in 1917 the American Federation of Labor discouraged strikes in the essential industries. A number did occur, however, and these were mediated by Government committees. When the war was over, the War Labor Adjustment boards were dissolved and workers, who had been prevented from striking by the promise of peaceful settlement, felt that the government and employers had broken faith. In Sept. 1919, the steel strike began as a result of the united action of 24 international unions. Approximately 365,000 men left their jobs, but gradually returned to work, and by Jan. 1920, the remaining 100,000 men returned and the mill owners had won a sweeping victory.

In Aug. 1919, although forbidden by the officers of the union, 250,000 railway shopmen went on strike because of the delay of the Wage Adjustment Board to reach a decision on the demands of the men for increased pay. After six days the strike was called off and the men returned to work.

In Nov. 1919, 435,000 bituminous coal miners struck for wage increases and shorter hours. In March, 1920, an agreement was reached providing for a 27% increase in wages. In Sept., 1919, 93% of the Boston policemen struck for the right to organize and to affiliate with the American Federation of Labor. Their places were filled with other men.

After the break in the prosperity of the post-war period there were general wage reductions which resulted in numerous defensive strikes. The most important strikes of this period were the coal strike and the Railroad Shopmen's strike of 1922. The coal strike affected both bituminous and anthracite industries, and involved 600,000 workers. The outcome of the strike was a success for the workers.

On July 1, 1922, a strike of 500,000 railway shopmen began. The unions involved had refused to accept a decision of the Railroad Labor Board reducing wages, which together with certain grievances against the railroads, was the cause of the strike. In September a sweeping injunction was obtained by Attorney General Daugherty which hindered materially the activities of the strikers. The strike gradually ended later in the year with both sides claiming a victory.

In 1923 a very marked decline in the extent of industrial disputes set in throughout the country. This decline may be accounted for in a large measure by the high level of real wages prevailing in the United States since 1923 because of falling prices and a generally stable level of wages.

The anthracite coal region has been the scene of two large strikes in recent years. In 1923 after a strike of three weeks the workers secured a 10% wage increase, and in 1925 after striking for 170 days the workers and operators agreed to continue their old trade agreement.

In 1926 one of the principal disputes occurred in Passaic, N.J., when the textile workers carried on a strike which ended after a year with gains for the workers. Some 40,000 cloak and suit workers in New York City struck in July, 1926, and remained out until later in the year when an agreement was reached with the employers.

One of the most extensive strikes in recent years took place when 200,000 bituminous coal miners struck on April 1, 1927, because of the employers' failure to renew the agreement that had been in force for several years. The union refused to negotiate with the employers except on a national basis but in 1928 this stand was abandoned and the union negotiated with the employers by districts, taking in some cases a wage cut. The bituminous coal industry is one of the least prosperous of American industries due to over-expansion and excessive competition, and probably will continue to be the source of bitter labour disputes unless it undergoes an extensive re-organization.

With the exception of the coal strike which continued into 1928 there were no important nation-wide strikes in 1927 and 1928. There were, however, several large strikes in various cities. In 1927 6,000 teamsters struck in New York City and secured a wage increase. The plumbers in Brooklyn carried on a strike for two months and returned to work under an agreement to arbitrate the question of a wage raise.

In July, 1927, the building trades workers of Baltimore were involved in an important jurisdictional dispute. Late in Aug. 1927, 350 theatres closed in Chicago because of a dispute with the moving picture machine operators' union. An unusual strike occurred in Aug. 1927, in Henderson, N.C., when 800 unorganized textile workers struck to enforce wage demands.

The year 1928 saw a continuation of the same general industrial situation that had existed for the previous five years and the industrial disputes of 1928 reflected the condition of the country.

Generally speaking in 1928 unions were on the aggressive for wage increases and shorter hours, although there were important exceptions to this general rule. The mine-workers due to the condition of the industry were on the defensive, and the strike of 25,000 textile workers in New Bedford, Mass., ended in a 5% wage cut for the workers.

STATISTICS OF INDUSTRIAL DISPUTES IN THE UNITED STATES

The following table was prepared from material appearing in the publications of the United States Department of Labor. No statistics for the period 1905–16 were published. The figures for the number of employees involved in disputes from 1916 to 1928 represent only the employees involved in the portion of the industrial disputes from 1916 to 1928 reported by the Bureau of Labor Statistics with the consequence that the actual number of employees involved during this period was considerably larger than the number given in the table. Since 1916 no distinction has been made between strikes and lock-outs, these being combined under the general heading of industrial disputes. In this article the same procedure has been followed.

Number of Industrial Disputes in the United States and the Number of Employees Involved (1881–1928)

Year	Number of industrial disputes	Number of employees involved
1881	477	101,725
1890	1,897	305,133
1895	1,255	298,496
1900	1,839	446,218
1901	3,012	412,537
1902	3,240	583,447
1903	3,648	644,014
1904	2,419	420,662
1905	2,186	244,811
1916	3,789	1,599,917
1917	4,450	1,227,254
1918	3,353	1,230,080
1919	3,630	4,160,348
1920	3,411	1,463,054
1921	2,385	1,099,247
1922	1,112	1,608,321
1923	1,553	744,048
1924	1,249	654,453
1925	1,301	428,416
1926	1,035	329,592
1927	734	349,434
1928	576	342,341

Principal Causes and Results of Industrial Disputes.—The following tables were prepared from material published in the July 1928, *Monthly Labor Review*, p. 87, and show the principal causes and results of industrial disputes in the United States by years from 1916 to 1927:

Principal Causes of Disputes Beginning in Each Year in the United States (1916–27)

Cause of dispute	Number of disputes beginning in											
	1916	1917	1918	1919	1920	1921	1922	1923	1924	1925	1926	1927
Increase of wages	1,301	1,571	1,397	1,115	1,429	120	156	445	255	277	260	142
Decrease of wages	35	36	36	86	147	896	261	49	125	117	52	57
Increase of wages and decrease of hours	481	378	256	578	269	34	16	58	30	29	39	43
Decrease of hours	113	132	79	117	62	294	22	16	18	7	19	20
Increase of hours	7	18	6	25	8	18	12	5	5	6	4	3
Recognition of union	404	333	241	522	308	191	137	153	152	109	117	119
General conditions	68	116	93	123	116	83	72	80	79	89	66	47
Discharge of employees	144	246	192	163	170	45	44	79	54	74	61	50
Sympathy	33	71	35	108	67	36	33	31	22	39	29	23
Jurisdictions	19	21	16	16	20	10	10	13	23	59	17	13

Results of Disputes Ending in Each Year in the United States (1916–27)

Result	Number of disputes ending in											
	1916	1917	1918	1919	1920	1921	1922	1923	1924	1925	1926	1927
In favor of employers	748	395	465	687	677	701	248	368	283	253	226	169
In favor of employees	749	631	627	627	472	256	259	403	354	349	288	235
Compromise	777	720	691	797	448	291	105	168	138	138	147	129
Employees returned pending arbitration	73	137	204	50	61	80	16	46	45	51	36	29
Not reported	101	191	211	59	214	198	113	160	139	198	83	77

For further statistics on industrial disputes in the United States from 1881 to 1905 *see* the *21st Annual Report* of the Commission of Labor (1906). A convenient summary of this material will be found in Groat, *Organized Labor in America*, chapter x. For further statistics on disputes since 1916 *see* the *Monthly Labor Review*. For a thorough discussion of industrial disputes in the U S down to 1898 see *History of Labour in the United States* by Commons and Associates For the period since 1898 see *History of Trade Unionism in the United States* by Perlman.

(J. R. Co.)

STRINDBERG, JOHAN AUGUST (1849–1912), Swedish dramatist, novelist and poet, born in Stockholm Jan. 22, 1849, grew up under poverty-stricken and unhappy conditions, and after a short period at Uppsala university, became a school teacher; then a wealthy doctor interested himself in him and undertook to complete his education in medicine. Strindberg first found his feet as a dramatist He wrote *Hermione* (1869), an ambitious tragedy in verse; and a one-act piece, *In Rom* (1870) was performed For a year or two he struggled as a journalist in Stockholm, until in 1874 he was appointed librarian in the Royal Library In these years he completed his first great play, *Master Olof* (*Master Olof*, 1874), with the Swedish reformer Olaus Petri, as its central figure, and *Röda Rummet* (*The Red Room*, 1879), a satiric novel suggested by *The Pickwick Papers.* Strindberg then wrote the dramas *Gillets hemlighet* (*The Secret of the Guild*, 1880), *Lycko-Pers resa* (*Lucky Peter's Travels*, 1880), and *Herr Bengts hustru* (*Sir Bengt's Wife*, 1882). In 1882–83 followed the splendid stories of *Svenska oden och äventyr* (*Swedish Fates and Adventures*), which established his fame. In 1875 he met Siri (Sigrid) Wrangel, the wife of an officer, and became entangled in a fateful passion, which after her divorce in 1877, ended in marriage After a year or two, his love turned to suspicious hatred and the first signs showed themselves of persecution mania. He had described his early life in the autobiography, *Tjänstekvinnans son* (*The Son of a Bondswoman*, 1886); and his unhappy marriage is the theme of the revolting and self-lacerating *En dåres försvarstal* (*A Fool's Defence*, 1893) His relations to Siri Wrangel colour all his imaginative work in this period. In the early 'eighties he lived for a time in Paris, and Switzerland, where his literary activity ranged from lyric poetry and satire to studies of the French peasant, and the masterly novels of *Utopier i verkligheten* (*Realised Utopias*, 1885) With the stories and sketches of *Giftas* (*Married*, 1884–86) he launched an attack on marriage which involved him in a prosecution, resulting, however, in acquittal. The plays *Fadren* (*The Father*, 1887) and *Fröken Julie* (*Lady Julia*, 1888) open a new phase in Strindberg's dramatic work, and form a landmark of importance in the history of European realism Similar plays followed, most of which turn round the author's own marital tragedy But in those years he also wrote his greatest contributions to Swedish fiction, the masterly novels *Hemsoborna* (*The People of Hemso*, 1887), and *I Havsbandet* (*In the Outer Skerries*, 1890). A very dark period followed His marriage was dissolved in 1891; his misery was accentuated by money difficulties, and for a time he hovered on the brink of insanity. A second marriage with an Austrian lady, Frida Uhl was even more disastrous than the first.

The dark experiences of these terrible years found their precipitate in *Inferno* (1897), *Legender* (1898), and the great allegorical drama in three parts, *Till Damascus* (*To Damascus*, (1898, 1904); to this period belong, too, *Advent* (1899) and the effective play *Brott och brott* (*Crimes and Crimes*, 1899) When reconvalescence set in, Strindberg returned to the historical drama and now produced a long series of works of power and originality, the finest being perhaps *Gustav Vasa* (1899) and *Gustav Adolf* (1900), he also wrote a number of symbolic poetic plays, notably *Ett Drömspel* (*A Dream Play*, 1902). In 1901 appeared the engaging drama *Påsk* (*Easter*) and the masterly realistic tragedy *Dodsdansen* (*The Dance of Death*), the greatest of his harrowing marriage dramas. For the *théâtre intime* which he established in Stockholm, he also wrote many short pieces, prominent among them *Spoksonaten* (*The Ghost Sonata*, 1907). Of the prose works of his last period may be mentioned *Fagervik och Skamsund* (*Fairhaven and Foulsound*, 1902) and *Taklagsöl* (*The Festival of the Finished House*, 1906), which affords a glimpse into Strindberg's third marriage with the actress Harriet Bosse. In 1903 appeared the last volume of his autobiographical writings, *Ensam* (*Alone*), a book of tragic pathos; and in 1907–08 what is perhaps the most significant work of his last period, *En blåbok* (*A Blue Book*), of which further volumes were published after his death Strindberg died in Stockholm on May 14, 1912. He is Sweden's greatest modern writer, and has exerted a deep and lasting influence on the European novel and drama

Bibliography.—The standard edition of Strindberg's *Samlade Skrifter* is that edited by J Landquist, 55 vols. (Stockholm, 1912–21). Most of his works have been translated into English and there is a complete German edition by E. Schering; the chief works have, of course, appeared also in French The Anglo-Swedish Foundation has begun (1929) the publication of a new translation of his dramas The chief biographies are by N. Erdmann, Stockholm, 1920, and E. Hedén, Stockholm, 1921; there is an English life by Miss L. Lind of Hageby, London, 1913 The specialist literature on Strindberg in Swedish, English, French and German is already large. Here may be mentioned as the most important of recent books, Martin Lamm, *Strindbergs dramer*, 2 vols, Stockholm, 1924–26.

STRINGED MUSICAL INSTRUMENTS may be divided into five different classes, according to the method whereby the strings are set in vibration.

1. Strings Plucked by Fingers or Plectrum.—Twanging the strings by the fingers is the most primitive method, probably

suggested by the feeble note given out by the tense string of the hunter's bow. The *nanga* of the ancient Egyptians, of which specimens are preserved in the British Museum, is the only link as yet discovered between the bow and the harp.

The next step observed is the device of stretching the strings partly over a soundboard and partly *à vide*, as in the cithara, the lyre, the rotta, the crwth, etc. In this stage the strings were made to bridge an open space for greater convenience in twanging them with both hands. The gradual closing up of this open space marked the steps in the transition from cithara to fiddle.

When the principle of stopping strings by pressing them against a fingerboard in order to obtain several sounds from each had been discovered and applied by adding a neck to the body, a new subdivision was created in this class of instruments. This principle involved a very great advance in technique, and produced the two great families of guitar and lute. The addition of a keyboard to the psaltery, created another new class of instruments, of which the principal members were the clavicymbalum, the virginal, spinet and the harpsichord.

2. Strings Struck by Hammers or Tangents.—The earliest known instrument thus played was the Assyrian dulcimer, or *pisantir*. In this, as in the psaltery, the strings were stretched over a rectangular or trapezoid sound-chest and were struck by sticks or hammers. The dulcimer has survived in the *cembalo* or *cimbalom* of the Hungarian gipsies. The addition of a keyboard produced the clavichord, and later the pianoforte.

3. Strings Set in Vibration by Friction of a Bow.—Although used with various other instruments, such as the Oriental rebab and its European successor the rebec, with the oval vielle, the guitar or troubadour-fiddle and the viols, it is with the effect of the bow on the perfected type represented by the violin family that we are mostly concerned. The strings in this case are all of the same length, difference in pitch being secured by thickness and tension. The fingers, by pressing the strings, produce a variety of notes from each string at will by shortening the vibrating section as the position of the fingers shift in the direction of the bridge. To this class belong also the Welsh crwth and the tromba marina.

4. Strings Set in Vibration by Friction of a Wheel.—This class is small, being represented mainly by the organistrum, and the hurdy-gurdy and a few sostenente keyboard instruments. In these instruments the rosined wheel performs mechanically the function of the bow, setting the strings in vibration as it revolves. A row of ten or 12 keys controlling wooden tangents performs the function of the fingers in stopping the strings.

5. Strings Set in Vibration by the Wind.—An example is the aeolian harp. Here the eight strings of different thickness, but tuned strictly in unison and left slack, are set in vibration by a current of air passing obliquely across them causing the strings to divide into aliquot parts, thus producing various harmonics.

In regard to the structural features of stringed instruments the construction of the sound-chest divides those played by hand into two distinct classes, viz., those with the box-form type, consisting of back and belly (or sound board), joined by ribs of equal width, and those with a vaulted back to which is attached directly a flat sound board, without the intervention of ribs.

STRIPE (Chevron—"A charge or device consisting of a bar bent like two meeting rafters."—Heraldry).

(1) **Rank Stripes.**—In the fighting services of practically every country the rank of non-commissioned officers is indicated by the wearing of a certain number of chevrons on the tunic.

In July 1802 a General Order was issued stating that in future British non-commissioned officers would wear as an indication of rank, instead of epaulets and shoulder knots, the following chevrons on their right arms, viz.:—Serjeant-Majors and Quartermaster-Serjeants 4 bars; all other Serjeants 3 bars; Corporals 2 bars. In 1862 a crown over the 3 bar chevron was introduced to distinguish Colour-Serjeants. In 1881 the 4 bars were abolished for Serjeant-Majors and a crown substituted. When the appointment of Lance-Corporal was introduced this was indicated by 1 bar. At the present time (1929) stripes indicate the following ranks or appointments:—1 bar, Lance-Corporal; 2 bars, Corporal; 3 bars, Lance-Serjeant and Serjeant. In the Foot Guards Lance-Corporals wear 2 bars. Although stripes were originally worn on the right arm only they were later worn on both arms for a time in full-dress, but at present they are worn only on the right arm. In service dress they are worn on both arms above the elbow. Rank chevrons are **V** shaped.

Rank chevrons are worn in the following armies as indicated:—

United States Army. Master Serjeant	3, and an arc of 3 bars.
Technical Serjeant	3, „ „ „ „ 2 „
First Serjeant	3, „ „ „ „ 2 „ with a lozenge in the centre.
Staff Serjeant	3, and an arc of 1 bar.
Serjeant	3
Corporal	2
Private, first class	1

The chevrons are made of olive drab material on a dark blue ground.

French Army. Serjeant-Major	2 together in silver below the elbow.
Quartermaster-Serjeant	2, one above and one below the elbow, in silver.
Serjeant	1 below the elbow in silver.
Quartermaster-Corporal	1 above „ „ „ „ and 2 below the elbow in red material.
Corporal	2 below the elbow in red material.
Private, first class	1 „ „ „ „ „ „ worn diagonally on the sleeve.

German Army. Obergefreiter (Senior Lance-Corporal)	3 silver chevrons.
Gefreiter (Junior Lance-Corporal)	2 „ „
Oberschütze (Senior Private) Oberreiter (Trooper) Oberkanonier, etc. (Gunner, etc.)	1 „ chevron.

Belgian Army, Λ shaped, below elbow. 1st Serjeant-Major or 1st Maréchal des logis Chief	2 thick and 2 thin.
Serjeant-Major or Maréchal des logis Chief	2 „ „ 1 „
1st Serjeant or 1st Maréchal des logis Chief	1 „ „ 1 „
Serjeant or Maréchal des logis	1 „ „ 1 „
Caporal or brigadier	2 horizontal stripes in red wool.

(2) **Good Conduct Badges** are chevrons, **Λ** shaped, worn in the British service on the left sleeve below the elbow to indicate periods of good conduct, viz.:—1 bar for two years, 2 bars for five years, 3 bars for twelve years, 4 bars for eighteen years, 5 bars for twenty-three years and 6 bars for 28 years. An additional bar is given for every 5 years' service. Good conduct badges are only worn by privates and lance corporals (and equivalent ranks).

(3) **Wound Stripes or Gold Stripes,** were introduced into the British service by Army Order 249 of 1916 as a distinction to be worn by all ranks who had been wounded at any time during the World War. The stripe was worn perpendicularly on the left sleeve below the elbow and was made of gold Russia braid, two inches in length. A stripe was worn for each occasion on which the individual was wounded, the second and subsequent stripes being half an inch from each other. The wearing of these stripes has now been discontinued in the British service. They are, however, still worn in the U.S.A. forces, where they are made of gold lace or bullion **V** shaped and are worn on the right sleeve.

(4) **War Service Chevrons.**—In the British service these were introduced by Army Order 4 of 1918 and were small worsted chevrons, **Λ** shaped, worn on the right sleeve below the elbow. A red chevron was worn by all ranks who served overseas during 1914 and a blue chevron for each complete year for those who served overseas after 1914. The wearing of these chevrons was discontinued in 1922 by Army Order 434. In the U.S.A. forces they are still worn and consist of a **V** shaped chevron worn on the left sleeve. They are made of gold lace, bullion or sky blue cloth. When worn in conjunction with "Service Stripes" they are worn above the stripes. A chevron was granted

for each six months' service in the European zone during the World War

(5) **Service Stripes.**—In the U.S.A. all enlisted men of the Regular Army, National Guard or Organised Reserves wear a stripe of olive drab material on a dark blue ground for every period of 3 years' service in the Federal Service For service in the National Guard not in Federal Service similar stripes are worn but on a buff ground. These stripes are worn diagonally on the left sleeve of the service coat. (T. J. E)

STRODE, RALPH (*fl.* 1350–1400), English schoolman, was probably a native of the West Midlands He was a fellow of Merton College, Oxford, before 1360, and famous as a teacher of logic and philosophy and a writer on educational subjects. He belonged, like Thomas Aquinas and Bonaventura, to that "School of the Middle" which mediated between realists and nominalists. Besides his *Logica,* which has not survived, he wrote *Consequentiae,* a treatise on the syllogism, and *Obligationes* or *Scholastica militia,* a series of "formal exercises in scholastic dialectics." He had some not unfriendly controversy with his colleague John Wyclif, against whom he defended the possession of wealth by the clergy, and whose doctrine of predestination he attacked. Strode is also associated with John Gower in Chaucer's dedication of *Troylus* and *Cryseyde,* and Strode himself, according to the 15th-century *Vetus catalogus* of fellows of Merton, was a "poeta nobilis." Leland and Bale confirm this testimony, and Professor I Gollancz has suggested the identification of the *Phantasma Radulphi* attributed to Strode in the *Vetus catalogus* with the beautiful 14th-century elegiac poem *The Pearl.* If this holds good, Strode wrote also *Cleanness, Patience,* and *Sir Gawayne and the Green Knight.* From 1375 to 1385 this Strode or another of the same name was common sergeant of the city of London; he died in 1387.

STRODE, WILLIAM (1598–1645), English parliamentarian, second son of Sir William Strode, of Newnham, Devonshire, was returned to parliament in 1624 for Beeralston, and represented the borough in all succeeding parliaments till his death. He from the first threw himself into opposition to Charles I and took a leading part in the scene of March 2, 1629, when the Speaker, Sir John Finch, was held down in the chair. (*See* HOLLES, DENZIL.) Prosecuted before the Star Chamber, he refused "to answer anything done in the House of Parliament but in that House " On May 7, a fresh warrant was issued, and a month later, to prevent his release on bail, he was sent by Charles with two of his fellow members to the Tower Refusing to give a bond for his good behaviour, he was sentenced to imprisonment during the king's pleasure, and was kept in confinement in various prisons for eleven years In January 1640, in accordance with the king's new policy of moderation, he was liberated; and on April 13, took his seat in the Short Parliament, with a mind embittered by the sense of his wrongs. In the Long Parliament, which met on Nov. 3, 1640, he was the first to propose the control by parliament over ministerial appointments, the militia and its own duration; supported the Grand Remonstrance of Nov 7, 1641; and displayed a violent zeal in pursuing the prosecution of Strafford He was included among the five members impeached by Charles of high treason on Jan 3, 1642 He opposed all suggestions of compromise with Charles, urged on the preparations for war, and on Oct. 23, was present at the battle of Edgehill. In the prosecution of Laud he showed the same relentless zeal as he had in that of Strafford Strode died on Nov 28, 1645.

STROMNESS, a burgh of barony, parish and seaport, in the island of Pomona, county of Orkney, Scotland. Pop. (1921), 1665. It is situated on the side of a well-sheltered bay, 14 m. by steamer W. of Kirkwall Many of the houses are within tidal limits and furnished with quays and jetties.

STRONG, EUGENIE (*née* SELLERS), English archaeologist, married in 1897 the late S A. Strong, librarian to the House of Lords. She was educated in France and at Girton college, Cambridge, of which she became the first fellow in 1910. She lectured on Greek art and archaeology in London, Rome and Dublin, and in 1913 delivered the Norton lectures for the Archaeological Institute of America. In 1904 she became librarian to the duke of Devonshire, in succession to her husband, and in 1909 was appointed assistant director of the British School of Archaeology in Rome, a post which she held until 1925

Her publications include *Roman Sculpture from Augustus and Constantine* (1907; new ed. in Italian, 1923); *Apotheosis and After Life* (1915); *Art in Rome* (1927). She is also the English editor of G. Schuchardt's *Schliemann's Excavations,* Furtwängler's *Masterpieces of Greek Sculpture* and F. Wickhoff's *Roman Art.*

STRONG ROOMS: *see* SAFES, STRONG ROOMS and VAULTS

STRONTIANITE, a mineral consisting of strontium carbonate $SrCO_3$. It takes its name from Strontian in Argyllshire, where it appears to have been known as far back as 1764, but it was not recognized as a distinct mineral until later, when the examination of it led to the discovery of the element strontium. It crystallizes in the orthorhombic system and is isomorphous with aragonite and witherite. Distinctly developed crystals are, however, of rare occurrence; they are usually acicular with acute pyramid-planes and are repeatedly twinned on the prism. Radiating, fibrous or granular aggregates are more common. The colour is white, pale green or yellowish brown The hardness is 3·5 and the specific gravity 3 7. The mineral occurs in metalliferous veins in the lead mines of Strontian in Argyllshire, Pateley Bridge in Yorkshire, Bräunsdorf near Freiberg in Saxony, abundantly in veins in calcareous marl near Münster and Hamm in Westphalia and in limestone at Schoharie, N.Y. It is used for producing red fire in pyrotechny and for refining sugar.

STRONTIUM, a metallic chemical element (symbol Sr atomic weight 87·63, atomic number 38), belonging to the alkaline earth group It is found in small quantities very widely distributed in various rocks and soils, and in mineral waters; its chief sources are the minerals strontianite, celestine and barytocelestine The metal was detected in the mineral strontianite, found at Strontian, in Argyllshire, by Cruikshank in 1787, and by Crawford in 1790; and the discovery was confirmed by Hope in 1792 and by Klaproth in 1793

The metal was isolated (possibly not quite free from mercury) in 1808 by Sir H. Davy, who electrolysed a mixture of the moist hydroxide or chloride with mercuric oxide, using a mercury cathode. It has been obtained in a state of purity by A Guntz and Roederer by heating the hydride in a vacuum to 1,000° C It may be obtained in the form of sticks by the "contact cathode" method, in which a cooled iron rod, acting as a cathode, just touches the surface of a fused mixture of potassium and strontium chlorides and is raised as the strontium collects on it Few, if any, of the amalgams are chemical individuals; the richest in strontium contains 52% and distils unchanged. Strontium is a silver-white ductile metal (of sp gr. 2·54–2 63) which melts at 800°. It oxidizes rapidly when exposed to air, and burns when heated in air, oxygen, chlorine, bromine or sulphur vapour. With dry ammonia at −60° the metal forms strontium ammonium, which slowly decomposes in a vacuum at 20° giving $Sr(NH_2)_2$; excess of ammonia gives a dark blue solution, and evaporation gives bronze crystals of $Sr(NH_3)_6$ With carbon monoxide the metal gives $Sr(CO)_2$; with oxygen it forms the monoxide and peroxide

The *hydride,* SrH_2, obtained by Guntz on heating strontium amalgam in a current of hydrogen, is a white solid, which readily decomposes water in the cold and behaves as a strong reducing agent. The *monoxide* or strontia, SrO, is formed by strongly heating the nitrate, or commercially from the hydroxide which is produced by heating the sulphide or carbonate in superheated steam (at about 500–600° C). It is a white amorphous powder which resembles lime in its general character. By heating the amorphous form in the electric furnace H. Moissan succeeded in obtaining a crystalline variety. The amorphous form readily slakes with water, and the aqueous solution yields a crystalline hydrated hydroxide. It is used in the extraction of sugar from molasses, since it combines with the sugar to form a soluble saccharate, which is removed and then decomposed by carbon dioxide. A hydrated *peroxide,* approximating in composition to $SrO_2 \cdot 8H_2O$, is formed as a crystalline precipitate when alkali is added to an aqueous solution of a strontium salt containing hydrogen peroxide If all the solutions are above 50° and very concen-

trated, the anhydrous peroxide results.

Strontium fluoride, SrF_2, is obtained by the action of hydrofluoric acid on the carbonate, or by the addition of potassium fluoride to strontium chloride solution. *Strontium chloride*, $SrCl_2 \cdot 6H_2O$, is obtained by dissolving the carbonate in hydrochloric acid, or, commercially, by fusing the carbonate with calcium chloride and extracting the melt with water. It crystallizes in small colourless needles and is easily soluble in water; the concentrated aqueous solution dissolves bromine and iodine readily. By concentrating the aqueous solution between 90–130° C, or by passing hydrogen chloride into a saturated aqueous solution, a second hydrated form of composition, $SrCl_2 \cdot 2H_2O$, corresponding with dihydrated barium and radium chlorides, is obtained. The anhydrous chloride is formed by heating the hydrated chloride in a current of hydrogen chloride.

Strontium sulphide, SrS, is formed when the carbonate is heated to redness in a stream of sulphuretted hydrogen. It phosphoresces very slightly when pure. *Strontium sulphate*, $SrSO_4$, found in the mineral kingdom as celestine, is formed when sulphuric acid or a soluble sulphate is added to a solution of a strontium salt. It is a colourless, amorphous solid, which is almost insoluble in water, its solubility diminishing with increasing temperature; it is appreciably soluble in concentrated sulphuric acid. When boiled with alkaline carbonates it is converted into strontium carbonate.

Strontium nitride, Sr_3N_2, is formed when strontium amalgam is heated to redness in a stream of nitrogen or by igniting the oxide with magnesium. It is readily decomposed by water, with liberation of ammonia. *Strontium nitrate*, $Sr(NO_3)_2$, is obtained by dissolving the carbonate in dilute nitric acid. It crystallizes from water (in which it is very soluble) in monoclinic prisms which approximate in composition to $Sr(NO_3)_2 \cdot 4H_2O$. It is used in pyrotechny for the manufacture of red-fire.

Strontium carbide, SrC_2, is obtained by heating strontium carbonate with carbon in the electric furnace. It resembles calcium carbide, decomposing rapidly with water, giving acetylene. *Strontium carbonate*, $SrCO_3$, found in the mineral kingdom as strontianite, is formed when a solution of a carbonate is added to one of a strontium salt. It loses carbon dioxide when heated above 1,250° C.

Strontium salts may be recognized by the characteristic crimson colour they impart to the flame of the Bunsen burner and by the precipitation of the insoluble sulphate. Strontium salts are only very feebly toxic.

Bibliography.—J. W. Mellor, *Comprehensive Treatise on Inorganic Chemistry;* J. A. Newton Friend, *Text-book of Inorganic Chemistry.*

STROPHANTHUS, a genus of plants of the family Apocynaceae, deriving its name from the long twisted thread-like segments of the corolla, which in one species attain a length of 12 to 14 inches. The genus comprises about 28 species, mainly tropical African, extending into South Africa, with a few species in Asia, from Farther India to the Philippines and China. Several of the African species furnish the natives with the principal ingredient in their arrow poisons—*S. hispidus* and *S. kombe* being probably most frequently employed.

Both *S. hispidus* and *S. kombe* have hairy seeds with a slender thread-like appendage, terminating in a feathery tuft of long silken hairs, the seeds of the former being coated with short appressed brown hairs, and those of the latter with white hairs; but in the species used at Delagoa bay and called "umtsuli" the thread-like appendage of the seed is absent. The natives pound the seeds into an oily mass, which assumes a red colour, portions of this mass being smeared on the arrow immediately behind the barb.

Under the name of *strophanti semina*, the dried ripe seeds of *Strophanthus*, freed from awns, are official in the British and many other pharmacopeias. The seeds must be mature. They are about ¾ in. long, ⅙ in. broad, greenish fawn, covered with flattened silky hairs, and oval-acuminate in shape. They are almost odourless, but have an intensely bitter taste. The chief constituent is a white microcrystalline glucoside, known as strophanthin, freely soluble in water and alcohol, but not in chloroform or ether, and melting at about 173° C. It constitutes about 50% of the mature cotyledons of the mature seed. The resin is contained in the husk, and occurs in the alcoholic tincture of strophanthus.

Pharmacology.—The drug has no external actions. Taken internally it tends, after the repetition of large doses, to produce some gastric irritation. As ordinarily administered, the drug acts on the heart before influencing any other organ or tissue. It is almost certain that strophanthus acts directly on no other cardiac structure than the muscle-fibre. No action can certainly be demonstrated either upon the vagus nerves or upon the intracardiac nervous ganglia. The muscular force is increased in a very marked degree. A secondary consequence of this is that the diastole is prolonged, and the pulse thus rendered less frequent. If the heart is beating irregularly the drug tends to make it more regular. In fatal cases of strophanthus poisoning death is brought about by the arrest of the heart in systole, *i.e.* in a state of tetanic spasm from over-stimulation. Strophanthus markedly raises the blood-pressure, but this action is almost entirely due to the increased force of the heart.

STROPHE, a term in versification which properly means a turn, as from one foot to another, or from one side of a chorus to the other (Gr. *στροφή*, "a turn"). Hence, the song of a chorus during one turn or figure of a dance, and thus a collection of various prosodical periods combined into a structural unit. When the strophe is answered by another unit of identical scansion (called an antistrophe) and accompanied by a third of somewhat different structure (epode), the three form a period.

STROSSMAYER, JOSEPH GEORGE [Jošip Juraj Štrossmajer] (1815–1905), Croatian bishop and politician, was born at Esseg in Croatia-Slavonia on Feb. 4, 1815. He became lecturer on theology at Djakovo, chaplain to the Austrian emperor, and director of the Augustinian body at Rome. In 1849 he was consecrated bishop of Djakovo, with the official title "Bishop of Bosnia, Slavonia and Sirmium." He fostered the growth of Slavonic nationalism in Croatia-Slavonia, in Dalmatia, and among the Slovenes of south Austria, aiding the Ban Jellačić in his campaigns against Hungary (1848–49), and subsequently becoming a recognized leader of the opposition to Hungarian predominance. (*See* Croatia-Slavonia.) Besides being foremost among the founders of the South Slavonic Academy in 1867, and of Agram University in 1874, he helped to reorganize the whole educational system of Dalmatia and Croatia-Slavonia. He built a palace and cathedral at Djakovo, founded a seminary for the Bosnian Croats, presented the South Slavonic Academy with a gallery of valuable pictures, and published collections of national songs and tales. He also aided Augustin Theiner, then librarian at the Vatican, to compile his *Vetera monumenta Slavorum meridionalium historiam illustrantia* (Rome, 1863). Strossmayer died on April 10, 1905. He was a count of the Holy Roman Empire and a bishop of the pontifical throne.

STROUD, market town, urban district, Stroud parliamentary division, Gloucestershire, England, 102½ m. W. of London. Pop. (1921) 8,543. It is served by the G.W. and L.M.S. railways. It lies in a narrow through-valley of the Cotswolds traversed by canals from Thames to Severn. The town hall is Elizabethan. Stroud is the principal seat of the west of England cloth manufacture. Stroud has also silk-mills, dyeworks, breweries and foundries. During 1832–85 Stroud returned two members to parliament; it was merged in the Stroud division of Gloucestershire.

STROUDSBURG, a borough of eastern Pennsylvania, U.S.A., the county seat of Monroe county; on Broadhead creek, opposite East Stroudsburg (*q.v.*). It is served by the Delaware Valley, the Erie, the Lackawanna, the New York, Susquehanna and Western and the Pennsylvania railways. Pop. (1920) 5,278 (94% native white). Stroudsburg is a summer resort three miles W. of the Delaware Water Gap and 15 m. from the heart of the Pocono mountains. It has various manufacturing industries. A number of colonial houses still stand, notably the Jacob Stroud mansion (1760) which served as a refuge at the time of the Wyoming Massacre. The borough was laid out in 1806.

STROZZI, the name of an ancient and noble Florentine family, which was already famous in the 14th century. Palla Strozzi (1372–1462) founded the first public library in Florence in the monastery of Santa Trinita. Filippo Strozzi il Vecchio

(1426–1491), son of Matteo and of Alessandra Macinghi, began to build the beautiful Strozzi palace in Florence. Another Filippo Strozzi (1488–1538), who, although married to a Medici, opposed the hegemony of that house and was one of the leaders of the rising of 1527. On the final overthrow of the republic in 1530 Alessandro de' Medici attempted to win over Filippo Strozzi, but Strozzi had no faith in the tyrant and retired to Venice. After the murder of Alessandro he undertook the leadership of a band of republican exiles with the object of re-entering the city (1537); but having been defeated and captured and put to the torture, he committed suicide. His son Leone (1515–1554) was a distinguished admiral in the service of France and fought against the Medici; he died of a wound received while attacking Sarlino. The Strozzi acquired by marriage the titles of princes of Forano, dukes of Bagnolo, etc. The Strozzi palace, which belonged to the family until 1907, was bequeathed by will to the Italian nation.

See A Bardi, *Filippo Strozzi* (Florence, 1894); B. Niccolini, *Filippo Strozzi* (Florence); C. Guasti, *Le Carte Strozziane* (Florence, 1884–91),

STRUCTURAL ENGINEERING. The term structural engineering came into accepted use in America during the 19th century, in relation to the particular branch of civil engineering which was concerned with bridge building At a later date the term came to be used more frequently in connection with the great development of steel-framed and reinforced concrete buildings in that country, and it is mainly in this connection that the term has been accepted and used throughout the world

From the brief survey in this article of the development of structural practice, it will be seen that the most fundamental change has not been in the use of mild steel, or, in fact, in the use of any relatively new material, but in the intelligent application in the design of structures of a rapidly extending knowledge of mechanics and of the scientific use of constructional materials. Hence there is a general tendency to give a wider significance to the term structural engineering and to set no arbitrary limits either to the materials employed or to the nature of the structures in which they are embodied.

Structural engineering embraces the design and construction of all those vital structural parts of buildings, and other substantial erections, in which a knowledge of the strength and nature of the materials used and of the relevant principles of the science of mechanics are the controlling factors. *See* also the articles on ARCHITECTURE and BRIDGES: CONSTRUCTION.

Early Development of Structural Practice.—While the more modern developments of structural engineering have been largely coincident with and dependent upon parallel developments in the production and use of iron, steel and Portland cement, the development of the science of mechanics and of the theory of elasticity have occupied a much longer period of time. Until the middle of the 18th century constructional practice of all kinds had been chiefly governed by the common traditions accepted in the various crafts. This practice was subject to the losses, faults and checks to which knowledge so acquired and held is peculiarly liable. The high state of development of the science of stereotomy or jointing of stone work should, however, be noted, particularly as applying to stone arches, vaults and domes. It arose out of the construction needs of the great cathedrals of the Middle Ages. The great era of bridge building, which may be said to have been initiated by the erection of the second bridge over the Thames at London by the French engineer Labelye in 1749, and by the successful completion of William Edwards' third bridge at Pontypridd in 1755, continued for the remainder of that century, and may be credited with the establishment of a new era in constructive ability and knowledge. At later dates notable bridges were erected by Robert Mylne, Telford and Rennie, which carried this aspect of structural design to an advanced stage.

Use of Cast Iron.—In England in 1755, the use of cast iron in construction had been advocated by Smeaton, and by the end of the century much experience had been acquired in the production of a uniform and reliable material and in the possibilities of its use in buildings. The most striking use of the metal probably occurred in the construction of arched bridges, where cast-iron voussoirs were employed in the place of stone; the first bridge of this kind was completed at Coalbrookdale in 1776. (Much confidence was shown in this type of bridge construction and Rennie prepared designs for a cast-iron bridge of 450 ft. span over the Menai straits.) At a still later date the cast-iron units were made in longer sections and bolted together, so that they were called upon to resist tensile forces and the sections of the ribs approximated to cast-iron beams of curved outline.

Meanwhile, the use of cast-iron in the construction of factory buildings in the north of England was developed, first in columns to support timber beams, and later in the substitution of cast-iron beams for timber At the commencement of the 19th century, a building was designed by Boulton and Watt and erected in Manchester, in which cast-iron beams were supported on cast-iron columns, while the floors consisted of brick arches supported on the bottom flanges of the beams and brought to a level surface by rough concrete. Buildings of this type were erected with little change for a long period The principles underlying this form of construction were at first little understood, but such men as Fairbairn, Tredgold and Hodgkinson assisted in the establishment of sound principles; their work was based upon extensive experiments, mainly upon the use of cast-iron in beams, and their published results proved of great benefit to architects and builders.

Use of Wrought Iron and Steel.—The great improvements in the manufacture of wrought iron, which followed upon the introduction and development of the puddling furnace and the rolling mill by Henry Cort towards the end of the 18th century, led to its increased use in construction, while the investigations into the strength of cast-iron referred to above probably stimulated the more effective use of wrought iron, the nature of which approximated more closely to the ideal elastic material conceived by the mathematicians and physicists Only the simplest sections were rolled in the solid, beams.

In 1847 Ferdinand Zores produced a small rolled joist or I-section, the form being decided upon after consultation with French builders and iron manufacturers. Larger rolled sections were on view at the Paris exhibition in 1855 and these I-sections had been advocated by Fairbairn in England. The early small rolled joists were largely used in France as the basis of fire-resisting floor construction, but while they were obviously of value in other forms of construction, the I-section came very slowly into general use The first steel-joist section to be produced in England was rolled by Dorman and Long in 1855. The Harper building in New York built in 1854 was the first one to have wrought-iron beams set in masonry walls as lateral supports

Cheap and reliable mild steel became available through the introduction of the Bessemer and Siemens-Martin processes of production but prejudice and early difficulties in manufacture delayed its use. As late as 1877 in England Board of Trade Regulations prohibited the use of mild steel in bridge construction. In the construction of the Forth bridge (1880–90) mild steel was, however, employed and the success of this venture constitutes a remarkable tribute to the skill of the structural engineers at that date and a testimony to the fitness and reliability of this material for bridge work and general constructional use. The extended use of steel for structural purposes was assisted and guided by the introduction of standard forms and dimensions, and by uniform specifications. The American Society of Civil Engineers, founded in 1852, in co-operation with the steel manufacturers contributed immensely to the development of standard formulae In 1894 the Carnegie-Phipps company of Pittsburgh published a handbook of standard shapes with information and formulae as to their structural properties. These remained standard for years and were basic for many subsequent handbooks published In American cities, where skyscraper construction started, building laws were passed giving effect to the conclusions of these early developments. In England specifications were issued by the British Engineering Standards Association (formed in 1904), and the passing of the London County Council (General Powers) Act of 1909, provided the first authoritative regulations for the control of the design of steel-framed buildings.

Development of Framed Construction.—In the construction of various kinds of framed structures iron was being used to

a considerable extent by the middle of the 19th century; thus the technique of this form of construction was being steadily developed. In some of the larger structures pin joints were used, but these were gradually discarded in England and the simpler riveted joint adopted. Of this latter type of construction Tueller's lattice girder bridge (1868) consisting of 300 ft. spans over the Mersey at Runcorn is a good example.

At a somewhat earlier period, similar developments in framed construction were taking place in America, where road bridges were being erected to meet a great demand. The majority of these were constructed in timber alone, or in timber and iron, but the well known forms of Howe truss (1830) and Pratt truss (1844) which were developed in this connection represented substantial progress in the design of framed structures. At a later date, the development of the wire rope by Robling, applied in the construction of the great suspension bridge at Brooklyn, indirectly influenced the introduction and perfection of the lift or elevator, which became, and is now, so vital an equipment of all tall buildings.

While a considerable amount of iron was used in the construction of buildings until well into the latter half of the 19th century, the construction of normal types was based on the assumption that the walls constituted the chief supports for transmitting structural loads to the foundation; also, since the thicknesses of these walls were regulated by building by-laws—which were based upon tradition and custom rather than upon scientific conclusion—the height to which buildings could be economically carried was limited, owing to the thick walls necessary to conform with the by-laws. Moreover high building possessed no great advantage without lifts. The first passenger elevator, a "vertical screw railway," was installed in 1859, by Otis Tufts in the Fifth Avenue Hotel in New York. In 1866 the first suspended elevator operated by a steam hoist was installed in the St. James Hotel in the same city.

The Crystal Palace buildings, erected by Paxton for the 1851 Exhibition in Hyde Park, are not usually claimed as one of the early examples of iron-framed buildings, yet the structure is remarkable in having foreshadowed and established a principle adopted in the modern steel building, in which the walls do not transmit any important portion of the structural load to the foundation. It was, however, the developments which took place in America at a later date which were to influence most markedly the progress of this form of construction throughout the world. In the year 1883, during a period of unusual building activity in Chicago and following an extensive fire in that city, W. L. B. Jenney designed a building of 10 storeys that is the forerunner of all high buildings. Afterwards two storeys were added, making the building 12 storeys, proving the soundness of the original calculations. This building, the Home Insurance building, is the first of all skyscrapers. It was finished in 1885. While it is true that L. S. Buffington, a young architect in Minneapolis, had thought of steel skeleton structures as early as 1880, it remained for Mr. Jenney to put the problem to practical test. There is, however, some controversy regarding who should get credit for the first skeleton construction building.

Skeleton Construction.—The Home Insurance building was designed with relatively thin outer walls, the dead load of which is placed on a framework of iron concealed inside the masonry and used to transmit the weight to the foundation. The framework was made of cast iron column and wrought iron I-beams, the beams being bolted to the columns with angle iron brackets. At the suggestion of the Carnegie-Phipps Steel company, rolled Bessemer steel beams, then being first produced, were used above the fifth floor. Cast-iron columns were used to the top since plates and angles of steel, of which the later steel columns were built up, had not yet been rolled. The term skeleton construction was later applied to all buildings of this type. Besides the development of the steel framework, the elevators, the use of Portland cement, another factor of great importance in the creating of skyscrapers was the invention of hollow tile in 1871 by Balthaser Kreisher, which solved both the dead-weight and the fire protection problem

The advantages to be derived from the erection of high buildings on city sites were rapidly recognized both by the land-owner and the building-owner; site values were enormously increased and much greater accommodation became available on a restricted area. The adoption of skeleton construction also led to speedier erection, since, on the completion of the steel framing, the building of walls and the construction of the floors could proceed simultaneously on several floor levels.

As confidence in the type of building increased, higher and yet higher structures were erected, and since most of them were relatively slender and were frequently built on sites that afforded poor foundations, the use of piles and of the caisson—already adopted by the bridge builder to ensure sound foundations—increased and developed. Improved practice in the construction of foundations became fundamentally important in the further growth of this type of building, and many ingenious and effective developments occurred, including combined foundations for two or more columns, and also cantilevered foundations, by means of which the actual foundation construction for the external or boundary columns could be kept within the limits of the site. (*See* article on FOUNDATIONS.)

Protection from Fire.—Early experience showed the very complete destruction by fire of iron and steel buildings in which the distortion of the framework, under the effects of excessive heat, resulted in the collapse of the metal framework and walls. The importance of fire protection is now generally recognized and the vital parts of steel buildings are required to be protected by terra-cotta, hollow tile, cement concrete or other fire-resisting materials. In America a definite limit of height is generally set by the building regulations for the control of non-fireproof buildings. but if adequate and ample fire-protection of the structural fabric is provided in the permanent construction, no arbitrary limit is set to the height in some American cities; in others there are height limitations. It is necessary, however, to provide, for all high buildings efficient warning, fire-checking and fire-fighting equipment. such as stand-pipes and extinguishers, especially at heights beyond the scope of the local fire-fighting equipment. The work of the various Fire Assurance companies and, more recently, the effective research and investigations of the National Board of Fire Underwriters, has influenced fire-protection, assisted in the improvements of constructional methods, and helped to render these improvements rapidly effective. In Great Britain, structural practice and consequent building developments have been somewhat different from those of America. Very high buildings have not been favoured for a variety of reasons which are referred to elsewhere in this article. One of the arguments that was used in the past against high buildings was the difficulty of dealing with fires at great heights. Experience in America, however, has proved that adequate provisions can be made to meet such emergencies.

Wind Pressure.—There are obvious dangers associated with tall structures, which arise chiefly from the effects of wind pressure upon the exposed elevated faces. Stability of the structures as a whole is now generally obtained by a combination in the building of rigidity and weight. While the steel frame in itself is sufficiently rigid to reduce distortion under wind pressure to a negligible amount, in all calculations the rigidity of the walls is taken into consideration, as it is a considerable factor in resisting distortion. The necessity for maintaining a rigid form of frame which would resist distortion under side pressure has led to the development of the braced structure and of the structure with rigid connections. Both these types demand of the designer a knowledge of the most advanced sections of mechanics and structural engineering. Much experimental research upon problems associated with tall structures has been carried out in the universities of America and by American engineers, from which satisfactory bases of design have been developed or theories verified. The progress of framed construction in tall buildings has enabled such a high degree of achievement to be reached, that careful experiments upon one of the tallest buildings recently erected in America have fully demonstrated that, even in the strongest gales, the little vibration that occurs is of no consequence in such structures.

Electric welding, to replace riveting, is still in the experimental

state. While no additional strength or rigidity is necessary than is provided by the riveted structure, two objects are being sought: the elimination of noise and the saving in steel that would result from not needing such heavy angles at the connections.

Corrosion.—During the later development of skeleton construction considerable attention was given to the dangers which might arise from the corrosion of important parts of these steel structures. In the earlier days of steel construction applied to buildings, insufficient care was given to the protection of hidden and inaccessible parts, and connections and members were often so designed and fabricated that protection was difficult to apply. A few failures have occurred owing to corrosion, but the recent demolition of some of the earliest tall buildings in America has demonstrated that, with reasonable care, the life of the ordinary type of steel-framed building may be practically indefinite if the work is properly done. At the same time the investigation has led to the recognition of the value of concrete as a suitable and effective encasing material for the protection of steel Reliable and durable protective paints have been produced and are now in wide use for the treatment of steel framework to be enclosed in masonry They should be freely applied in at least two coats to all parts where actual encasing in solid concrete is not specified. Some hopes are entertained that a solution of the problem of corrosion will be found in the production of non-corrosive steel, having the necessary structural properties and yet economical in production

Building Regulations.—The extent to which the adoption of suitable building regulations has assisted in the development of efficient and economical methods of construction has varied in different countries. In Great Britain, the type of local by-law which has generally been in force has lagged seriously behind the best accepted modern practice and has often acted as a deterrent to such development. In relation to the construction of walls the regulations have had a restrictive effect since they have compelled the erection of exceptionally thick walls. In relation to other parts of buildings such as roofs, floors and columns these by-laws are usually inadequate and arbitrary and, while they may be of a character to prevent the erection of unsafe structures, they have not tended to encourage the adoption of better forms of construction.

The first and the most outstanding regulations to govern steel building construction in Great Britain were embodied in the London County Council (General Powers) Act of 1909, and are usually referred to as the L.C.C. Regulations for Steel-Framed Buildings. These regulations, while containing some peculiar features and restrictions, had a marked effect upon the development of this form of construction and there has since been a steady increase in the number of buildings erected in accordance with them. At present, practically all large buildings erected in London, apart from reinforced concrete structures, are designed and erected as steel-framed buildings.

In consequence of the manner in which the L.C.C. regulations were framed, they applied only to new buildings in which the main structure was to be of steel, while buildings in which steel was combined structurally with other materials were still subject to the older regulations. This lack of co-ordination has tended to discourage forms of composite construction which, for smaller buildings would often have produced more economical results. Under the London County Council (General Powers) Act 1926 efforts are being made to remove these and other anomalies.

In the United States a much closer relation has been established between regulations and practice, and many thorough revisions of local building codes, particularly in their effect on steel construction, have been undertaken during the last twenty years in American cities. The general methods of procedure and supervision adopted by authorities in the United States are more elastic in practice than in Great Britain, so that the regulations do not tend so much to discourage the best available methods offered by the engineers and contractors; the system in vogue is indeed equivalent to a continual revision of the regulations, thus encouraging constant progress and improvement.

In this connection the investigations carried out by the Bureau of Standards in Washington, D.C., and by various professional bodies have proved most valuable, the results of such investigations—conducted under practical and exhaustive conditions—being incorporated in the various building codes when approved and accepted by the responsible and representative professional institutions.

Reinforced Concrete.—The adoption and development of construction in reinforced concrete has followed the lines common to steel work, since the theoretical basis is almost identical, and the production of suitable specifications and regulations has been the product of similar efforts. Reinforced concrete buildings are usually of the framed type of construction, consisting of pillars and beams, as in steel work, but with the wall and floor panels continuous between columns and beams, so that the concrete enclosing the reinforcing steel is continuous and the structure is monolithic in character. All the intersections of beams and columns are thus rigid connections and the rigidity of such structures is one of their main features. In recent years the study of elasticity has been closely followed in its application to reinforced work, where the straining of one member is definitely communicated through the rigid continuation to the adjoining members. Hence the designer of reinforced concrete must have an unusually thorough structural training if he is to comprehend and provide successfully for all the variations of stress to which a reinforced structure is subject. The development of the theory of indeterminate structures involving rigid connections has been a natural consequence A later type of construction dispenses with beams and uses slabs and mushroom-headed pillars.

Reinforced concrete reached an established position as a constructional method in England when a joint committee, under the auspices of the Royal Institute of British Architects, considered and reported on the subject, first in 1907 and later in 1911. The report gave advice and guidance upon this form of construction in the absence of local regulations. As early as 1900 American engineers had developed the technique of reinforced concrete to a high degree.

In 1915 the London County Council, using the authority vested in them under the clauses of the L C C. (General Powers) Act 1909, made regulations for the control of buildings erected in reinforced concrete. While, in view of later developments and scientific investigation, these regulations are seen to be faulty, they were accepted at the time as a real help to the architect, builder and engineer, because at that time there was little general recognition of the more intricate problems involved in its use The regulations include data for the practical design of beams, slabs, columns, foundations and walls, and a specification of materials and minimum strengths under test. These regulations now are in need of revision, because of the great advance in knowledge concerning this work. In the United States various changes have been made in the early rules with the result that more adequate requirements are in force.

Owing to the experience gained in actual design and construction and to the greatly extended investigations which have been conducted into the properties of this new material, reinforced concrete appears not only low in maintenance cost, but is of satisfactory permanence. In addition it possesses fire-resisting qualities. Contradictory data, however, indicate that more knowledge of the action of concrete under various conditions is necessary before definite conclusions can be drawn. Owing mainly, perhaps, to the severely classical character of the normal architectural training, concrete cannot be said to have attained the same pre-eminence as a material for architectural expression as it has in construction. However, some interesting, though perhaps exceptional, schemes have been produced by the so-called "modernist" architects and structural designers. (*See* also CONCRETE and REINFORCED CONCRETE.)

Structural Engineer and Architect.—It is recognized that structural engineering developed in its initial stages as a specialized branch of civil engineering, and its most prominent developments took place in connection with those pioneering ventures of mankind in the furtherance of which the skill and ability of the civil engineer is of paramount importance. Later developments,

however, especially in countries where industrial and commercial conditions are now more stable, have resulted in establishing conditions in which the work of the structural engineer is, in nature and quality, much more closely related to that of the architect. It follows, therefore, that as a knowledge of the theory and practice of structural engineering becomes more established and widespread, it will become more difficult to distinguish clearly between the work of the architect and that of the structural engineer in regard to the design and construction of tall fireproof buildings.

There are at present, in all countries, numbers of architects who have prepared themselves to undertake responsibility both for architectural design and structural engineering in relation to all the forms of building in which they practise, the combination being most frequently found in Continental countries. In Great Britain, where the private architectural practice still predominates, the employment of a structural engineer as a consultant, or as a specialist, appears to be the normal procedure. In view of the general recognition of the advantages of specialization, and of the difficulties inherent in scientific construction, there is little doubt that the structural specialist will remain a distinct and important person among those who are responsible for the design of future buildings.

Building Skyscrapers in the United States.—The great demand for tall buildings that started at the end of the last century produced a new form of organization to handle their construction. In the past the work was done on a divided contract where work was parcelled out to various contractors who worked under the supervision of the architect who had designed the building. Then, due to the magnitude and complication of the work and the overburdening of the architect, the general contractor appeared, who was prepared to undertake the building of a skyscraper under a general contract in which he agreed to deliver the completed building on a given date. The contractor became a promoter, a financier, a buyer of materials, a large employer of labour, and principally an organizer who could combine all building trades and functions under a centralized management. The architect usually, therefore, became responsible only for architectural and structural design.

(F. E. D.; J. L. M.; W. A. St.)

See Col. W. A. Starrett, *Skyscrapers* (1928).

STRUENSEE, JOHAN FREDERICK (1731–1772), Danish political philosopher, was born at Halle in 1731. His father, subsequently superintendent-general of Schleswig-Holstein, was a rigid pietist; but young Struensee, who settled down in the 'sixties as a doctor at Altona, revolted against the narrowness of his father's creed, became a fanatical propagandist of the doctrines of the encyclopaedists. He became court physician to Christian VII. Struensee rapidly gained authority in affairs.

For a time Struensee kept himself discreetly in the background, but he soon grew impatient of his puppets. He dismissed the heads of departments, and abolished the Norwegian stadholderships. Henceforth the cabinet, with himself as its motive power, was to be the one supreme authority in the state. He then began to reform the administration and the law without any regard to national customs and predilections. Between March 29, 1771, and Jan. 16, 1772—the ten months during which he held absolute sway—he issued no fewer than 1069 cabinet orders, or more than three a day. In order to be sure of obedience he dismissed wholesale without pension or compensation the staffs of all the public departments, substituting nominees of his own.

The general ill will against Struensee, which had been smouldering all through the autumn of 1771, led to a conspiracy against him, headed by Rantzau-Ascheburg and others, in the name of the queen-dowager Juliana Maria. On Jan. 17, 1772 Struensee, Brandt, the unhappy king's keeper, and the queen were arrested, and "the liberation of the king," who was driven round Copenhagen by his deliverers in a gold carriage, was received with universal rejoicing. On April 25 Struensee and Brandt were condemned first to lose their right hands and then to be beheaded; their bodies were afterwards to be drawn and quartered. The sentences were carried out on April 28, Brandt suffering first.

(Copenhagen, 1897–1905); Gustave Bascle De Lagrèze, *La Reine Caroline-Mathilde et le Comte Struensee* (Paris, 1887); Robert Nisbet Bain, *Scandinavia*, cap. xv. (Cambridge, 1905); William Henry Wilkins, *A Queen of Tears* (London, 1904); Georg Friedrich von Jenssen-Tusch, *Die Verschwörung gegen die Königin Karoline Mathilde und die Grafen Struensee und Brandt* (Leipzig, 1864).

STRUTHERS, a village of Mahoning county, Ohio, U.S.A., on the Mahoning river, 5 m. S.E. of Youngstown; served by the Pennsylvania and the Pittsburgh and Lake Erie railways. Pop. (1920) 5,847 (25% foreign-born white). Struthers is a residential and industrial suburb of Youngstown, with large steel and iron works and various other manufacturing plants.

STRUTHIONIDAE: *see* Ostrich.

STRUTT, JEDEDIAH (1726–1797), British inventor and manufacturer, was born at South Normanton, Derbyshire, on July 28, 1726. He was a farmer, as his father had been before him. His brother-in-law, William Woollatt, brought to his notice the unsuccessful efforts to produce ribbed as well as plain goods on the stocking frame, and he invented Strutt's Derby ribbing machine. Patents were taken out by Strutt and Woollatt in 1758 and 1759. Strutt then started a factory with Woollatt at Derby, and in 1762 took in Samuel Need as a partner. In 1768 Richard Arkwright (*q.v.*) consulted Need as to the possibilities of his cotton-spinning frame which led to Arkwright, Strutt and Need starting their first cotton mill at Nottingham, with horse power.

Later works were erected at Cromford and, about 1780, after Strutt dissolved partnership with Arkwright, he built himself the mills at Belper and Milford. Shortly before this Strutt had made the discovery, which revolutionized the manufacture of calico, that cotton could be used throughout in its making. To house the machinery for this new invention the first fire-proof mill in England was built at Derby.

STRUVE, FRIEDRICH GEORG WILHELM (1793–1864), German astronomer, was born at Altona on April 15, 1793. In 1808 he entered the university of Dorpat (Yuriev). He remained at Dorpat, occupied with researches on double stars and geodesy till 1839, when he removed to superintend the construction of the new central observatory at Pulkowa, afterwards becoming director. He retired in 1861 and died at St. Petersburg on Nov. 23, 1864.

Struve's name is best known by his extensive observations of double stars; his publications on this branch of astronomy are *Catalogus novus stellarum duplicium* (1827); his principal work, *Stellarum duplicium et multiplicium mensurae micrometricae* (St. Petersburg, 1837); and *Stellarum fixarum imprimis duplicium et multiplicium positiones mediae* (1852). At Pulkowa, in 1840, he obtained a parallax of $\frac{1}{4}''$ for α Lyrae; this was one of the first measurements of stellar parallax. For the rest of his life Struve was chiefly occupied in working out the results of former years' work and in the completion of geodetic operations. He had commenced them with a survey of Livonia (1816–1819), which was followed by the measurement of an arc of meridian of more than $3\frac{1}{2}°$ in the Baltic provinces of Russia (*Beschreibung der Breitengradmessung in den Ostseeprovinzen Russlands*, 2 vols., 4to, Dorpat, 1831). This work was afterwards extended by Struve and General Tenner into a measurement of a meridianal arc from the north coast of Norway to Ismail on the Danube (*Arc du méridien de 25° 20′ entre le Danube et la Mer Glaciale*, 2 vols. and 1 vol. plates, 4to, St. Petersburg, 1857–1860). (*See* Geodesy; Earth, Figure of.)

STRYCHNINE, $C_{21}H_{22}N_2O_2$, an alkaloid discovered in 1818 in St. Ignatius's beans (*Strychnos Ignatii*); it also occurs in other species of *Strychnos*, *e.g.*, *S. Nux vomica*, *S. colubrina*, *S. Tieuté*, and is generally accompanied by brucine, $C_{23}H_{26}N_2O_4 \cdot 4H_2O$. Strychnine crystallizes from alcohol in colourless prisms, practically insoluble in water, and with difficulty soluble in the common organic solvents. Its taste is exceptionally bitter. It has an alkaline reaction, and is a tertiary monacid base.

In Medicine.—The British Pharmacopoeia dose of *strychnine* is $\frac{1}{60}$ to $\frac{1}{15}$ gr. Easton's Syrup is *syrupus ferri phosphatis cum quinina et strychnina*, containing $\frac{1}{32}$ gr. of strychnine in each fluid

drachm. *Strychninae hydrochloridum* is also used; it is much more soluble than strychnine. From it is prepared *liquor strychninae hydrochloridi,* containing 1gr. of hydrochloride in 110 minims. The United States pharmacopoeia also contains *strychninae nitras* and *strychninae sulphas.* Strychnine is incompatible with *liquor arsenicalis* and potassium iodide.

As regards its physiological action, strychnine enters the blood as such, being freely absorbed from mucous surfaces or when given hypodermically. Internally it acts as a bitter, increasing the secretion of gastric juice and intestinal peristalsis. The specific effects of the drug, however, are upon the central nervous system. It excites the motor areas of the spinal cord and increases their reflex irritability. Small doses increase the sensibility of touch, sight and hearing; large doses cause twitching of the muscles and difficulty in swallowing; while in overdoses violent convulsions are produced The cerebral convolutions remain unaffected, but the important centres of the medulla oblongata are stimulated Not only is the respiratory centre stimulated but the cardiac centre is acted upon both directly by the drug and indirectly for a time by the enormous rise in blood pressure due to the contraction of the arterioles all over the body Ordinary doses have no effect upon the temperature but in overdose the temperature rises during a convulsion Strychnine is eliminated by the kidneys as strychnine and strychnic acid It is excreted very slowly and therefore accumulates in the system.

In collapse following severe haemorrhage and arrest of the heart or respiration during chloroform narcosis an intramuscular injection of $\frac{1}{12}$gr. of the hydrochloride may stimulate the cardiac action In acute opium poisoning strychnine is very valuable. It is a physiological antagonist of chloral hydrate, morphine and physostigmine, and may be given in poisoning by these drugs.

Toxicology—The symptoms of strychnine poisoning usually appear within twenty minutes of the ingestion of a poisonous dose, starting with stiffness at the back of the neck, twitching of the muscles and a feeling of impending suffocation The patient is then seized with violent tetanic convulsions After a minute the muscles relax, and the patient sinks back exhausted, consciousness being preserved throughout Tetanus (*q v*) resembles strychnine poisoning, but the development of the symptoms in tetanus is usually much slower, death rarely occurring within 24 hours

The treatment of strychnine-poisoning is immediate evacuation of the stomach by stomach-pump or emetic, chloroform being administered to allay the spasms. Chloral and potassium bromide may be given as physiological antidotes.

STRYJ, a town of Poland in the province of Stanisławów Pop. (1921) 27,300. An important railway junction and a centre for the oilfields and the agricultural area of the province Mineral gas is produced in the neighbourhood. The town is situated on the Stryj river, a tributary of the Dniester. The town was once the capital of a Polish lieutenancy (Starostwo)

STRYPE, JOHN (1643–1737), English historian and biographer, was born in Houndsditch, London, on Nov. 1, 1643. He was the son of John Strype, or van Stryp, a member of a Flemish family settled in Strype's Yard in Petticoat Lane, as a merchant and silk throwster. The younger John was educated at St. Paul's School, and at Jesus college, and Catherine Hall, Cambridge. In 1670 he became perpetual curate of Theydon Bois, Essex, and subsequently received the curacy of Leyton and a sinecure living in Sussex He was lecturer at Hackney from 1689 till 1724. He died at Hackney on Dec. 11, 1737. He was buried in the church at Leyton.

The most important of Strype's works are the *Memorials of Thomas Cranmer, Archbishop of Canterbury, 1694* (ed. for the Eccl. Hist. Soc, in 3 vols., Oxford, 1848–1854; and in 2 vols. with notes by P. E. Barnes, London, 1853); *Life of the learned Sir Thomas Smith* (1698); *Life and Acts of John Aylmer, Lord Bishop of London* (1701); *Life of the learned Sir John Cheke, with his Treatise on Superstition* (1705); *Annals of the Reformation in England* (4 vols; vol. i. 1709 [reprinted 1725], vol. ii. 1725, vol. iii. 1728, vol. iv. 1731; 2nd ed, 1735, 4 vols.; 3rd ed, 1736–1738, 4 vols); *Life and Acts of Edmund Grindal, Archbishop of Canterbury* (1710), *of Matthew Parker, Archbishop of Canterbury* (1711), and *of John Whitgift, Archbishop of Canterbury* (1718); *An Accurate Edition of Stow's Survey of London* (1720), a valuable edition of Stow, although its interference with the original text is a method of editing which can scarcely be reckoned fair to the original author; and *Ecclesiastical Memorials* (3 vols, 1721; 3 vols, 1733) His *Historical and Biographical Works* were reprinted in 19 vols. at the Clarendon Press, Oxford, between 1812 (*Cranmer*) and 1824 (*Annals*).

STRZYGOWSKI, JOSEF (1862–), Austrian scholar, was born at Bial, near Bielitz, on March 7, 1862. In 1892 he became a professor at Graz, and in 1909 was appointed professor of art at the University of Vienna. He wrote numerous works on art, dealing especially with oriental influences on Western art (*see* BYZANTINE ART; ROMAN ART). His works include: *Byzantische Denkmaler,* 1–3 (1891–93); *Hellenistische und Koptische Kunst in Alexandria* (1902); *Koptische Kunst* (1903); *Die bildende Kunst der Gegenwart* (1907); *Ursprung der Christlichen Kirchenkunst* (1920, Swedish and English trans); and he edited *Early North European Church Art and Wood Architecture* (1925).

STSHERBATSKY, FEDOR IPPOLITOVICH (1867–), Russian orientalist, was born at St. Petersburg (Leningrad) on Sept. 19 (old style), 1867, of a family of old nobility. He was educated at Tsarskoye Selo, and studied philology at St. Petersburg, Vienna and Bonn. In 1904 he became professor of Indian literature at St. Petersburg. The years 1910–11 were spent in British India for scientific research. His knowledge of Tibetan languages and of Buddhism enabled him to enter into friendly relations with the leading Buddhist priests. He was invited to meet the Dalai Lhama, with whom he had several interviews without any interpreter. His thorough understanding of Buddhism makes his work, *The Theory of Knowledge and Logic according to the Later Buddhists* (1899), a most valuable book (German trans., 1924). He has published many Sanskrit mss in the *Bibliotheca Buddica* of the Academy of Sciences. In 1923 the Royal Asiatic Society published his work, *The Central Conception of Buddhism,* and in 1926 was published *The Conception of Nirvana.*

STUART, ARABELLA (1575–1615), daughter of Charles Stuart, earl of Lennox, younger brother of Lord Darnley and of Elizabeth, daughter of Sir William Cavendish and "Bess of Hardwick," was (by strict pedigree) next in succession to James VI. of Scotland to the thrones of England and Scotland, after Queen Elizabeth She became the centre of the intrigues of those who refused to accept James as Elizabeth's successor Suitors for her hand included Henry IV. of France, the earl of Northumberland, and Esmé Stuart, duke of Lennox. In 1590 a scheme was formed of marrying her to Ranuccio, eldest son of the duke of Parma, who was descended from John of Gaunt, and of raising her with Spanish support to the throne She was regarded with suspicion by Elizabeth and closely guarded at Hardwick by the dowager countess of Shrewsbury. In 1602 the queen's suspicions were increased by the discovery of a plot to marry Arabella to Edward, eldest son of Lord Beauchamp, who as grandson of Edward Seymour, earl of Hertford, and of Lady Catherine Grey, was heir to the throne after Elizabeth according to Henry VIII's will According to other accounts the intended husband was Thomas Seymour, a younger son of the earl of Hertford. Arabella planned an escape from Hardwick with the aid of her chaplain Starkey, who after its failure committed suicide. In December she wrote secretly to Lord Hertford proposing her marriage with his grandson, but the latter immediately informed the council In February 1603 another attempt at escape failed, and she was then transferred to the care of the earl of Kent at Wrest House. Arabella was received at the court of James I. and treated with favour, and she showed her fidelity to James by revealing a communication made to her by the conspirators in the Main and Bye Plots, in which her name had been used without her sanction. Every effort, however, was made to prevent her marriage. In December 1609 her plan to escape with Sir George Douglas to Scotland, apparently with a view of arranging a marriage with Stephen Bogdan, pretender to Moldavia, was discovered, and she was arrested She was, however, granted a pension of £1,600 a year by James. In 1610 she was married secretly in despite of the King's prohibition to William Seymour, younger brother of Edward, and grandson of Lord Hertford. They were imprisoned, Arabella at Lambeth and her husband in the Tower. In 1611 she was placed in charge

of the bishop of Durham. She escaped on June 3, 1611, and succeeded in boarding a ship bound for Calais. Her husband had also effected his escape and was sailing towards the French coast. Arabella was captured and brought back to the Tower, where she spent the rest of her unhappy career. She sank into melancholy, and, according to some accounts, insanity, and died on or about Sept. 25, 1615. She was buried in the tomb of Mary Queen of Scots in Henry VII.'s chapel in Westminster Abbey.

See also *The Life and Letters of Arabella Stuart*, by E. T. Bradley (1889), which supersedes the *Life* by E. Cooper (1866); and *Lives* by M. Lefuse (1913), and B. C. Bradley (1913).

STUART, GILBERT (1755–1828), American artist, was born at North Kingstown (R.I.) on Dec. 3, 1755. He studied at Newport (R.I.) with Cosmo Alexander, and went with him to Scotland, but returned to America after Alexander's death, and obtained many portrait commissions. In 1775 he went to England, and became a pupil of Benjamin West in 1778. His work, however, shows none of the influence of West, and after four years Stuart set up a studio for himself in London. He painted George III. and the future George IV., and in Paris he painted Louis XVI., and his success was no less great in Ireland. After five years he left Ireland for his native land in order to paint Gen. Washington, who was said to be the only person in whose presence Stuart found himself embarrassed. His first portrait Stuart felt was a failure; but Washington sat to him again, the result being the "Athenaeum" head on an unfinished canvas, showing the left side of the face. This remains the accepted likeness of Washington, of whom he also painted a full-length for Lord Lansdowne; of each of these portraits he executed many replicas. Among his portraits are those of Presidents Washington, John Adams, Thomas Jefferson, James Madison, James Monroe and John Quincy Adams, and John Jay, Governor Winthrop, Generals Gates and Knox, Bishop White, Chief Justice Shippen, John Singleton Copley, Sir Joshua Reynolds, Benjamin West, Lords Clinton, Lyndhurst, and Inchiquin, Sir Edward Thornton, Mme. Patterson-Bonaparte and Horace Binney. Stuart's original colouring and technique, and his insight into character, make him not only one of the few great American artists, but one of the greatest portrait-painters of his time. He settled at Boston in 1805, and died there on July 27, 1828.

See George C. Mason, *Life and Works of Gilbert Stuart* (1879).

STUART, JAMES EWELL BROWN (1833–1864), American soldier, was born in Virginia on Feb. 6, 1833 and entered West Point military academy in 1850. In 1859 Stuart, while staying in Washington on official business, was sent to assist Col. R. E. Lee in the suppression of the John Brown raid on Harper's ferry. Two years later when Virginia seceded from the Union Stuart resigned his commission in the United States army to share in the defence of his State. He had resigned as a lieutenant but he was at once made a colonel. With the scantiest of formal training his regiment was mustered into the Confederate army, and assigned to Joseph Johnston's force in the Shenandoah valley. At the first battle of Bull Run, Stuart distinguished himself by his personal bravery. Later in the year 1861 he was promoted brigadier-general and placed in command of the cavalry brigade of the Army of Northern Virginia. Just before the Seven Days' battle (*q.v.*) he was sent out by Lee to locate the right flank of McClellan's army, and not only successfully achieved his mission, but rode right round McClellan's rear to deliver his report to Lee at Richmond. In the next campaign he had the good fortune, in his raid against Gen. Pope's communications, not only to burn a great quantity of stores, but also to bring off the headquarters' staff document of the enemy, from which Lee was able to discover the strength and positions of his opponents in detail. Stuart, now a major-general and commander of the Cavalry Corps, was present at the second battle of Bull Run, and during the Maryland campaign he brilliantly defended one of the passes of South mountain (Crampton's gap), thus enabling Lee to concentrate his disseminated army in time to meet McClellan's attack. At Fredericksburg Stuart's cavalry were as usual in the flank of the army, and his horse, artillery rendered valuable service in checking Franklin's attack on "Stonewall" Jackson's Corps. At Chancellorsville Stuart was specially appointed by Lee to take over command of the II. Army Corps after Jackson had been wounded. The next campaign, Gettysburg, was preceded by the cavalry battle of Brandy station, in which for the first time the Federal Cavalry showed themselves worthy opponents for Stuart and his men. The march to the Potomac was screened by the Cavalry Corps, which held the various approaches on the right flank of the army, but at the crisis of the campaign Stuart was absent on a raid, and although he attempted to rejoin Lee during the battle, he was met and checked some miles from the field. Very shortly after the opening of the campaign of 1864 Stuart's corps was drawn away from Lee's army by the Union cavalry under Sheridan, and part of it was defeated at Yellow Tavern on May 10, and Stuart himself was killed.

See *Life* by H. B. McClellan (1885).

STUART, JOHN M'DUALL (1818–1866), South Australian explorer, was born at Dysart in Fifeshire, Scotland, in 1818, and arrived in the colony about 1839. He accompanied Captain Sturt's 1844–1845 expedition as draughtsman, and between 1858 and 1862 he made six expeditions into the interior, the last of which brought him on July 25 to the shores of the Indian Ocean at Van Diemen's Gulf, at the mouth of the Adelaide River. He died June 5, 1866.

STUBBS, WILLIAM (1825–1901), English historian and bishop of Oxford, son of William Morley Stubbs, solicitor, of Knaresborough, Yorkshire, was born on June 21, 1825, and was educated at the Ripon Grammar school and at Christ Church, Oxford, where he graduated in 1848, with a first class in classics and a third in mathematics. He was elected a fellow of Trinity college in the same year, was ordained priest in 1850, and held the college living of Navestock, Essex, from 1850 to 1866. In 1862 he was appointed librarian at Lambeth, and in 1866 regius professor of modern history at Oxford. He held this chair till 1884. Many of his lectures were published in book form, including *Seventeen Lectures on the Study of Mediaeval and Modern History, etc.* (1886, 3rd ed. 1900); *Lectures on European History* (1906); *Germany in the Early Middle Ages* (1908); and *Germany in the later Middle Ages* (1908). Stubbs aimed at the organization of a school of history in Oxford after the German model, but his lectures were thinly attended and he gave up the idea.

As a historian Stubbs was eminent alike in ecclesiastical history, as an editor of texts and as the historian of the English Constitution. In 1858 he published his *Registrum sacrum anglicanum*, which sets forth episcopal succession in England, and he edited with A. W. Haddan, vol. iii. of *Councils and Ecclesiastical Documents covering the History of the Anglo-Saxon Church* (1878). He edited for the Rolls series 19 volumes of editions of the chronicles, among the most notable of which are the *Gesta Regum* of William of Malmesbury (1867); the *Gesta regis Henrici II.* (1867); Roger Hoveden's *Chronica* (4 vols., 1868–71); the *Memorials of St. Dunstan* (1874); *The Historical Works of Ralph Diceto* (1878) and *The Historical Works of Gervase of Canterbury* (1879–90). The prefaces to these volumes contain some brilliant sketches of character.

His most famous work is his *Constitutional History of England* (3 vols., 1873, 75, 78, French trans. 1907), preceded by the *Select Charters, and other Illustrations of English Constitutional History from the Earliest Times to the Reign of Edward I.*, in 1870. The appearance of the *Constitutional History,* which traces the development of the English Constitution from the Teutonic invasions of Britain till 1485, is a landmark in the study of mediaeval English history, and has not been superseded.

In character Bishop Stubbs was modest, kind and sympathetic, ever ready to help and encourage serious students, generous in his judgment of the works of others, a most cheery companion, full of wit and humour. His wit was often used as a weapon of defence, for he did not suffer fools gladly. He died on April 22, 1901. In 1859 he had married Catherine, daughter of John Dollar, of Navestock, and had a numerous family.

See *Letters of William Stubbs, Bishop of Oxford*, edit. W. H. Hutton (1904).

STUCCO, a kind of plaster used for the covering of walls, or for decorative or ornamental features such as cornices, mouldings, etc., or for ceilings. The stucco used as an exterior covering for brick or stone work is coarse; a finer kind is used for decorative purposes. (*See* PLASTER-WORK.)

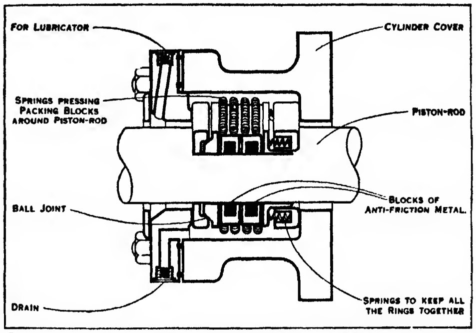
STUCLEY (or STUKELY), **THOMAS** (*c.* 1525–1578), English adventurer, son of Sir Hugh Stucley, of Affleton, near Ilfracombe, a knight of the body to King Henry VIII., was supposed to have been an illegitimate son of the king. He was a standard-bearer at Boulogne from 1547 to 1550, entered the service of the duke of Somerset, and after his master's arrest in 1551 a warrant was issued against him, but he escaped to France, and served in the French army. He was sent by Montmorency with a letter of recommendation from Henry II. of France to Edward VI On his arrival he proceeded on Sept. 16, 1552 to reveal the French plans for the capture of Calais and for a descent upon England, which had, according to his account, been the object of his mission to England Stucley was imprisoned in the Tower for some months A prosecution for debt on his release in August 1553 compelled him to become a soldier of fortune once more, but he returned to England in December 1554 in the train of Philibert, duke of Savoy He married an heiress, Anne Curtis, but in a few months had to return to the duke of Savoy's service. From 1558 onwards he seems to have been engaged in buccaneering, and although Elizabeth was compelled to disavow Stucley, who surrendered in 1565, his prosecution was merely formal.

Stucley was then engaged by Sir Henry Sidney in Ireland, then by Fénelon, the French Ambassador in London, and then by Philip II. of Spain, but he fell into disgrace at Madrid. But he commanded three galleys, under Don John of Austria at the battle of Lepanto, and exploits restored him to favour at Madrid On March 2, 1572 he was at Seville, offering to hold the narrow seas against the English with a fleet of twenty ships. In four years (1570–1574) he is said to have received over 27,000 ducats from Philip II Wearied by the Spanish king's delays he sought assistance from Gregory XIII, who aspired to make his illegitimate son, Giacomo Buoncompagno, king of Ireland. He set sail from Civita Vecchia in March 1578, but put into Lisbon, where he was to meet his confederate, James Fitzmaurice Fitzgerald, and to secure better ships before sailing for Ireland. There he was turned from his purpose by King Sebastian, with whom he sailed for Morocco. He commanded the centre in the battle of Alcazar on Aug. 4, 1578, and was killed

There is a detailed biography of Stucley, based chiefly on the English, Venetian and Spanish state papers, in R Simpson's edition of the 1605 play (*School of Shakespeare,* 1878, vol i), where the Stucley ballads are also printed

STUDEBAKER CORPORATION, THE, incorporated Feb. 14, 1911, at that time acquiring the assets of the Studebaker Brothers Manufacturing Company, formed in 1868, and the Everitt-Metzger-Flanders Company, organized in 1908 The Studebaker Brothers Manufacturing Company succeeded the firm of H. and C. Studebaker, established in 1852. Beginning with net assets of $23,000,000 in 1911, the corporation has increased its assets as at June 30, 1928, to $105,000,000. Capital stock outstanding 1928: preferred $7,305,000, $100 par value; common $75,000,000, no par value. (H. E. DA.)

STUFFING-BOX is a device to prevent leakage by a piston or ram or spindle as it passes into a cylinder sustaining pressure. This applies to steam-engines, air-compressors, some kinds of pumps, hydraulic machinery, many stop-valves, throttle-valves, and water fittings The main element in each instance is the gland, which is forced along by a thread, or by two or more screws pressing its flange. A chamber surrounding the rod or spindle contains the stuffing or packing, and this becomes compressed around the rod to form a non-leaking joint. Big glands have the nuts of the bolts driven in unison by a gear to produce equable tightening all around the circle. A packing commonly used is hemp, though to withstand heat asbestos mixtures are chiefly employed, and are charged with graphite so as to give a constant lubricating effect. Metallic packings have largely superseded any kind of fabrics, the stuffing-box containing an arrangement of white-metal pads, with springs to compress them around the rod; the steam pressure further assists in making a tight joint. The drawing shows the Lancaster and Tonge packing, in which the encircling springs can be unhooked and twisted to tighten the grip.



SECTION OF LANCASTER STUFFING-BOX SHOWING METALLIC PACKING WHICH PRESSES ANTI-FRICTION BLOCKS AROUND THE PISTON-ROD AND PREVENTS THE ESCAPE OF STEAM

STUFFINGS OR FORCEMEATS. These are used principally to give extra flavour to certain flesh foods and vegetables; to bring out the flavour of others, and as additions to some dish such as jugged hare, in the form of forcemeat balls or quenelles. Bread, crumpled, moistened and seasoned, is the foundation of many forcemeats. A simple American formula is 2 cups dry bread crumbs to ½ cup hot water, ½ teaspoon salt, ¼ teaspoon pepper, sometimes varied by the substitution of milk or stock (especially chicken stock) for water A plain English recipe calls for 4 oz. bread scraps to half the amount of suet, one egg, salt, pepper and some form of seasoning, *e g.*, parsley or mixed herbs. Either recipe may be elaborated by adding chopped onion, sage, nutmeg or ground nuts. Chestnut, mushroom, oyster and potato forcemeats are good for poultry, minced giblets being often added. Fruit stuffings are especially good for strong-flavoured birds like duck and goose.

STUKELEY, WILLIAM (1687–1765), English antiquary, was born at Holbeach, Lincolnshire, on Nov. 7, 1687 His principal work, an elaborate account of Stonehenge, appeared in 1740, and he wrote copiously on other supposed Druid remains, becoming familiarly known as the "Arch-Druid." He died in London on March 3, 1765.

STUMPF, CARL (1848–), German psychologist and philosopher, was born at Wiesentheid, Bavaria, April 21, 1848. He studied first at Würzburg under Brentano, and later at Gottingen under Lotze. He was greatly influenced in his philosophy and psychology by these two men, and has remained loyal to them. He was appointed to the chair of philosophy at Wurzburg (1873), Prague (1879), Halle (1884), Munich (1889) and finally Berlin (1894) where he was professor of philosophy and director of the psychological laboratory In 1900 he founded the phonogram-archivs, which consist of a collection of phonograph records of primitive music. In 1907–8 he was rector of Berlin university. In 1921 he reached the age limit, and retired from active teaching.

His chief publications include: *Ueber den psychologischen Ursprung der Raumvorstellung* (1873); *Tonpsychologie* (1883–90); "Ueber den Begriff der mathematischen Wahrscheinlichkeit," *Sitz. bayr. Ak.* (1892); *Ueber Leib und Seele* (1897); *Beiträge zur Akustik und Musikwissenschaft* (1898–1924); "Ueber den Begriff der Gemütsbewegung," *Z. f. Psychol.* (1899); "Erscheinungen und psychische Funktionen," *Abh. pr. Ak.* (1906); "Zur Einteilung der Wissenschaften," *Abh. pr. Ak.* (1906); "Ueber Gefuhlsempfindungen," *Z f. Psychol.* (1907); *Die Wiedergeburt der Philosophie* (1908); *Philosophische Reden und Vorträge* (1910); *Die Anfänge der Musik* (1911); "Apologie der Gefühlsempfindungen," *Z. f. Psychol.* (1916); "Die Struktur der Vokale," *Sitz. pr. Ak.* (1918); *Die Sprachlaute: experimentellphonetische Untersuchungen* (1926). *See* also B. Rand, *The Classical Psychologists* (1912); and Stumpf's autobiography in R. Schmidt, *Die Philosophie der Gegenwart in Selbstdarstellungen* (1924).

(H. S. L.)

STUMPF, JOHANN (1500–1576), writer on Swiss history and topography, was born at Bruchsal (near Carlsruhe) in 1500 and died at Zürich in 1576. He studied theology at Strasbourg and Heidelberg, and in 1522 was ordained priest at Basel and assigned to the parish of Bubikon (in Canton Zürich). He soon, however, adopted the Protestant faith, and he remained at Bubikon (most of his parishioners following him) as Protestant pastor till 1543. Thereafter he removed to Stammheim, but retired in 1561 and spent the rest of his days at Zürich. The chief result of his historical studies and travels was his *Gemeiner loblicher Eydgnossenschaft Stetten, Landen, und Volckeren Chronikwirdiger Thaaten Beschreybung* (1548). He also wrote on the Council of Constance (1541) and on the emperor Henry IV. (1556).

STUPA, in architecture, a specific type of Buddhist religious building, consisting of a solid mass of masonry, built above a receptacle containing a sacred relic. In India it is commonly called a tope (*q.v.*). Although the origin of the stupa was probably the more primitive tumulus, or mound of earth over a grave, its development in historic times was toward greater and greater height and richness of treatment. Outside of Tibet and China, a profile generally conical and of great height was developed, as in the famous gilded example in the centre of the Shwe Dagon, in Rangoon. The Tibetan form, developed to a great degree of beauty and richness in China, has a bulbous silhouette, wider near the top than at the bottom.

STURDEE, SIR FREDERICK CHARLES DOVETON (1859–1925), British sailor, was born at Charlton, Kent, on June 9, 1859, and entered the navy in 1871. He was promoted lieutenant (1880), commander (1893), captain (1899), rear-admiral (1908), vice-admiral (1913), admiral (1917) and admiral of the fleet (1921). He saw service in Egypt (1882) and in Samoa (1899), when he was in command of the Anglo-American force. He was assistant director of naval intelligence to the Admiralty (1900–02) and chief of staff, Mediterranean Fleet (1905–07) and Channel Fleet (1907). In 1910 he became rear-admiral of the first battle squadron, and commanded the 2nd cruiser squadron (1912–13). During the World War Sturdee was made chief of the war staff in Nov. 1914. As commander-in-chief in the south Atlantic and Pacific, he led the squadron which won the battle of the Falkland islands (Dec. 8, 1914), and he was in command of the 4th battle squadron when it took part in the battle of Jutland. He was created K.C.B. in 1913, K.C.M.G. in 1916, and a baronetcy was conferred on him in 1916, with the title "of the Falkland islands." From 1918–21 he was commander-in-chief at the Nore. He died on May 7, 1925.

STURDZA or STURZA, the name of an ancient Rumanian family, of unknown origin, which probably came from Trebizond and settled in Moldavia. The Sturdza family has been long and intimately associated with the Government first of Moldavia and afterwards of Rumania. Its members belong to two main divisions, which trace their descent respectively from John (Ioan) or from Alexander (Sandu), the sons of Kirak Sturdza, who lived in the 17th century, the founder of the family.

1. To the first division belongs MICHAEL [Michail] STURDZA (1795–1884), prince of Moldavia from 1834 to 1849. A man of liberal education, he established the first high school, a kind of university, in Jassy. He brought scholars from foreign countries to act as teachers, and gave a very powerful stimulus to the educational development of the country. In 1844 he decreed the emancipation of the gypsies. Until then the gypsies had been treated as slaves and owned by the Church or by private landowners; they had been bought and sold in the open market. Michael Sturdza also attempted the secularization of monastic establishments, which was carried out by Prince Cuza in 1864, and the utilization of their endowments for national purposes. Under his rule the internal development of Moldavia made immense progress; roads were built, industry developed, and Michael is still gratefully remembered by the people.

See *Michel Stourdza et son administration* (Brussels, 1834); *Michel Stourdza, ancien prince regnant de Moldavie* (1874); A. A. C. Sturdza, *Règne de Michel Sturdza, prince de Moldavie 1834–1849* (1907).

2. GREGORY [Grigorie] STURDZA (1821–1901), son of the above, was educated in France and Germany, became a general in the Ottoman army under the name of Muklis Pasha, and afterwards attained the same rank in the Moldavian army. He was a candidate for the Moldavian throne in 1859, and subsequently a prominent member of the Russophil party in the Rumanian parliament. He wrote *Lois fondamentales de l'univers* (Paris 1891).

3. JOHN [Ioan] STURDZA, prince of Moldavia (1822–1828), was the most famous descendant of Alexander Sturdza. Immediately after the Greek revolution, Prince John Sturdza took an active part in subduing the roving bands of Greek Hetairists in Moldavia; he transformed the Greek elementary schools into Rumanian schools and laid the foundation for that scientific national development which Prince Michael Sturdza continued after 1834. In 1828 the Russians entered the country and took Prince John prisoner. He died in exile.

4. DEMETRIUS [Dimitrie] STURDZA (1833–1914), Rumanian statesman, was born in 1833 at Jassy, and educated there at the Academia Michaileana. He continued his studies in Germany, took part in the political movements of the time, and was private secretary to Prince Cuza. Demetrius afterwards turned against Cuza, joined John Bratianu, and became a member of the so-called Liberal Government. In 1899 he was elected leader of the party in succession to Bratianu and was four times prime minister. He died at Bucharest on Oct. 21, 1914. (M. G.)

STURE, STEN, commonly called the Younger (1492–1520), succeeded his father Srante (d. 1512) as regent of Sweden. His regency was wrecked by the feud between the Sture and Trolle families, and his own personal feud with Gustaf Trolle, who invoked the aid of Christian II. of Denmark. The war with Denmark was begun in 1516 and resumed in 1518, and in 1520 culminated in the battle near Börgerund on Lake Aarunden (Jan. 19). At the very beginning Sture was hit by a bullet and his peasant levies fled to the wild mountainous regions of Tiveden where they made a last desperate but unsuccessful stand. The mortally-wounded regent took to his sledge and posted towards Stockholm, but expired on the ice of Lake Mälar two days later.

STURGE, JOSEPH (1793–1859), English philanthropist and politician, was the son of a farmer in Gloucestershire, and settled in 1822 in Birmingham, where he died on May 14, 1859. His life was given to agitation for the abolition of slavery, then to the betterment of the conditions of the liberated slaves, and lastly to the cause of peace and arbitration. He was one of the founders in 1855 of the *Morning Star*, a paper established in the peace interest; a Quaker; and a friend of the Chartists.

See Henry Richard, *Memoirs of Joseph Sturge* (London, 1864); John (Viscount) Morley, *Life of Richard Cobden* (London, 1881).

STURGEON (*Acipenser*), a small group of fishes, of which some 20 species are known, from European, Asiatic and North American rivers. The distinguishing characters of this group are dealt with in the article FISH. Most of them pass a great part of the year in the sea, but periodically ascend large rivers, some in spring to deposit their spawn, others later in the season for some purpose unknown; a few are confined to fresh water. None occur in the tropics or the southern hemisphere. By a decree of Edward II., English sturgeons are the property of the king.

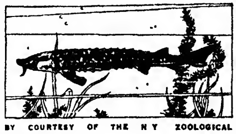
Sturgeons are found in the greatest abundance in the rivers of southern Russia, more than 10,000 fish being sometimes caught at a single fishing-station in the fortnight of the up-stream migration, and in the fresh waters of North America. In Russia the fisheries are of immense value. Early in summer the fish migrate into the rivers or towards the shores of fresh-water lakes in large shoals for breeding purposes. The ova are small and numerous. The growth of the young is rapid. After the sturgeon attains maturity, growth continues for some years, but slowly. Some attain great age, and von Baer stated that observations made in Russia indicate that the Hausen (*A. huso*) may attain an age of between 200 and 300 years. Sturgeons ranging from 8 to 11 ft. in length are by no means scarce, and some species grow to a much larger size. Sturgeons are ground-feeders. The more important species are:

1. The common sturgeon of Europe (*A. sturio*) occurs on all

the coasts of Europe, but is absent from the Black sea It is not rare on the coasts of North America. It reaches a length of 12 ft., but is always caught singly, or in pairs. The form of its snout varies with age (as in the other species), being much more blunt and abbreviated in old than in young examples. There are 11–13 bony shields along the back and 29–31 along the body

2 *A guldenstadtii* is one of the most valuable species of the rivers of Russia; it inhabits the Siberian rivers also, eastwards as far as Lake Baikal. It attains the same size as the common sturgeon, and abounds in the rivers of the Black and Caspian seas.

3 *A stellatus* occurs in abundance in the rivers of the Black sea and of the Sea of Azov. It has a long and pointed snout, like the sterlet, but simple barbels without fringes Though growing only to about half the size of the preceding species it is of no less value, its flesh being more highly esteemed and its caviare and isinglass fetching a higher price.



BY COURTESY OF THE N Y ZOOLOGICAL SOCIETY

THE COMMON STURGEON (ACIPENSER STURIO)

4 The sturgeon of the great lakes of North America (*A. rubicundus*) has been made the object of a large industry at various places on Lakes Michigan and Erie The sturgeons of the lakes are unable to migrate to the sea, but those below the Falls of Niagara are great wanderers.

5. *A. huso* is recognized by the absence of osseous scutes on the snout and by its flattened, tape-like barbels It is one of the largest species, reaching the length of 24 ft., and a weight of 2,000lb. It inhabits the Caspian and Black seas, and the Sea of Azov Its flesh, caviare and air-bladder are of less value than those of the smaller kinds

6 The sterlet (*A. ruthenus*) is one of the smaller species, which inhabits both the Black and Caspian seas

The family *Acipenseridae* includes one other genus, *Scaphirhynchus*, the shovel-head or shovel-nosed sturgeon, distinguished by the long, broad and flat snout, the suppression of the spiracles, and the union of the longitudinal rows of scales posteriorly. All the species are confined to fresh water One of them is common in the Mississippi and other rivers of North America, the other three occur in the larger rivers of eastern Asia.

STURGEON BAY, a city of north-eastern Wisconsin, U S A, on the narrow peninsula (here 8 m. wide) between Green bay and the main body of Lake Michigan; a port of entry and the county seat of Door county. It lies on Sturgeon bay (an inlet of Green bay, connected with Lake Michigan by a ship-canal) and is served by the Green Bay and Western Railroad and lake steamers Pop. 4,553 in 1920 (87% native white). The peninsula is a region of great natural beauty, with many hotels and summer homes. The city is a summer resort and trading centre. The annual cherry crop amounts to over 10,000,000 bushels. Commercial fishing is an important industry. There is a State fish hatchery near by. The city was incorporated in 1883.

STURGIS, RUSSELL (1836–1909), American architect and art critic, was born in Baltimore county, Maryland, on Oct 16, 1836 He graduated from the Free Academy in New York (now the College of the City of New York) in 1856. He studied architecture under Leopold Eidlitz and then for two years in Munich. In 1862 he returned to the United States. He designed the Yale University chapel and the Farnham and Durfee dormitories at Yale, the Flower Hospital, New York, the Farmers' and Mechanics' Bank, Albany, and many other buildings After 1880 he did comparatively little professional work He was in Europe in 1880–84 For a short time after his return he was secretary of the New York municipal civil service board He was president of the Architectural League of New York in 1889–93, was first president of the Fine Arts Federation in 1895–97, and was a member of the National Society of Mural Painters, the National Sculpture Society, the National Academy of Design, and the New York chapter of the American Institute of Architects. He lectured on art at Columbia University, the Metropolitan Museum of Art in New York, the Peabody Institute of Baltimore and the Art Institute of Chicago. He edited *A Dictionary of Architecture and Building* (3 vols., 1901–02) and the English version of Wilhelm Luebke's *Outlines of the History of Art* (2 vols, 1904), and he wrote *European Architecture* (1896), *How to Judge Architecture* (1903), *The Appreciation of Sculpture* (1904), *The Appreciation of Pictures* (1905), *A Study of the Artist's Way of Working in the Various Handicrafts and Arts of Design* (2 vols., 1905) and an unfinished *History of Architecture* (1906 et seq.). During his last years he was nearly blind He died in New York Feb 11, 1909.

STURGIS, a city of Michigan, U S.A. The population was 5,995 in 1920 (95% native white). It is in a rich agricultural region, and has a large number of diversified manufacturing industries. The city has a commission-management

STÜRGKH, CARL, COUNT (1859–1916), Austrian politician, was born at Graz on Oct 30, 1859, of an ancient Styrian family. In 1891, he entered the Reichsrat as representative of the constitutional landed proprietors, achieving some prominence as a keen opponent of universal suffrage He was from Feb 10, 1909 to Nov. 3, 1911 minister of education, and a zealous advocate of the humanistic education traditional in the *gymnasia* On Nov 3 he became prime minister, and formed a cabinet without regard to nationality Owing to the incessant parliamentary obstruction, however, Stürgkh prorogued parliament indefinitely on March 16, 1914, with an announcement that "Parliaments were only means to an end, and where they failed, other means must be employed." So on the outbreak of the World War Austria was without a parliament, and the decisions lay with its few rulers alone Sturgkh was one of the committee of five ministers who decided on the ultimatum to Serbia He refused to convoke parliament, and it was as a protest against this that the Social Democrat, Friedrich Adler (*q v.*) assassinated him in a Viennese restaurant on Oct 21, 1916 (*see* AUSTRIA).

STURM, JACQUES CHARLES FRANÇOIS (1803–1855), French mathematician, of German extraction, was born at Geneva on Sept. 29, 1803, and spent most of his life in Paris In 1829 he discovered the theorem regarding the determination of the number of real roots of a numerical equation included between given limits, which bears his name (*See* EQUATION) He was chosen a member of the Académie des Sciences in 1836, became professor in the École Polytechnique in 1840, and finally succeeded Poisson in the chair of mechanics in the Faculté des Sciences in Paris. He died in Paris on Dec 18, 1855

His works, *Cours d'analyse de l'école polytechnique* (1857–68) and *Cours de Mécanique de l'école polytechnique* (1861), were published posthumously.

STÜRMER, BORIS VLADIMIROVICH (1849–1917), Russian politician, was of German origin. His father was captain of a fire brigade at Tula He studied at the University of St. Petersburg (Leningrad). He started his career in the chamberlain's department of the imperial court. When in 1892 the Government rejected the candidate nominated to the presidency of the executive board of the Tver zemstvo, Sturmer, whose name was on the list of the Tver gentry, was appointed to this office It was the first case of a president being appointed instead of elected In 1894 Sturmer was appointed governor of the Novgorod, and later of the Yaroslavl province. In Jan. 1916, he was made prime minister. He was opposed in liberal and patriotic circles. Accusations of connections with Germany were brought to the Duma by Milyukov and resulted in Stürmer's resignation in Nov. 1916 After Sazonov's dismissal Stürmer took the portfolio of foreign affairs He was arrested after the revolution, and died in prison in Sept. 1917

STURM VON STURMECK, JACOB (1489–1553), German statesman and reformer, was born at Strasbourg on Aug. 10, 1489. He was educated at the universities of Heidelberg and Freiburg, and about 1517 he entered the service of Henry of Wittelsbach, provost of Strasbourg (d. 1552). He soon became an adherent of the reformed doctrines, and a member of the town council in 1524 He was responsible for the policy of Strasbourg during the Peasants' War; represented the city at the diet of Speyer in 1526 and at subsequent diets. He took part in the con-

ference at Marburg in 1529; but when the attempts to close the breach between Lutherans and Zwinglians failed, he presented the *Confessio tetrapolitana* to the Augsburg diet of 1530. As the representative of Strasbourg Sturm signed the "protest" which was presented to the diet of Spires in 1529, being thus one of the original "Protestants." Owing largely to his influence Strasbourg joined the league of Schmalkalden in 1531. In Feb. 1547 the citizens were compelled to submit to Charles V. Sturm obtained for his native city some modification of the *Interim* issued from Augsburg in May 1548. He died at Strasbourg on Oct. 30, 1553.

See H. Baumgarten, *Jakob Sturm* (Strasbourg, 1876); A. Baum, *Magistrat und Reformation in Strassburg bis 1529* (Strasbourg, 1887).

STURNIDAE: *see* STARLING.

ŠTURSA, JAN (1880–1925), the leader of the modern school of Czech sculpture, was born at Nové Město in Moravia. In 1899 he entered the Academy of Fine Arts at Prague as a pupil of Myslbek. His early works manifest the influence of the symbolic literature of that period, but by 1905–7 he had already attained an individual expression in such works as "Puberty" (1905), "The Melancholy Girl" (1906) and "Primavera" (1907). A journey to Italy in 1907 was the opening of a new epoch in his creative work. His admiration for femininity is manifested in "Eve" (1908, State Gallery, Munich), "Hetaira" (1909), "Messalina" and the monumental representation of the dancer "Sulamith Rahu" (1911), now in the gallery at Venice. He interpreted the opposite feminine type of intellectuality in the monument to Hana Kvapilova (1912), the Czech actress. During the same period Štursa produced the group of statuary for the pylons of the Hlavka Bridge at Prague. In 1916 he was appointed professor at the Academy of Fine Arts in Prague, and in this period of his artistic maturity he created the "Wounded Man." He produced a number of portrait busts, the most noteworthy being "President Masaryk." He died in Prague on April 28, 1925.

STURT, CHARLES (d. 1869), English explorer, was born in England. Having landed in Australia with his regiment (the 39th), he started on a first expedition (1828) discovering the Darling river; while a second made known the existence of Lake Alexandrina. From his third journey (1844–1845), in which terrible hardships had to be endured, he returned quite blind, and he never altogether recovered his sight. He was appointed surveyor-general of South Australia in 1833, and subsequently chief secretary until 1856 when responsible government was introduced. Sturt died at Cheltenham, England, on June 16, 1869.

STURZO, LUIGI (1870–), Italian priest and political organizer. Born at Caltagirone, Sicily, on Nov. 26, 1870, he showed ability in creating diocesan committees, co-operation unions, etc., and guiding the masses in the direction of Christian democracy. On the outbreak of the World War, he came to Rome as secretary of the Azione cattolica. After the armistice he was chosen political secretary of the *Partito Popolare italiano,* founded early in 1919. The general tendency of the party was Christian Socialist, and Don Sturzo advocated social reforms of a radical nature, especially in agriculture, as the majority of the party's adherents were peasants; unlike the Socialists, he demanded the expropriation of the land with compensation for the landlords at the expense of the taxpayers, collaboration of capital and labour and a patriotic foreign policy; an extremist wing was led by Sig. Miglioli.

At the elections of Nov. 1919, the *Partito Popolare* secured 101 seats, and became a dominant force in Italian politics. When Sig. Bonomi was trying to form a cabinet after the fall of Giolitti in Feb. 1922, it was Don Sturzo who dictated its composition. In the early days of Fascism Don Sturzo did not oppose it, although there were frequent affrays between the black-shirted *squadre* and the Migliolini. After the march on Rome he allowed several Popolari to enter the cabinet, but his half-hearted support of the Mussolini Government resulted in their withdrawal, and Don Sturzo and his party definitely joined the opposition. A section of the party broke away and constituted the *Centro nazionale cattolico.* The Vatican issued an admonition to priests not to mix in party politics and hinted that he would be well advised to leave Italy. He consequently went to England and France. In 1925 he published *Pensiero antifascista,* and in 1927 *Italy and Fascism* in English. (L. V.)

STUTTGART, capital of Württemberg. Pop. including suburbs (1925) 337,199. Stuttgart seems to have originated in a stud (*Stuten Garten*) of the early counts of Württemberg, and is first mentioned in a document of 1229. In the early history of Württemberg it was overshadowed by Cannstatt. Indeed, even at the beginning of the 19th century it did not contain 20,000 inhabitants, and its real advance began with Kings Frederick and William I. Few of its principal buildings are older than the 19th century. They illustrate the revival of the Renaissance style. Of the churches in the city the most interesting are the Stiftskirche, with two towers, a fine specimen of 15th-century Gothic; the Leonhardskirche, also a Gothic building of the 15th century; and the Hospitalkirche, restored in 1841, the cloisters of which contain the tomb of Johann Reuchlin. A large proportion of the most prominent buildings are clustered round the Schlossplatz. Among these are the new palace, a structure of the 18th century, finished in 1807; the old palace, a 16th-century building; and the so-called Akademie, formerly the seat of the Karlschule, where Schiller received part of his education, and now containing a library. On or near the Schlossplatz also are the new courts of justice; and the central railway station.

The art collections of Stuttgart are numerous and valuable. The museum of art comprises a picture gallery, a collection of casts of Thorvaldsen's works and a cabinet of engravings. The library contains many thousands of printed volumes and manuscripts, including one of the largest collections of Bibles in the world. The technical high school, which since 1899 has possessed the right to confer the degree of doctor of engineering, practically enjoys academic status and so does the veterinary high school.

Stuttgart is the centre of the publishing trade of south Germany. Its other manufactures include machinery, pianos and other musical instruments, cotton goods, linen, gloves, rubber, jewellery, chocolate, lamps, cigars, furniture, leather, paper, colours and chemicals. A large banking and exchange business is done here. Stuttgart contains a garrison. Cannstatt, incorporated with Stuttgart in 1903, attracts visitors owing to its beautiful situation and its saline and chalybeate springs.

STUYVESANT, PETER (1592–1672), Dutch colonial governor, was born in Scherpenzeel, in Southern Friesland, in 1592. He studied at Franeker, entered the military service in the West Indies about 1625, and was director of the West India Company's colony of Curaçao 1634–44. In April, 1644 he attacked the Portuguese island of Saint Martin and was wounded; he had to return to Holland, and there one of his legs was amputated. Thereafter he wore a wooden leg ornamented with silver bands. In May, 1645, he was selected by the West India Company to supersede William Kieft as director of New Netherland. He arrived in New Amsterdam (later New York) on May 11, 1647, and was received with great enthusiasm. In response to the demand for self-government, in Sept., 1647, he and the council appointed—after the manner then followed in Holland—from 18 representatives chosen by the people a board of 9 to confer with him and the council whenever he thought it expedient to ask their advice.

The leading burghers were, however, soon alienated by his violent and despotic methods, by his defence of Kieft, and by his devotion to the interests of the company; the nine men became the centre of municipal discontent, and a bitter quarrel ensued. In 1650 the states-general suggested a representative government to go into effect in 1653, but the company opposed it; in 1653, however, there was established the first municipal government for the city of New Amsterdam modelled after that of the cities of Holland. Stuyvesant also aroused opposition through his efforts to increase the revenues of the company, to improve the system of defence, and to prevent the sale of liquor and firearms to the Indians, and through his persecution of Lutherans and Quakers, to which the company finally put an end. In 1650, he came to an agreement with the commissioners of the united colonies of New England at Hartford upon the boundary between New Netherland and Connecticut, involving the sacrifice of a large amount of territory. On Long Island, during Stuyvesant's rule, Dutch in-

fluence was gradually undermined by John Underhill Stuyvesant's dealings with the Swedes were more successful. With a force of 700 men he sailed into the Delaware in 1655, captured Ft. Casimir (Newcastle)—which Stuyvesant had built in 1651 and which the Swedes had taken in 1654—and overthrew the Swedish authority in that region He also vigorously suppressed Indian uprisings in 1655, 1658 and 1663.

In March, 1664, Charles II. granted to his brother, the duke of York, the territory between the Connecticut river and Delaware bay, and Col. Richard Nicolls with a fleet of 4 ships and about 300 or 400 men was sent out to take possession. Misled by instructions from Holland that the expedition was directed wholly against New England, Stuyvesant made no preparation for defence until just before the fleet arrived As the burghers refused to support him, Stuyvesant was compelled to surrender the town and fort on Sept. 8. He returned to Holland in 1665 and was made a scapegoat by the West India Company for all its failings in New Amsterdam; he went back to New York again after the treaty of Breda in 1667, having secured the right of free trade between Holland and New York. He spent the remainder of his life on his farm called the Bouwerie, from which the present "Bowery" in New York city takes its name. He died in Feb. 1672, and was buried in a chapel, on the site of which in 1799 was erected St. Mark's church.

See Bayard Tuckerman, ***Peter Stuyvesant*** (1893), in the "Makers of America" Series, and Mrs. Schuyler Van Rensselaer, ***History of the City of New York in the Seventeenth Century*** (1909).

STYLE. It is desirable to insist at the outset on the dangers of a heresy which found audacious expression towards the close of the 19th century, namely, that style is superior to thought and independent of it. Against this may be set at once one of the splendid apophthegms of Buffon, "Les idées seules forment le fond du style" Before there can be style there must be thought, clearness of knowledge, precise experience, sanity of reasoning power. A confusion between form and matter has often confused this branch of our theme. Even Flaubert, than whom no man ever gave closer attention to the question of style, seems to dislocate them For him the *form* was the work itself: "As in living creatures, the blood, nourishing the body, determines its very contour and external aspect, just so the *matter,* the basis, of a work of art imposes, necessarily, the unique, the just expression, the measure, the rhythm, the *form* in all its characteristics" This ingenious definition seems to strain language beyond its natural limits. If the adventures of an ordinary young man in Paris be the *matter* of *L'Education sentimentale* it is not easy to admit that they "imposed, necessarily," such a "unique" treatment of them as Flaubert so superlatively gave They might have been recounted with feebler rhythm by an inferior novelist, with bad rhythm by a bad novelist and with no rhythm at all by a police-news reporter What makes that book a masterpiece is not the basis of adventure, but the superstructure of expression The expression, however, could not have been built up on no basis at all, and would have fallen short of Flaubert's aim if it had risen on an inadequate basis The perfect union is that between adequate matter and an adequate form. We will borrow from the history of English literature an example which may serve to illuminate this point Locke has no appreciable style; he has only thoughts Berkeley has thoughts which are as valuable as those of Locke, and he has an exquisite style as well. From the artist's point of view, therefore, we are justified in giving the higher place to Berkeley, but in doing this we must not deny the importance of Locke. If we compare him with some pseudo-philosopher, whose style is highly ornamental but whose thoughts are valueless, we see that Locke greatly prevails. Yet we need not pretend that he rises to an equal height with Berkeley, in whom the basis is no less solid, and where the superstructure of style adds an emotional and aesthetic importance to which Locke's plain speech is a stranger. At the same time, an abstract style, such as that of Pascal, may often give extreme pleasure, in spite of its absence of ornament, by its precise and pure definition of ideas and by the just mental impression it supplies of its writer's power and placidity of mind. But whether in the abstract or concrete style, what Rossetti called "fundamental brain-work" must always have a leading place.

When full justice has been done to the necessity of thought as the basis of style, it remains true that what is visible, so to speak, to the naked eye, what can be analysed and described, is an artistic arrangement of words. Language is so used as to awaken impressions, and these are roused in a way peculiar to the genius of the individual who brings them forth. The personal aspect of style is therefore indispensable, and is not to be ignored even by those who are most rigid in their objection to mere ornament. Ornament in itself is no more style than facts, as such, are thought. In an excellent style there is an effect upon our senses of the mental force of the man who employs it D'Alembert said of Fontenelle that he had the style of his thought, like all good authors. In the words of Schopenhauer, style is the physiognomy of the soul: in the Renaissance phrase, it is *mentis character* All these attempts at epigrammatic definition tend to show the sense that language ought to be, and even unconsciously is, the mental picture of the man who writes

To attain this, however, the writer must be sincere, original and highly trained He must be highly trained, because, without the exercise of clearness of knowledge, precise experience and the habit of expression, he will not be able to produce his soul in language Nor can anyone who desires to write consistently and well, afford to neglect the laborious discipline which excellence entails He must never rest until he has attained a consummate adaptation of his language to his subject, of his words to his emotion This is the most difficult aim which the writer can put before him. Perfection is impossible, and yet he must never desist from pursuing perfection.

> "If all the pens that ever poets held
> Had fed the feeling of their masters' thoughts,
> And every sweetness that inspired their hearts,
> Their minds, and muses, on admirèd themes—
> If all the heavenly quintessence they 'still
> From their immortal flowers of poesy,
> Wherein, as in a mirror, we perceive
> The highest reaches of a human wit—
> If these had made one poem's period,
> And all combined in beauty's worthiness,
> Yet should there hover in their restless heads
> One thought, one grace, one wonder, at the least
> Which into words no virtue can digest"
> —Marlowe, *Tamburlaine the Great.*

Flaubert believed that every thought or grace or wonder had one word or phrase exactly adapted to express it, and could be "digested" by no other without loss of clearness and beauty It was the passion of his life, and the despair of it, to search for this unique phrase in each individual case Perhaps in this research after style he went too far, losing something of that simplicity and inevitability which is the charm of natural writing The greatest writing is that which in its magnificent spontaneity carries the reader with it in its flight; that which detains him to admire itself can never rise above the second place Forgetfulness of self, absence of conceit and affectation, simplicity in the sense not of thinness or poorness but of genuineness—these are elements essential to the cultivation of a noble style. Here again, thought must be the basis, not vanity or the desire to astonish. We do not escape by our ingenuities from the firm principle of Horace, "scribendi recte sapere est et principium et fons."

Of the errors of style which are the consequences of bad taste, it is difficult to speak except in an entirely empirical spirit, because of the absence of any absolute standard of beauty by which artistic products can be judged. That kind of writing which in its own age is extravagantly cultivated and admired may, in the next age, be as violently repudiated; this does not preclude the possibility of its recovering critical if not popular favour. Perhaps the most remarkable instance of this is the revolt against Ciceronian prose which occurred almost simultaneously in several nations toward the middle of the 16th century and in England is best represented by Lyly in his celebrated *Euphues.* Montaigne in France and Castiglione in Italy, by their easiness and brightness, their use of vivid imagery and their graceful illumination, marked the universal revulsion against the Ciceronian stiffness. Each of these new manners of writing fell almost immediately into desue-

tude, and the precise and classic mode of writing in another form came into vogue (Addison, Bossuet, Vico, Johnson). In the 19th century admiration of the ornamental writers of the 16th and 17th centuries revived. A facility in bringing up before the memory incessant analogous metaphors is the property, not merely of certain men, but of certain ages; it flourished in the age of Marino and was welcomed again in that of Meredith. A vivid, concrete style, full of colour and images, is not to be condemned because it is not an abstract style, scholastic and systematic. It is to be judged on its own merits and by its own laws. It may be good or bad; it is not bad merely because it is metaphorical and ornate. The amazing errors which lie strewn along the shore of criticism bear witness to the lack of sympathy which has not perceived this axiom and has wrecked the credit of dogmatists. Yet that particular species of affectation which encourages untruth, affectation, parade for the mere purpose of producing an effect, must be wrong, even though Cicero be guilty of it.

See Walter Pater, *An Essay on Style* (1889); Walter Raleigh, *Style* (1897); Antoine Albalat, *La Formation du style par l'assimilation des auteurs* (1901) and *Le Travail du Style* (1904); Remy de Gourmont, *Le Problème du style* (1902); J. Middleton Murry, *The Problem of Style* (1922); H. W. Fowler, *A Dictionary of Modern English Usage* (1926). (E. G.; X.)

For style in architecture, etc., *see* PERIODS OF ART.

STYLOBATE, in architecture, the upper step of a Greek temple on which the columns rest; also applied to all three steps.

STYLOPS, the name of a genus of insects belonging to the order Strepsiptera allied to the beetles. The order is distributed over most parts of the world, but numbers less than 200 species. The males are minute, black or brown insects with branched antennae and vestigial mouth-parts: the fore wings are reduced to club-like scales but the hind wings are large and fan-like. They are seldom seen and lead a very brief life. The females are degenerate sac-like parasites that live partly protruding from the bodies of certain bees, wasps or leafhoppers and their allies. The young larvae are very minute and known as triungulins which hatch within the parent and probably escape on to flowers, etc. when they await the presence of a host. On finding the latter they bore their way into the body, change into legless maggots and pupate there, the males alone subsequently emerging. The presence of these parasites induces structural or other changes in their hosts including the acquisition of characters pertaining to the opposite sex (parasitic castration).

STYRENE or **STYROLENE,** also known as phenylethylene or vinylbenzene, is a hydrocarbon occurring with crude xylene in coal-tar naphtha. It is a yellow oily liquid of aromatic odour, boiling at 146° C, and with specific gravity 0·912. It is also obtained to the extent of 1 to 4% from liquid storax (styrax) and is used in medicine and in perfumery. Storax balsam (Oriental sweet gum) is derived from exudations of *Styrax Officinalis,* a shrub growing in the Levant and Greece. It is known in liquid and solid form soluble in ether or hot alcohol, it is employed in perfumery and in ointment form as a detergent. The semi-liquid balsam from *Liquidambar orientale* is obtained from Asia Minor and contains more than 25% of cinnamic acid. American storax is derived from *Liquidambar styraciflora,* found in Honduras, Louisiana, Florida and Mexico.

Styrene, $C_6H_5 \cdot CH{:}CH$, is obtained from storax by distillation with water, by heating cinnamic acid with lime, or by the action of aluminium chloride on benzene and vinyl bromide.

Phenylacetylene, $C_6H_5 \cdot C{:}CH$, a pungent liquid boiling at 139° C, results when α-bromostyrene or acetophenone chloride is heated to 130°. It yields copper and silver derivatives and is transformed into acetophenone by successive treatment with concentrated sulphuric acid and water. (G. T. M.)

STYRIA, a province of Austria covering 6,323 sq.m., lies within the Eastern Alps and is distinguished for its scenery and mineral wealth. Geographically it is divided into Upper Styria, the mountain and basin lands of the upper courses of the Enns and Mur-Mürz, and Lower Styria, the region of the middle Mur and the headwaters of the Raab. Upper Styria north of the Enns comprises detached groups of mountains which continue eastward, the huge limestone belt of the Salzburg Alps, generally exceeding 7,000 ft. in height.

Despite the mountainous character little of the soil is unproductive, only 8% of the area being classed as barren land. Forests cover 54% of its productive area, cultivated land 20% and the remainder is good grassland. In Upper Styria cultivation favours the fertile glacial moraines and alluvial fens of the stream terraces and basins, rye, oats and buckwheat being the most common cereals though wheat, barley and maize are also grown. In addition potatoes, flax, hemp and root crops are important. Lower Styria under more favourable conditions of soil and climate produces wine, fruit and hops. Cattle breeding is a flourishing activity supported by the breeding of draught horses in the marshy basins, pigs and poultry thrive in Lower Styria while sheep are on the increase everywhere; large numbers of game of various kinds are also to be found on the highlands.

The Erzberg iron mines have been worked since the Roman period and yield nearly the whole of the Austrian production. Styria supplies some 50% of Austrian lignite production. In addition there are important deposits of magnesite, *e.g.*, at Trieben, while other mineral resources include graphite, aluminium, salt, marble and building stone. The Tertiary basin of Leoben and Donauwitz, near coal and iron supplies, is the centre of the iron and steel industry; Graz (*q.v.*), the administrative, religious and intellectual capital, is also the commercial centre of the province. In the Styrian Salzkammergut around Aussee, near Graz at the spas of Gleichenberg and Tobelbad and in the Semmering district of Mürzzuschlag, an increasing revenue is derived from tourists. Styria is richly endowed with water power, notably in the valleys of the Enns, Mur and Mürz.

The population in 1923 was 977,350, equivalent to 155 persons per sq.m., but it is very unevenly distributed. In the more remote highland region of Upper Styria isolated houses or small villages are the rule, the inhabitants of villages and districts being often united in co-operative agricultural groups. Settlements in the valleys are small and strung like beads along the river courses. They are markets for the neighbouring mountain valleys and often busy manufacturing centres, but apart from Graz few towns exceed 10,000 inhabitants. The population is mainly German in speech with Slovene intermixture in the south-east, and Roman Catholic in faith. Despite a mountainous situation, the early fame of its metallic wealth attracted notice, from Roman times onwards, and it has been traversed by most of the migratory peoples of whom the Slavs left the strongest imprint. Under Charlemagne it became part of the duchy of Carinthia, obtained separate existence as the mark of Styria in 1056 and passed to the Habsburgs in the late 13th century. It is on the route from Vienna to Italy via the Semmering pass.

STYX, a stream near Nonacris in Arcadia, Paus., viii. 17, 6 ff., where see Frazer's commentary; the modern Mavro Nero (Black Water). It was thought to be virulently poisonous and capable of dissolving any vessel it was put in, save one made from the hoof of a horse. From the time of Homer, Styx (The Hateful) is one of the rivers of the underworld, generally its boundary, and the gods, if they swear by it, dare not break their oath. In Hesiod (*Theogonia,* 383 ff.), the nymph Styx, daughter of Ocean, with her children (Power, Might, Victory, and other abstractions) helps Zeus against the Titans, and is therefore honoured by him. If a god does break the oath, he is insensible for a year and then banished for nine years; mortals on occasion might take this oath, and in either case it would seem to have involved drinking the water (Hesiod, *op. cit.*, 783 ff.; Herodotus, vi., 74). We may suppose that the oath was really an ordeal; the water was a magical poison, perhaps originally fatal only to perjurers.

SUAKIN, a seaport of the Anglo-Egyptian Sudan on the Red Sea. It is a coralline islet connected with the suburb of El-Kef on the mainland by a causeway and a viaduct. Access is gained to the harbour through a winding and dangerous passage over 2 m. long, terminating in a deep oval-shaped basin several acres in extent, and completely sheltered from all winds. Suakin is to some extent superseded by Port Sudan (*q.v.*), a harbour 36 m. to the

north The custom-house and government offices present an imposing frontage to the sea, and the principal houses are of white coral stone three storeys high. Here, as at Massawa, traders were attracted by an island site which protected them from the Arabs. The mainland belonged in the middle ages to the Beja (*q.v.*), but in 1330 Ibn Batuta found a son of the amir of Mecca reigning in Suakin over the Beja, who were his mother's kin. Makrizi says that the chief inhabitants were nominal Muslims and were called Hadarib. The amir of the Hadarib was still sovereign of the mainland at the time of J. L. Burckhardt's visit (1814), though the island had been seized in 1517 by the Turks under Selim the Great Mohammed Ali after the conquest of the Sudan leased Suakin from Turkey. This lease lapsed with the pasha's death, but in 1865 Ismail Pasha reacquired the port for Egypt. It has always been the place of embarcation for Sudan pilgrims to Mecca. Legitimate commerce, rapidly growing before the revolt of the mahdi (1881), was greatly crippled during the continuance of the dervish power, though the town itself never fell into their hands. Pearl fishing is an important industry and cotton is cultivated in the neighbourhood

The port is connected by railway with Berber by submarine cables with Suez and Aden and with Jidda, which lies 200 m. north-east on the opposite coast of the Red Sea.

SUARDI, BARTOLOMMEO (*c* 1455–*c.* 1536), Italian painter and architect, frequently called Bramantino, was born in Milan, the son of Alberta Suardi. He executed paintings containing portraits of celebrated personages for the Vatican In 1508 he was engaged in Rome. Bramante d'Urbino taught him architecture, and had his assistance in the execution of the interior of the church of San Satiro, Milan. In 1525 Bramantino was appointed architect to the court by Duke Francis (II) Sforza

Bartolommeo Suardi has been confused with a certain Bramantino da Milano, of whom Vasari makes frequent mention. The Bramantino of Vasari, if he existed at all, worked for Pope Nicolas V. between 1450 and 1455.

See A. della Croce, *Le Rovine di Roma* (Milan, 1875) (from the Sketch book of Suardi in the Ambrosiana Library at Milan)

SUAREZ, FRANCISCO (1548–1617), Spanish theologian and philosopher, was born at Granada on Jan 5, 1548, and educated at Salamanca Influenced by the Jesuit John Ramirez he entered the Society of Jesus in 1564, and after teaching philosophy at Segovia, taught theology at Valladolid, at Alcala, at Salamanca, and at Rome successively After taking his doctorate at Evora, he was named by Philip II principal professor of theology at Coimbra. Suarez may be considered almost the last eminent representative of scholasticism In philosophical doctrine he adhered to a moderate Thomism On the question of universals he endeavoured to steer a middle course between the pantheistically inclined realism of Duns Scotus and the extreme nominalism of William of Occam. In theology, Suarez attached himself to the doctrine of Luis Molina, the celebrated Jesuit professor of Evora, and endeavoured to reconcile his view with the more orthodox doctrines of the efficacy of grace and special election. This mediatizing system was known by the name of "congruism."

Suarez is probably more important, however, as a philosophical jurist than as a theologian or metaphysician In his extensive work *Tractatus de legibus ac deo legislatore* (reprinted, London, 1679) he is to some extent the precursor of Grotius and Samuel Pufendorf. Grotius speaks of him in terms of high respect. Suarez refutes the divine right of kings—doctrines popular in England and to some extent on the Continent.

In 1613, at the instigation of Pope Paul V, Suarez wrote a treatise dedicated to the Christian princes of Europe, entitled *Defensio catholicae fidei contra anglicanae sectae errores.* This was directed against the oath of allegiance which James I. extracted from his subjects. James caused it to be burned by the common hangman, and forbade its perusal under the severest penalties, complaining bitterly at the same time to Philip III. that he should harbour in his dominions a declared enemy of the throne and majesty of kings. Suarez lived a very humble and simple life. He died after a few days' illness on Sept. 25, 1617 at Lisbon

The collected works of Suarez have been printed at Mainz and Lyons (1630), at Venice (1740–51), at Besançon (1856–62) and in the collection of the Abbé Migne. His life has been written by Deschamps (*Vita Fr. Suaresii*, Perpignan, 1671). The chief modern authorities are K. Werner's *Franz Suarez u die Scholastik der letzten Jahrhunderte* (Regensburg, 1861), and Stockl's *Geschichte der Philosophie des Mittelalters,* iii. 643 *seq.*

SUB-ATOMIC ENERGY: *see* ATOM; ELECTRICITY· *Electrons;* NUCLEUS; RADIOACTIVITY.

SUBCONSCIOUS, in psychology, means anything that is neither in the focus nor in the margin of consciousness (that is, does not receive attention, and so cannot be recognized in the actual experience of the moment), but which nevertheless must be assumed to be influencing us in some way, as a disposition, etc *See* ABNORMAL PSYCHOLOGY, PSYCHOLOGY, with bibliographies.

SUB-DOMINANT, in music, the 4th degree of the diatonic scale, as F in the scale of C. (HARMONY; INTERVAL.)

SUBIACO (anc. *Sublaqueum*), a town of Italy, picturesquely situated on the Anio, 1,339 ft. above sea-level. Pop. (1921) 8,218 (town), 9,108 (commune). It was so called from its position under the three artificial lakes constructed in the gorge of the Anio in connection with the aqueduct of the Anio Novus, which had its intake at the lower end of the lowest of them (the *Simbruina stagna* of Tacitus). On the banks of this lake Nero constructed a villa, in the remains of which was found the beautiful headless statue of a youth kneeling, now in the Museo delle Terme at Rome. The lakes ceased to exist, the last dam being washed away in 1305 In 494 St Benedict retired as a hermit to a cave (Sacro Speco) above the lakes of the Anio In 505, probably, he founded the first of his twelve monasteries The church dedicated to S. Scholastica, S. Benedict's sister, was erected in 981. In 1053 it was restored and a campanile built, which still exists; and in the middle of the 13th century the church was rebuilt in the Gothic style. Other buildings grew up round it; the cloister on the right is a fine Romanesque arcaded court with twisted columns and Cosmatesque (13th cent.) mosaics, the south side by Lorenzo Cosmati, the other three sides by his sons (*c.* 1227–1243). *See* BENEDICTINES.

Arnold Pannartz and Conrad Schweinheim, two German ecclesiastics, set up here the first printing press in Italy, issuing an edition of Donatus (1464), followed by one of Cicero (1465) and of Lactantius (1465). Copies of the Lactantius, of the Augustine of 1467, printed not here but in Rome, and of other rare *incunabula* are preserved here. Still more interesting is the monastery of the Sacro Speco, higher up the hill The Grotta dei Pastori has frescoes of the 9th century, while the Sacro Speco, or cave of St. Benedict, contains frescoes of the 13th, and so does the lower church, the latter having been in part repainted in the latter half of that century by an unknown master Conxolus The upper church contains scenes from the life of Christ by a Sienese master of the end of the 14th century, to whom is also attributable a remarkable fresco of the triumph of death and some 15th-century work, and in the chapel of S. Gregory a portrait of St. Francis of Assisi (who was perhaps here in 1218), probably painted before 1228, as it lacks the halo and the stigmata. The whole group of buildings is constructed against the rocky sides of the gorge, part of it on massive substructions. The town contains various buildings constructed by Pius VI., who as cardinal was commendatory abbot of Subiaco It is crowned by a mediaeval castle constructed originally by Gregory VII.

See P. Egidi, G. Giovannoni, F Hermanin, V. Federici, *I Monasteri di Subiaco* (Rome, 1904); A. Colasanti, *L'Aniene* (Bergamo, 1906). (T. A.)

SUBJECT: *see* TERM, JUDGMENT and LOGIC.

SUBJECTIVISM, a philosophical term, applied in general to all theories which lay stress on the purely mental sides of experience, opposed to objectivism. In the narrowest sense subjectivism goes to the logical extreme of denying that mind can know objects at all (*cf.* SOLIPSISM: IDEALISM).

SUBLEYRAS, PIERRE (1699–1749), French painter, was born at Uzès (Gard) in 1699. He gained the *grand prix* and went to Italy in 1728. His first important work was "Christ's Visit to the House of Simon the Pharisee" (Louvre, engraved by Subleyras himself), ordered by the canons of Asti, which made his repu-

tation and procured his admission into the Academy of St. Luke. Cardinal Valenti Gonzaga next obtained for him the order for "Saint Basil and the Emperor Valens" (small study in Louvre), which was executed in mosaic for St. Peter's. Benedict XIV. and all the princes of Rome sat to him, and the pope himself commanded two great paintings—the "Marriage of St. Catherine" and the "Ecstasy of St. Camilla"—which he placed in his private apartments. Subleyras shows greater individuality in his curious genre pictures, which he produced in considerable numbers (Louvre). In his illustrations of La Fontaine and Boccaccio his true relation to the modern era comes out; and his drawings from nature are often admirable. (*See* one of a man draped in a heavy cloak in the British Museum.) He died in Rome on May 28, 1749. His wife was a celebrated miniature painter, Maria Felice Thibaldi.

SUBLIMINAL SELF. The phrase owes its wide currency to the writings of F. W. H. Myers, especially to his posthumous work *Human Personality and its survival of Bodily Death.* In the stricter usage the phrase stands for an hypothesis which seemed to its author to bring almost all the strange facts he observed under one scheme of explanation. But the phrase "Subliminal Self" is now often used by those who do not fully accept Myers's hypothesis, as a convenient heading to which to refer all the facts of many different kinds that seem to imply subconscious or unconscious mental operations. It is the stricter sense that here concerns us.

In the speculations of Schopenhauer and of Eduard von Hartmann, the "Unconscious" played a great part as a metaphysical principle explanatory of the phenomena of the life and mind of both men and animals. But with these exceptions, the philosophers and psychologists of the 19th century showed themselves in the main reluctant to admit the propriety of any conception of unconscious or subconscious mental states or operations. The predominant tendency was to regard as the issue of "automatic" nervous action or of "unconscious cerebration" whatever bodily movements seemed to take place independently of the consciousness and volition of the subject, even if those movements seemed to be of an intelligent and purposeful character. This attitude towards the subconscious is still maintained by some of the more strictly orthodox scientists: but it is now very widely accepted that we must recognize in some sense the reality of subconsciousness or of subliminal pyschical process. The conception of a *limen* (threshold) of consciousness, separating subconscious or subliminal psychical process from supraliminal or conscious psychical process, figured prominently in the works of G. T. Fechner, the father of psycho-physics, and by him was made widely familiar. In the last half century, there has been accumulated a mass of observations which establish the reality of processes which express themselves in purposeful actions and which bear all the marks from which we are accustomed to infer conscious cognition and volition, but of which nevertheless the subject or normal personality has no personal knowledge.

Among the commonest and most striking of such manifestations is the "automatic writing" which a considerable proportion of normal persons are capable of producing. A person who has this power may sit absorbed in reading or in conversation, while his hand produces written words or sentences, of which he knows nothing until he afterwards reads them. In some cases the matter so written states facts previously known to the subject but which he is unable to recollect by any voluntary effort. And in rare cases the matter written seems to imply knowledge or capacities which the subject was not believed to possess either by himself or by his friends. Other actions, including connected speech, may be produced in a similar fashion, and in the last case the subject hears and understands the words uttered from his own mouth in the same way only as those from the mouth of another person. "Table-tilting," "planchette-writing," and the various similar modes of spelling out by the aid of a code intelligible replies to questions, which have long been current in spiritistic circles and which, by those who practise them, are often regarded as the operations of disembodied intelligences, seem to belong to the same class of process. In extreme cases the manifestations of such subconscious or (better) co-conscious operations are so frequent, exhibit so much continuity and express so clearly a train of thought, purpose and memory, that they compel us to infer an organized personality of which they are the expression; such are the cases of double or multiple consciousness or personality. Very similar manifestations of a "co-consciousness" may be produced in a considerable proportion of apparently normal persons by means of post-hypnotic suggestion; as when suggestions are made during hypnosis, which afterwards the subject carries out without being aware of the actions, or of the signals in response to which he acts, and without any awareness or remembrance of the nature of the suggestions made to him. The more sober-minded of the investigators of these phenomena have sought to display all such cases as instances of division of the normal personality, and as explicable by the principle of cerebral dissociation (*see* HYPNOTISM); the more adventurous, concentrating their attention on the more extreme instances, regard all such manifestations as instances of the possession and control (partial or complete) of the organism of one person by the spirit or soul of another, generally a deceased person. Myers's hypothesis of the subliminal self was a brilliant attempt to follow a middle way in the explanation of these strange cases, to reconcile the two kinds of explanation with one another, and at the same time to bring into line with these other alleged facts of perplexing character, especially veridical hallucinations (*q.v.*), various types of communication at a distance (*see* TELEPATHY), and all the more striking instances of the operation of suggestion and of hypnosis, including the exaltation of the powers of the senses, of the memory and of control over the organic processes.

Myers conceived the soul of man as capable of existing independently of the body in some super-terrestrial or extra-terrene realm. He regarded our normal mental life as only a very partial expression of the capacities of the soul, so much only as can manifest itself through the human brain. He regarded the brain as still at a comparatively early stage of its evolution as an instrument through which the soul operates in the material world. So much of the life of the soul as fails to find expression in our conscious and organic life through its interactions with this very inadequate material mechanism remains beneath the threshold of consciousness and is said to constitute the subliminal self. It is held to be in touch with a realm of psychical forces from which it is able to draw supplies of energy which it infuses into the organism, normally in limited quantities, but, in exceptionally favourable circumstances, in great floods, which for the time being raise the mental operations and the powers of the mind over the body to an abnormally high level.

Abnormal mental manifestations that have commonly been regarded as symptoms of mental or nervous disease or degeneration are by its aid brought into line with mental processes that are by common consent of an unusually high type, the intuitions of genius, the outbursts of inspired poesy, the emotional fervour or the ecstasy that carries the martyr triumphantly through the severest trials, the enthusiasm that enables the human organism to carry through incredible labours. Myers's hypothesis thus boldly inverts the dominant view, which sees in all departures from the normal symptoms of weakness and degeneracy and which seeks to bring genius and ecstasy down to the level of madness and hysteria; the hypothesis of the subliminal self seeks to level up, rather than to level down and to display many departures from normal mental life as being of the same order as the operations of genius.

This bold and far-reaching hypothesis has not up to the present time been accepted by any considerable number of professional psychologists, though its author's great literary power has secured for him a respectful hearing.

SUBMARINE. A submarine is a vessel capable of being submerged and propelled under water and essentially armed with torpedoes which can be fired while submerged, aim being taken by means of a periscope, which alone is visible to the surface craft being attacked. Submarines are also fitted with a gun armament to be used when on the surface, and in some instances for minelaying. Three British submarines M1, M2, M3, were equipped with a 12 in gun apiece. One of these has had her big gun replaced by a hangar to carry a small seaplane.

In view of aerial warfare, it would be a mistake to regard a repetition of submarine warfare on German lines as beyond the range of possibility.

It may be claimed for the new class of big cruiser submarines that they are better able to "visit" and "search" merchant ships than German submarines were in the World War. However used, there can be little doubt that the development of this type of warship does constitute a new danger to merchant shipping in war, and one which it will certainly be more difficult to track down than the surface cruiser. On the other hand, the production of under-water craft of this size gives less excuse for the adoption of a "sink at sight" policy. In spite of their lack of success as fleet units in the World War, endeavours are still being made by some of the principal sea Powers to develop the submarine in this capacity. But apart from difficulties of speed and limited range of vision, it would seem that the retention of submarines in company with the surface fleet must complicate tactics and add considerably to an admiral's difficulties and anxieties in a fleet action. The exact measures for combating submarines are necessarily confidential, but it may be taken for granted that the lessons of the World War have been taken to heart and that scientific improvements in anti-submarine devices have continued.

A new form of defence against the submarine, and possibly a new ally for her, has arisen in the form of the aeroplane. The surface warship in her turn is now better equipped to withstand underwater attack than ever before. Only the merchant vessel remains as defenceless as ever

Great Britain and the United States have expressed their readiness to outlaw the submarine as a weapon of war, but lesser naval powers, like France and Italy, have declined. They explain that while they in no way subscribe to the employment of submarines on the lines adopted by Germany in the World War, they do regard these craft as legitimate and economical units in their sea defences which they cannot afford to do without. (E. A.)

TECHNICAL

The history of the submarine dates from 1620 when Cornelius van Drebel, a Dutchman in the service of King James I. of England, built such a vessel, which is stated to have been navigated by twelve rowers at a depth of 12 to 15 feet for several hours in the Thames. Van Drebel was followed by others during the 17th and 18th centuries either with designs or actual vessels, but it was not until 1776 that a submarine was used for war purposes In that year the "Turtle," an American submarine designed by David Bushnell, attempted to sink the English warship "Eagle" anchored off New York, by fixing a gun powder charge with time fuse to the "Eagle's" bottom by a screw. All attempts to force the screw through the copper sheathing failed, and the submarine rowed away, releasing the charge, which exploded without damage. On the night of February 17th 1864 during the American Civil War, the "Housatonic," blockading Charleston, was sunk by a spar torpedo fitted over the bow of a submarine. The submarine swamped through an open hatch, sank and was lost with her crew of nine men. The loss of the "Housatonic" is the first recorded instance of a warship being sunk by a submarine.

In France and the United States experiments were numerous, progress was slow but sure, and finally the naval authorities of the two nations decided the submarine had attained a stage of development which warranted its inclusion in their navies. In France, the "Gymnote," the first naval submarine, was ordered in 1886 and launched in 1888. Originally prepared by Dupuy de Lome, the design was modified by Gustave Zedé, who was placed in charge of its construction. She was of 30 tons displacement, fitted with a screw propeller driven by an electric motor supplied with current from secondary cells. The trials being satisfactory, the "Gustave Zedé" of 270 tons, similarly propelled, was ordered in 1890 and launched in 1893. Success was again attained, and in 1896 the Ministry of Marine opened a competition for the design of submarines, the first prize being awarded to M. Max Laubeuf, the "Narval" built to his design being completed in 1900.

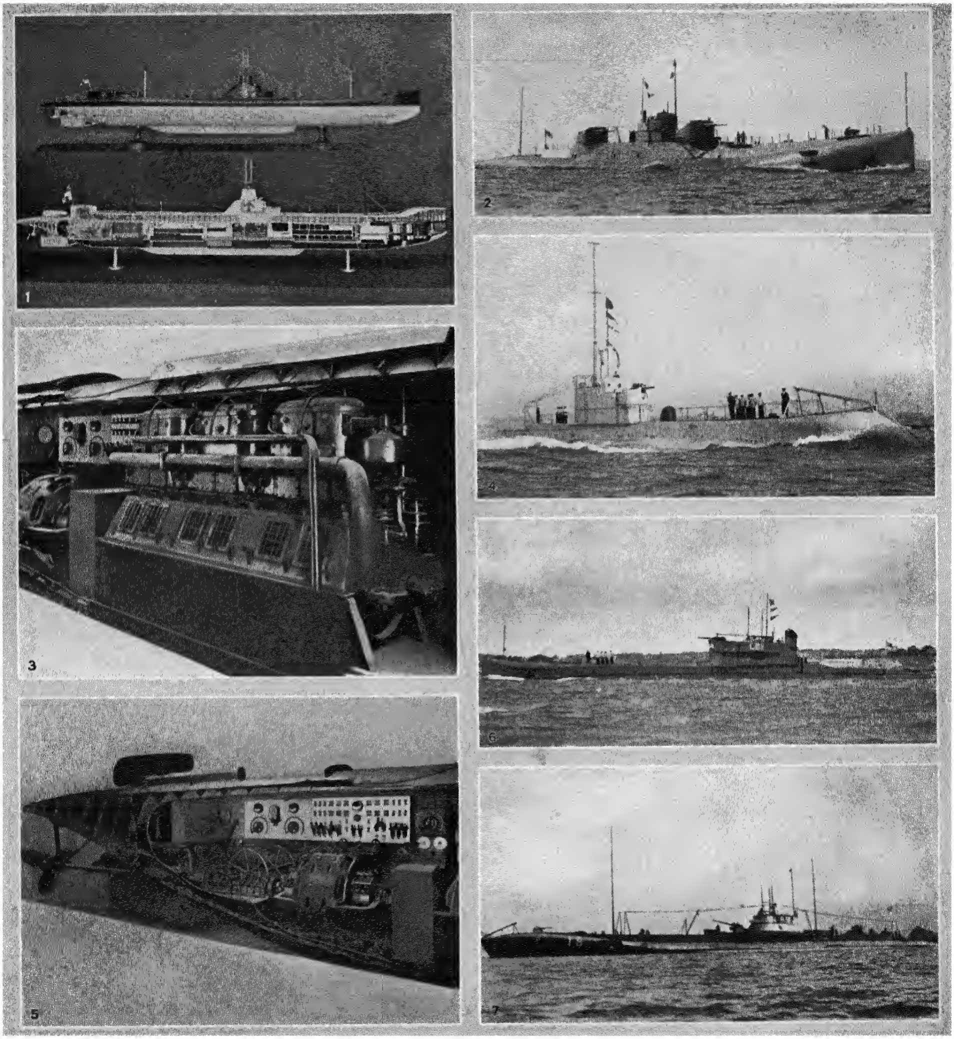
In the United States, John P. Holland, engaged in the study of the problem for many years, built the first of several submarines in 1875. Other early research was undertaken by Simon Lake who developed the "Lake" type submarine. In 1888 the Navy Department invited submarine designs, that of Holland being selected, but the contract for the "Plunger" to that design was not signed until 1895. She was to be propelled by steam on the surface, and an electric motor submerged, but before completion, Holland, dissatisfied with the design, returned the sums advanced by the Government, and started on the "Holland." She was purchased for the U.S. Navy on April 11, 1900, five similar vessels being ordered to be built. On Dec. 13, 1900, the British Admiralty ordered five of the same type from Messrs Vickers, who had obtained the rights to build to the Holland designs. In Italy the "Pullino" of 25 tons designed by a naval engineer of that name was launched in 1892, and was followed by the "Delfino" of 95 tons, launched in 1894. In Germany two submarines of 200 tons of Nordenfelt design were completed in 1890, but until 1906 the construction of this type of vessel was not seriously taken in hand for that navy.

Types of Hull Construction.—In order to submerge a submarine several tanks designated "main ballast tanks" are completely flooded and a less number of smaller tanks are partly flooded. As these tanks when filled bring the vessel from the surface to the submerged condition, their total volume is the reserve of buoyancy of the submarine when on the surface, and is a measure of her seaworthiness Submarines are either "single hull" or "double hull."

The "Gymnote," "Gustave Zedé" and "Holland" were of the first type having a strong hull of circular section throughout, the centres of the circles lying on a straight line, the axis of the submarine. In later examples the circular changes into elliptical sections at the extremities, the centres of the sections rising towards the ends. The main ballast tanks are at the bottom of the circles, and may or may not have vertical extensions at the sides enclosing the battery spaces (fig. 1).

The "Narval" of Laubeuf, the first of the double hull type, had a strong hull of almost circular section,—the pressure hull—enclosed by another—the outer hull—of light construction, the space between the two being the ballast tanks (fig. 2). The capacity of the latter was far greater than in the single hull type, being in "Narval" 41 per cent of the displacement as compared with 13 in the "Holland." The removal of these tanks from inside the pressure hull gives more space in the latter for other purposes. In addition to improved seaworthiness, a better shape for surface propulsion can be given the outer hull and increased speed obtained. When air pressure is used to clear the ballast tanks of water, this pressure is brought on the curved surface of the pressure hull, instead of on the flat plating of the tanks in the single hull type. The pressure on the outer hull, when blowing, is the small difference between air and sea pressure, permitting the outer hull to be of light construction. The metacentric height of the single hull type on the surface is small, that of the other type can be made any desired amount by a suitable choice of breadth of the outer hull. The single hull type has the advantage of more rapid submergence, the tanks being smaller and well below the surface water plane, whilst parts of the tanks in the double hull type are above that plane. The double hull type is heavier and costs considerably more to build.

Generally the single hull type of construction is now limited to the smallest submarines, the double hull to the largest. In the medium size a partial double hull is adopted, the outer hull



INTERIOR AND EXTERIOR VIEWS OF VARIOUS TYPES OF SUBMARINES AND SUBMARINE MODELS

1. Exterior view and longitudinal section of the U–1, the first German U–Boat. Displacement on surface, 240 tons. Armament: one bow torpedo tube; carrying capacity, three torpedoes. Speed on surface, 11 knots; submerged, 9 knots. Built at the Germania Works, Kiel, in 1906
2. H.M.S. "X. I." Displacement on surface, 2,525 tons; submerged, 3,600 tons. Armament: four 5·2-in. guns, six 21-in. torpedo tubes. Speed on surface, 19·5 knots; submerged, 9 knots
3. Munich Museum model of the U–1, showing that portion of the engine room containing the 450 h.p. petroleum motors used to drive the twin screws which propel the submarine on the surface
4. H.M.S. Oxley. Displacement on surface, 1,400 tons; submerged 1,835 tons. Speed on surface, 15·5 knots; submerged, 9 knots. Built in England in 1927 as the first in the Australian Navy
5. Munich Museum model of the U–1, showing the aft section of the submarine and the electric drive, including one of the 200 h.p. motors used for propulsion
6. H.M.S. "L. 69." Displacement on surface, 960 tons; submerged, 1,150 tons. Armament: one 4-in. gun, and six 21-in. torpedo tubes. Speed on surface, 17·5 knots; submerged, 10·5 knots
7. Japanese first class submarine T 55. Displacement on surface, 1,700 tons; submerged 2,000 tons. Armament: one 4·7-in. gun, and eight torpedo tubes. Speed on surface, 20 knots; submerged, 7·9 knots. Built in 1927

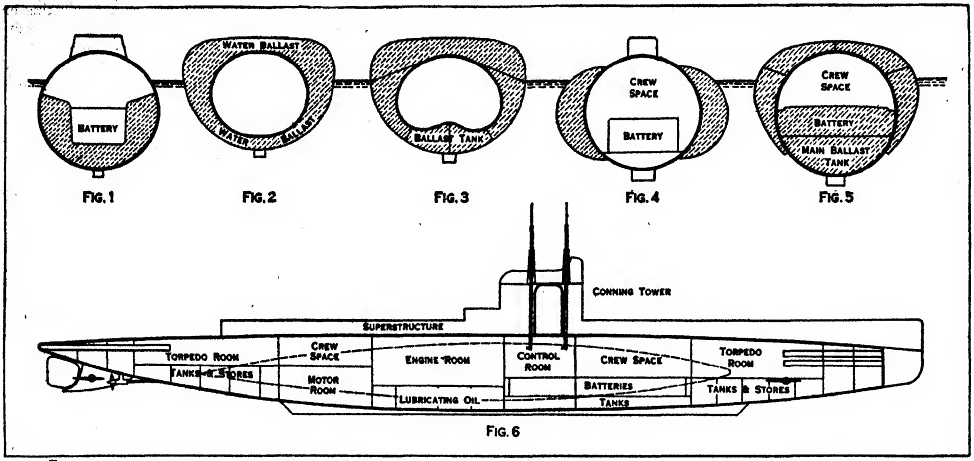


FIG. 1.—SINGLE HULL, FIRST TYPE OF SUBMARINE MADE; FIG. 2.—DOUBLE HULL, DESIGN USED IN LARGE SUBMARINES; FIG. 3.—PRESSURE HULL, DESIGNED FOR STOWAGE SPACE; FIGS. 4 & 5.—PARTIAL DOUBLE HULL TYPE, USED IN SUBMARINES OF MEDIUM SIZE; FIG. 6.—SUBDIVISIONS OF SUBMARINE OF MEDIUM DISPLACEMENT, SHOWING TANKS FORE AND AFT FOR TRIMMING

enclosing the pressure hull over a portion of its extent only, both transversely and longitudinally (figs. 4 and 5). Fig. 3 shows the section of pressure hull adopted by Colonel Laurenti of the Fiat Company, the shape being designed to suit the requirements of stowage. Fig. 4 is the section of the British D, E and L classes, the bulk of the ballast water being outside the pressure hull. Fig. 5 is a section of the British K class. In the latest types of "double" and "partial double hull" submarine oil fuel is also stowed between the two hulls. The double hull types are sometimes termed "submersibles" to indicate they are especially suitable for surface propulsion.

Superstructure.—The "superstructure" is the light structure fitted above the pressure or the external hull, in which are stowed the cable holders, boats, bollards, hatches, mufflers, fairleads and other fittings, and which unless enclosed would cause undue resistance when submerged. The superstructure is fitted with a deck, and is raised in height amidships to form a navigating bridge, which is reached from the control room through the conning tower built up from the pressure hull. The conning tower is fitted with hatches at the bottom and at the bridge level, and being the last portion of the pressure hull to submerge, is frequently constructed of thick plating to resist projectiles. The conning tower forms a base for the vertical brackets which support the periscopes. The sides of the raised superstructure enclosing the conning tower and other high openings and forming a support for the bridge is called a conning tower cutwater. The superstructure with the exception of the low buoyancy tanks is "free flooding," *i.e.*, it is flooded and vented when submerging through open holes along its sides, the air escaping through numerous holes in the superstructure deck. The low buoyancy tanks are free flooding, central vented.

Subdivision.—Except for the tanks essential for their operation, earlier submarines had little or no watertight subdivision. In later types the hull is subdivided to the maximum extent, experience having proved the value of this feature in case of accident. Transverse bulkheads are the main feature of subdivision, a submarine of medium displacement having at least six main compartments, whilst at the extremities trimming and other tanks are added (fig. 6). Starting from forward the main compartments in order are: the fore torpedo room, into which the bow torpedo tubes project and from which they are loaded and operated; the battery space, the lower portion of which contains the battery cells whilst accommodation for the crew is provided in the upper portion; the control room, in which all controlling mechanisms for the submerged operations of the submarine are fitted, whilst below is a battery space and over the conning tower giving access to the bridge; the engine room with the two Diesel engines, the spaces below them being utilised for the lubricating oil tanks; the motor room with the main motors and switchboards and some accommodation for the crew; and finally, the stern torpedo room containing the breech ends of the torpedo tubes, spare torpedoes, and the motors and gear for rudder and hydroplanes. A deck further subdivides the two torpedo rooms, the spaces below it being divided by watertight bulkheads, boundaries to the compensating and fresh water or fuel oil tanks and provision and other stores. In a single hull submarine the main ballast tanks are below and at the sides of the battery, and at the bow and stern, whilst in a double or partial double hull submarine the space between the two hulls is divided by transverse bulkheads and flats to form main ballast and oil fuel tanks.

The main bulkheads at the after end of the fore torpedo room and at the fore end of the stern room are generally tested to 35 or 50 lb. per sq.in., the two rooms being sometimes termed refuge compartments, where in case of accident the survivors may take refuge. The other main bulkheads are tested to 15 to 20 lb. per sq.in., being primarily intended to limit the entry of water in surface collisions. The bulkheads at the extremities are tested to 50 to 75 lb. whilst those below the decks are subject to 50 lb. test and those between the hulls to 15 or 20 pounds. In many submarines the transverse bulkheads are of curved form to better withstand the pressure. Watertight doors of a special quick closing type are provided, with manholes, and other means of access.

Tanks in Submarines.—The most important tanks are the "main ballast tanks" by the filling of which almost all the positive buoyancy is destroyed. Each tank has a valve at the bottom for the entry or exit of water; a vent valve at the top for the escape of air; and a pipe through which compressed air enters the tank and forces out the water. Some tanks are also fitted with drain pipes for emptying them by pumping. When cruising on the surface the bottom valve may be open and the vent valve closed. Water then enters the tank compressing the air until the pressure prevents further entry, or a slight air pressure is put into the tank to limit the water to the least amount. When submerging all main ballast vent valves are opened, water floods the tanks, the air escaping through the vent valves, which, when the tanks are full, are closed. The submarine "Narval" on her first trials

submerged in 25 minutes, reduced to 12 when the crew were trained. War experience has shown that the time for submersion is a vital factor in escaping gun attack or ramming, and the valves have been increased until 1 to 2 minutes is now required. The flooding valves are open and vent valves closed when submerged, and the submarine is brought to the surface by forcing air into the tanks, thus clearing out the water The vent and blowing valves are all operated from the control room. When enemy ships may be met, a submarine navigating on the surface has her main ballast tanks partially filled to secure more rapid submergence. If the tanks are half full she is at "half buoyancy," and if three-quarter, at "quarter buoyancy," if empty she is at "full buoyancy" Some of the main ballast tanks are arranged for the stowage of fuel, in case extra cruising endurance is required

A submarine is at "main ballast trim," or in "diving trim," when the flooding of the main ballast tanks alone will bring her to the desired submerged condition, with practically no reserve of buoyancy. During war or practice operations, a submarine is always in "main ballast trim," or in "diving trim," and can at once submerge. To maintain this trim the officers have to exercise a ceaseless vigilance, any loss or gain of weight being met by letting in or blowing or pumping out water. For this purpose "compensating tanks," or "auxiliary ballast tanks," are provided, generally one on either side amidships, and one at either end These have flooding, venting, pumping and blowing arrangements, and gauges to indicate the amount of water in them under all conditions.

The oil fuel is the main item for which compensation is needed. The fuel is stored in the "oil fuel tanks," sometimes placed in the spaces exterior to the pressure hull in the "double hull" or partial "double hull" type, and necessarily inside in the "single hull" type. The fuel tanks are completely filled with oil, and are positioned symmetrically transversely and longitudinally. When fuel from a tank is required, it is forced to the engine room by pumping sea water into the bottom of the tank, the oil passing out through a pipe at the top. The difference in densities between sea water and oil fuel prevents mixing, but involves an increase in weight as fuel is used. If, for example, the oil fuel is ·9 specific gravity, and a tank of 500 cubic feet has been emptied of fuel and filled with sea water, the added weight is 3,900 lb., and this weight of water must be discharged from the compensating tanks. Other items, *i e*, lubricating oil, ammunition, shell, food, fresh water, etc, when consumed, must be compensated for by adding an equal weight of water, the compensating tank used for the purpose being as close as possible, longitudinally, to the item consumed. In minelaying submarines special tanks are fitted for compensating for the release of mines

For correcting any alteration in the longitudinal distribution of weight, a "trimming tank" is fitted at either end of the vessel They are partially filled in the normal diving condition and connected by a pipe through which water is forced from one to the other as required

"Water around torpedo" tanks are fitted below the centre of length of the torpedo tubes, and contain sufficient water to fill the spaces around the torpedoes when in the tubes. By their use the torpedoes can be left dry in the tubes and withdrawn for examination If it is desired to fire a torpedo the tube is closed, the water from the "water around torpedo" tanks is blown into the tube, and when the cap of the tube is opened, no water enters and the weight of the submarine is unaltered An experienced submarine officer keeps a log of the variations of weight of the stores and of the amount of water in all his tanks, and checks the records on every convenient occasion by submerging his vessel.

Air System.—The compressed air for blowing tanks and for the torpedo service is stored in reservoirs or air bottles at 2,500 lb per square inch. The capacity of a reservoir varies in different navies, but in British submarines is about 3 cubic feet and the number sufficient to blow the ballast tanks three times They are recharged by compressors when the vessel is on the surface with hatches open. A shore connection is fitted for use when charging from the shore or parent ship It was formerly the practice to clear the tanks entirely by air from the reservoirs, but the vessel is now brought to the surface by partially clearing one or more ballast tanks with stored air, and fully clearing the tanks by motor driven air or blowers which, with the conning tower hatch open, supply air at 15 or 20 lb. per square inch. Divers' connections are fitted in the superstructure for supplying air to the compartments in case of accident.

Pumping System.—At least two motor driven pumps are provided for pumping out a submarine. These are capable of pumping against any pressure up to that at the greatest depth the vessel is designed to navigate Both deliver overboard, and their suctions are connected with at least two of the main ballast tanks for use in the event of the compressed air failing.

Rudder and Hydroplanes.—The rudder is like that of a surface ship Hydroplanes, or horizontal rudders, are used for the depth and horizontal control of submarines when navigating submerged In earlier submarines, a pair of hydroplanes were fitted at the stern, but now a pair is fitted forward and a pair aft, the latter generally in the propeller races The hydroplanes are rectangular or elliptical in shape, and are of the balanced type. They can be turned through 30 or 35 degrees either way by a motor and mechanism The after pair are of greater area than the forward, and when in the neutral position act as fins, giving a certain amount of stability to the motion of the vessel The forward hydroplanes are generally fitted below the surface waterplane, but in fast submarines they are often placed above water, and are of the housing type, stowing in or against the superstructure. The resistance to surface propulsion is thereby decreased, and the hydroplanes are not subjected to the forces of the sea When a vessel is diving the hydroplanes are used to overcome the small reserve of buoyancy usual when submerged.

The operating motor and mechanism of each pair of hydroplanes are controlled by a handwheel mounted on a pedestal in the control room, close to the commander The two pedestals are placed side by side, with a diving coxswain at each wheel In front of each is a depth gauge showing the depth below water, and a clinometer giving the longitudinal inclination of the vessel The coxswain at the forward pedestal moves his wheel, and by it the forward hydroplanes, to maintain the depth ordered by the commander, whilst his colleague moves the after wheel and the after hydroplanes to maintain the submarine horizontal. In the earlier types with after hydroplanes only, change of depth was attended with large longitudinal inclinations of the submarine In the event of a breakdown of the motors operating the hydroplanes, hand gear can be used Hydroplane guards are fitted to prevent wires catching in the hydroplanes when passing through nets fitted as a defence to entrances to harbours, etc

Periscopes.—The earliest submarines had a circular tower amidships which projected above the hull, glass lights around its circumference serving for the navigation of the vessel The submarines "porpoised" to allow for frequent observations Later an optical tube, fitted with inclined mirrors top and bottom, was added giving deeper immersion of the hull, if not better observation The periscope was introduced about 1902 It consists of a tube with a window and a glass prism at the top, and an eye piece and prism at the bottom, various lenses being fitted in the tube to obtain the best image at the eyepiece The periscope tube is about 6 inches diameter, with 5 or 6 feet of the upper portion reduced to 2 or 3 inches diameter, about 3 feet being above water when the periscope is fully raised, the submarine then being at "periscope depth" The field of view is restricted to about 15 degrees, but two handles allow the observer to rotate it and sweep the horizon, the angle in azimuth being projected on the image. The length of the periscope has gradually increased, and 30 to 35 feet is now not unusual, the pressure hull of the vessel being 25 to 30 feet below the sea level. Two periscopes, one before and one abaft the conning tower, are fitted in the majority of submarines, but the largest types have three. The normal view is a horizontal one, but aircraft have necessitated an addition by which the top prism can be rotated, and an almost vertical view obtained.

Propulsion of Submarines.—Towards the middle of the 19th century designers turned to steam engines and screw propellers

for both surface and submerged propulsion, but a funnel and an air duct extending above water when submerged had to be fitted. In 1860, Brun and Bourgeous in the "Plongeur" fitted an air engine, the compressed air for its operation being stored in large cylinders, the vessel being completely closed in when submerged. In 1863 the American, Alstitt, used steam for surface propulsion, and an electric motor and battery when submerged, the first instance of the dual methods of propulsion. The "Gymnote" and the "Gustave Zedé" were fitted with electric motors for both surface and submerged propulsion, and had to return to their base for recharging when the batteries were exhausted. The "Narval" had a petrol engine for surface, and an electric motor and battery for submerged navigation, and the "Holland" was similarly equipped. The internal combustion engine possesses marked advantages for the surface propulsion of submarines, and the evolution of the latter has closely followed that of the former. Petrol engines were replaced by Diesel engines when the latter had sufficiently developed (1905), the first British submarine so fitted being "A.13" completed June, 1908. In the modern submarine twin screws are fitted, the propeller shafts being driven either by the Diesel engines, or by the electric motors placed abaft the engines. For submerged propulsion the motors drive the propellers. The motors are generally used for surface propulsion when navigating in narrow waters or coming alongside ships or quays, being more easily operated than the engines.

The Diesel engines fitted in submarines are of a special type running at from 380 to 450 revolutions per minute when developing full power. In 1914 the b.h.p. of the largest available submarine Diesel unit was from 800 to 900 in 6 to 8 cylinders. At present the most powerful unit develops 3,000 b.h.p., but the diameter of hull for two such engines is such, that the size of the submarine is too large for ordinary naval purposes, and consequently less powerful engines are being fitted, ranging from 1,200 to 2,400 b.h.p. per unit. The displacement of submarines has gradually increased with the power of the available engines. In 1914 the largest submarines had surface displacements of from 600 to 800 tons, it is now 2,800 tons in a few special cases, but in the majority of new vessels ranges from 1,000 to 1,800 tons. The surface speed in 1914 varied from 15 to 18 knots, it is now from 17 to 20. With the 3,000 b.h.p. engine it is estimated that no more than 22 to 23 knots surface speed can be attained, the displacement reaching about 3,000 tons.

Steam was employed in some of the earlier classes of French submarines, and in the British "K" Class. In the former the Diesel engines were unreliable and had to be replaced by steam, whilst in the "K" Class the speed required (24 knots) was beyond the possibility of the Diesel engine. Turbines of 10,000 b.h.p. were therefore installed, and an auxiliary Diesel engine driving a generator which supplied current to the main motors on the propelling shafts was also fitted for low speeds. The number of large openings for funnels and boiler air supply, the greater consumption of fuel per unit power with the consequent limited endurance, and the heat in the engines and boilers after submergence, are objections to steam and strong reasons for the preference for Diesel engines. At present the British "K.26" is the only steam propelled submarine in commission.

Batteries.—The underwater propulsion and navigation of a submarine depend upon the batteries which supply current to the propelling, rudder and hydroplane motors. These batteries are of the lead pasted plate type, the details varying with the makers. In small submarines, two batteries of 55 to 60 cells are installed, and in the larger, two or three of 110 to 120 cells each. For convenience in replacement and transfer, the cell containers have standardised dimensions, those in British submarines being such that the cell weighs about 900 lb. The power for submerged propulsion varies with the cube of the speed, and the higher the latter the sooner the battery is exhausted, necessitating recharging by the engines on the surface. The cruising underwater speed is from 2 to 3 knots, the battery capacity being sufficient to maintain this for 30 hours, and also meeting the auxiliary requirements. At full speed the battery is exhausted after 1 to 1½ hours. The capacity of a typical cell is such that a current of 2,300 amperes can be maintained for one hour or 225 for 20 hours when fully charged. These currents, with the appropriate voltages, correspond to about 5·5 h.p. and ·5 h.p. per cell. In the smaller types the cells stand on the crown of the ballast tanks, portable wooden beams and airtight covers closing the space, and in the larger a steel deck is fitted over the battery room, the cells at the sides standing at different levels to suit the section. When the battery is being charged hydrogen gas is evolved, and to obviate explosions, exhaust fans and trunks discharge this into the open. A battery switchboard is fitted in or close to the control room.

Armament.—The submarine is essentially a torpedo vessel, launching its torpedoes when submerged and unseen. The size of the torpedo and number of discharge tubes have gradually increased, the usual armament at present being the 21 inch torpedo, the largest conveniently manhandled, with four tubes at the bow and two at the stern. The tubes are horizontal and fore and aft, the breech ends being inside the pressure hull, loading and other operations being readily effected when submerged. Two torpedoes for each tube is the usual complement, one being stowed in the tube and the other in the torpedo room. Each tube has a water-tight cover at either end, the inboard cover being opened and closed in the torpedo room, whilst that outboard—the cap—is operated by gearing from the room. The apertures for discharge in the bow are fitted with shutters which open and close with the caps, and when closed give a fair form to the bow to reduce resistance. The torpedoes are discharged by air pressure, either from the control room by the commander or at the tubes at his orders. The French are partial to revolving tubes fitted in the superstructure and trained by mechanism from the interior of the vessel. Such tubes are lighter than the ordinary tube, but have the disadvantage that they can only be loaded on the surface.

Previous to 1914 a few submarines carried a small gun of the disappearing type stowed in the superstructure. By the end of 1918 guns were fitted in all classes, the calibre having gradually increased, the limit being reached in the British "M" Class with one 12 inch. B.L. gun, the largest German submarine having two 150 mm. Against merchantmen the gun with a large number of rounds was more effectual than the relatively small number of torpedoes which could be carried. A 4 or 5 inch gun is now mounted in all classes, and although it is recognized that in a gun duel with an ordinary warship the submarine is at a great disadvantage, the gun may prove useful against weaker vessels or aircraft. The guns are mounted on the superstructure in the open, reducing the submerged speed and endurance.

During the War the submarine was utilised for a purpose not previously suggested, but for which it proved particularly useful, viz.:—minelaying. Two types were developed by the Germans, the short range and the distant minelayer. The former were relatively small—170 to 500 tons—with six almost vertical tubes, open at top and bottom to the sea, passing through the pressure hull at the middle line forward of the conning tower. Three mines, one above the other, were stowed per tube, each held in position by stops which could be withdrawn, thus releasing the mines. The distant type were of 1,070 tons with a large compartment at the stern for stowing 42 mines. Two horizontal tubes with water-tight doors at both ends were used for discharging each tube taking three mines in line at a time, these being forced out of the tubes by two motors, one to each tube, which drove a number of spur wheels gearing with racks on the mine sinkers. Two apertures in the stern below the outer doors allowed the mines to fall into the sea abaft the propellers. In the short-range type of minelayer the mines were inaccessible after insertion in the tubes and were always in sea water, whilst in the other type they were dry and accessible for examination and adjustment until loaded into the tubes. The two are also termed "wet" and "dry" types.

Bow torpedo tubes and guns were fitted in both types, but to provide for the space and weight of mines and tubes, the power of the engines and motors, and with it the surface and submerged speeds, were reduced as compared with the ordinary submarine. A few mine-laying submarines are attached to all navies, the largest being V-4 of the U.S. Navy, of 2,890 tons, carrying 60 mines and arranged with a mine room and tubes at the stern.

Classification.—Up to 1914 submarines were divided into two main classes or types, the general service or patrol, and the coastal. The former was of 600 to 800 tons surface displacement with good speed and endurance, and capable of detached duties at some distance from its base, whilst the coastal submarine was of 250 to 400 tons, intended primarily for the defence of naval ports and bases. During the war other types were introduced, amongst which were the following:—Fleet submarine, with a surface speed of 24 knots, to accompany the fleets, and of which the British "K" class was the only example; the cruiser submarine with good torpedo and a relatively powerful gun armament (2–150 mm.) of great endurance (18,000 miles at 8 knots), capable of detached service in distant seas, but too large and unhandy for ordinary duties, of which the German "U.140" class of 1,930 tons was the first; the minelayer submarine already referred to; the monitor submarine, of which the British "M" Class was the only example, mounting a large calibre gun arranged for rapid fire when surfacing, and which at short range was sufficient to cripple unarmoured warships; and the submarine-destroyer submarine with high submerged speed (14 to 15 knots), which, sighting an enemy submarine on the surface, would close with her at top speed submerged, and sink her before she could submerge, the only example being the British "R" Class. In addition to these, the Germans built the commercial submarine—the "Bremen" class—which was not a success. Several of these new types have disappeared or are not being repeated. A study of the submarines under construction by the naval powers indicates three distinct types The most numerous is the general service type with good surface and submerged speeds, high endurance and excellent seagoing qualities, with strong torpedo armament, but mounting one gun of 4 or 5 inches calibre, and of displacement from 900 to 1,800 tons. Few cruiser submarines are being built, almost the only example being the British "X·1" with an average torpedo armament, but with a powerful gun armament of four 5·2 inch guns. The third type is the minelaying submarine, of which the number is small compared with the general service type. (W. J. B.)

SUBMARINE CAMPAIGN. When the World War broke out the submarine was a weapon of unknown capabilities. In its legitimate rôle as one of the essential arms of a modern navy, it was not a serious menace to Great Britain, but the "unrestricted" war on commerce was, in the words of Lord Jellicoe, "the greatest peril which ever threatened the population of this country."

In Aug 1914 the British navy had some 36 submarines of varying ages, of which the old "A" and "B" class boats were fit only for harbour defence The "C" class could keep the sea for a few days and were used for defence of the Firth of Forth, mouth of the Thames, and Strait of Dover, while the "D" and "E" classes were based on Harwich and employed in keeping a close watch on the Heligoland Bight. Germany had 28 "U" boats, of which 18 were fit only for harbour defence. "U 19" to "U 28" were seagoing boats but their capabilities were then unknown either to Germany or England It was the German custom, on the rare occasions on which their fleet ventured into the North sea, to station "U" boats off the British harbours beforehand to lie in wait for her ships as they came out, but these measures met with little success. Previous to the sortie of the High Sea Fleet which ended in Jutland (*q.v.*), "U" boats were lying in wait off Scapa, Moray Firth, the Firth of Forth and the Humber from May 23 to June 1, but Admiral Scheer says "Their reports gave no enlightenment," and in fact they were actually misleading After the sortie of Aug. 18, however, "U" boats did sink the "Nottingham" and "Falmouth" on their way home. By the end of the war the Grand Fleet possessed a submarine flotilla designed to act with it as a tactical unit, but no opportunity occurred of testing its capabilities in battle.

ALLIED OPERATIONS

In addition to their patrol work in the Bight and Strait of Dover, Allied submarines were employed in the Baltic, the Marmora, the Adriatic, the Otranto barrage and the Dardanelles patrol. Owing to the mining of Danish territorial waters the Baltic was closed to the British fleet from the beginning of the war, and Germany was able to carry on her trade with Scandinavia unmolested. It was therefore decided to send British submarines into it, and on Oct. 17, 1914, "E 1" passed through the Sound, followed two days later by "E 9." Though little time remained before ice compelled the boats to cease operations for the winter, the knowledge of their presence in those waters put an end to Germany's feeling of security. With the disappearance of the ice the submarines began to make their presence felt. More boats were sent during 1915. One of them, "E 13," ran ashore in Danish territory on entering, owing to a breakdown of her compass. The Danes correctly allowed her 24 hours to endeavour to refloat, but before this interval elapsed two German destroyers arrived and, in spite of her being in Danish territorial waters, opened fire on her, killing 15 men as they swam ashore. In the autumn the boats were chiefly employed against the traffic in iron ore from Sweden to Germany, and produced a serious hold-up of that vitally important trade. They also succeeded in sinking the armoured cruiser "Prinz Adalbert," a light cruiser and a destroyer. After the Russian Revolution, when the Germans advanced on the submarine base at Helsingfors, the whole flotilla of eight boats was taken out to sea through the ice and blown up by their own crews.

The experiences of the Allied submarines during the Gallipoli campaign are among the most thrilling episodes of the war. The straits are 27 miles long and for 3·5 miles are only one mile wide. The current is swift and variable, and minefields were known to exist, but Lieut. Holbrook in "B 11" successfully passed under the mines and torpedoed the Turkish cruiser "Messudieh." On the return journey his compass became unserviceable, but in spite of all perils he returned safely and was awarded the Victoria Cross. No further attempt was made until April 1915, by which time anti-submarine nets and obstructions had been added to the defences The passage was then tried by "E 15," but unluckily she grounded some ten miles up. Being unable to get off again, she was destroyed after considerable difficulty with a torpedo dropped from a picket boat, one of two boats which crept up to the stranded submarine under cover of darkness. The next attempt, by "E 14," was successful. She sank three Turkish ships in the Marmora including a transport with 6,000 troops, but "A.E. 2" of the Australian navy was sunk by gunfire on the way up on April 30, and the French "Joule" struck a mine and was lost in May "E 11," returning from a successful trip, found a mine sitting on her bows, but got rid of it by clever manoeuvring She had penetrated as far as Constantinople itself where she torpedoed a Turkish gunboat, sank transports and storeships off Rodosto and torpedoed the "Stamboul" in the Golden Horn. This was the first time an enemy warship had appeared in those waters since the Turkish conquest. Her exploits held up all sea communication between Constantinople and Gallipoli for a time. Many boats followed, most of them meeting with considerable success, all with thrilling adventures. They attacked troops and railway lines, fought with "Q" ships and "U" boats. "E 12," returning from a 40-days' cruise, carried off part of the Nagara obstruction in passing through the nets and was dragged down to a depth of 40 fathoms before the entanglement, whatever it was, was scraped off her by a chain stretched across the straits a little lower down. Though she broke surface in her struggles and came under fire from guns and torpedoes, she managed to reach Helles in safety After the evacuation in 1915 there was no further object in sending submarines into the Marmora, and these hazardous enterprises ceased

GERMAN OPERATIONS

The Opening Phase.—The German naval authorities expected the Grand Fleet to appear in force in the Heligoland Bight immediately on the declaration of war, and had their submarines ready waiting for them As the Grand Fleet did not oblige them, ten "U" boats started on Aug. 6, 1914, to make a sweep in the North sea to try to locate it. One boat, "U 15," did so, being rammed and sunk by the "Birmingham." Eight of the others returned, and as no useful result had been obtained this plan was discontinued. Their first submarine success of the war was scored by "U 21," who torpedoed the light cruiser "Pathfinder" off St. Abb's

Head on Sept. 5; but the most important achievement of the opening phase was the torpedoing of the "Aboukir," "Cressy" and "Hogue," by "U 9," with the loss of over 1,200 men. Though the feat was an easy one, as the last two ships closed their consorts and lowered boats in the attempt to save life, its effect was to raise the submarine in the estimation of both belligerents. After a credible report that periscopes had been seen in Scapa Flow the Grand Fleet withdrew from there until the harbour had been made secure with booms and nets. In actual fact no "U" boat had so far visited Scapa, German effort having been mainly directed against the troop transports going to France. "U 20" was sighted on her way to attack a convoy of Canadian troops and was hunted so hotly that she returned to Germany by the northern route in preference to the Strait of Dover again, thus demonstrating the practicability of this route for submarines.

The "Glitra," sunk by "U 17" off Stavanger, was the first merchant ship to suffer at their hands; but losses in the channel, especially off Havre, soon led to troops being sent across only at night, in fast ships escorted by destroyers. The first shock to public sentiment was the sinking of a Belgian relief ship full of refugees in mistake for a troop transport. Though the "Hawke," "Formidable" and several smaller British men-of-war had been sunk by the end of the year, submarines had so far done little to affect the naval situation.

The Attack on Commerce.—The submarine possessed certain decided advantages over the surface vessel for commerce destruction. She could attack shipping in the congested waters around the British Isles and France without undue risk to herself and within reach of her own refuelling bases. She was comparatively cheap, and could be produced quickly in large numbers. On the other hand her use as a commerce destroyer involved total disregard for the accepted canons of naval warfare. She could neither spare men for prize crews nor send prizes into port, for to effect a capture in the legitimate way she must come to the surface and remain there long enough to incur enormous risk.

The sinking of half-a-dozen British merchant ships on Jan. 30, 1915, gave an indication, but the first official intimation was a notice published on Feb. 2 warning all peaceful shipping against approaching the coasts of Great Britain. It was followed by the celebrated memorandum of Feb. 4 proclaiming that after Feb. 18 the waters around Great Britain would be considered a military area; that every hostile merchant ship found there would be sunk without regard to the safety of passengers or crew; and that even neutral ships in that area would be in danger. Germany sought to obtain the advantages of a commercial blockade without rendering such a blockade effective according to international law.

The United States pointed out the illegality of this, but Germany suggested that the American Government might provide a naval escort for their ships. Before Feb. 18, several merchant ships were attacked in the channel and North sea. The first neutral to suffer was the Norwegian steamer "Belridge," bound from New Orleans to Amsterdam with a cargo of oil for the Dutch Government, torpedoed without warning off the Varne on Feb. 19.

Anti-submarine Measures.—Great Britain's reply to the German memorandum was the Order in Council of March 11, known as the Retaliatory Order (*see* BLOCKADE). The State insurance scheme was just as effectual in preventing panic then as it had been at the outbreak of the war, and the flow of trade was maintained. Merchant ships were advised as to what precautions to take, the best procedure when attacked and the use of wireless telegraphy. The auxiliary patrol was strengthened, till by April 30 there were, on their stations or fitting out, some 60 yachts and over 500 trawlers and drifters in addition to 400 trawlers and drifters of the mine-sweeping service. Behind the Dover minefield a line of drifters with indicator nets was maintained across the straits, supported by destroyers and armed trawlers; and the Gull Stream, the northern entrance to the Downs, was closed with a boom.

For the protection of the North Channel into the Irish sea, all shipping was restricted to the passage between Rathlin island and the mainland of Ireland, the area between Rathlin island and the Mull of Cantire being closed by nets. Lines of nets and patrol flotillas protected the southern end of the Irish sea, while important harbours and anchorages were also provided with net defences. In spite of all precautions the tale of losses continued and the range of attack increased. During March casualties were reported from all parts and every week saw two or three vessels sunk in the channel. On March 27 and 28 alone "U 28" sank four vessels in the neighbourhood of Lundy island and the Smalls, and submarines were passing down the west coast of Ireland to attack vessels in the approaches to the Channel. Nevertheless, there was little diminution in the flow of trade and the officers and men of the merchant service who ran the personal risk regarded it with superb indifference. When opportunity offered they were not slow to retaliate, as witness the ramming of "U 6" by the "Thordis" off Beachy Head.

The first 18 "U.B." boats had a surface speed of only 6·5 knots and only two torpedoes for armament. Although nets were moored off the Belgian coast (*see* BELGIAN COAST OPERATIONS) and the patrols were numerous and active, these feeble little craft fought the tide rips and navigated amongst the sandbanks of the east coast, sinking ships and raiding fishing fleets. On June 21 "U.B. 6" passed through the Dover barrage and reconnoitred Boulogne. Thence forward the Dover patrol could not keep them out. The "U.C." boats, no faster than the "U.Bs" and totally unarmed, were intended only as minelayers. Their function was to creep at night to some light-vessel or buoy and lay their mines close to it. These mines claimed many victims of all nationalities on the thickly frequented east and south coast routes. After April 10 "U" boats operated only in the North sea and western approaches. In the North sea the attack was chiefly on shipping of the Scandinavian Powers. In the western approaches three "U" boats were kept at work between Ireland and Ushant; this service absorbed nine boats, three working, three on passage and three resting.

The liner "Falaba" was torpedoed after 5 minutes' warning with a loss of 104 lives, 57 of them passengers, while the sinking of the "Lusitania" without any warning on May 7 with a loss of 1,198 men, women and children sent a thrill of horror throughout the civilized world. Two U.S. steamers, the "Gullflight" and "Nebraska," were torpedoed without warning in May, and so powerful was the feeling eventually raised in the U.S.A. that the German Government gave way and on June 5 issued orders that large passenger ships were to be spared unless they made deliberate attempts to injure submarines. American indignation flamed up anew when on Aug. 19 the White Star liner "Arabic" was torpedoed without warning with a loss of 44 lives, and to appease America fresh orders were given on Aug. 30 that no liners were to be sunk without due regard to the safety of the passengers. September saw the end of the first campaign in home waters; 166 British steamers and 168 fishing vessels had been sunk, the latter a class which by The Hague Convention should have been spared. France, Russia and Belgium had lost 34 ships between them. Of the neutrals Norway lost 51, Sweden and Denmark 15 each, Holland and Spain two each. These losses are exclusive of those due to mines, by which Holland suffered especially.

Spring Campaign of 1916.—During the winter the naval authorities in Germany managed to wring from the political heads permission to torpedo defensively armed merchant ships without warning, though passenger ships were still to be spared. In Feb. 1916 the attack began again, many more boats both of the "U" and "U.B." classes being now ready. The western approaches to the British Isles were the main theatre. On March 24 the French packet "Sussex," crowded with passengers for Dieppe, was torpedoed in spite of Germany's promise to President Wilson. The President sent what was practically an ultimatum demanding the immediate abandonment of Germany's "present methods of submarine warfare against passenger and freight carrying vessels." The German Government surrendered and at the end of April stopped this second campaign. In this three months the British lost 58 ships and fishing craft from submarines and the Norwegians eighteen. France also lost three steamers. Throughout the summer of 1916 the "U" boats took part in the operations of the High Sea Fleet, and an attack was made on the ships carrying

munitions from Great Britain to North Russia

Owing to Germany's surrender to the President's ultimatum, tension between her and America diminished, whereas the Allied blockade was bearing so heavily on American commercial classes that feeling grew very bitter against England and a strong protest was sent from the United States. Encouraged doubtless by this reversal of the situation, Germany decided to renew her war on commerce. A specially severe attack was made on Scandinavian shipping carrying iron ore, and also on ships carrying coal to France and Italy. Between Sept. 1916 and Jan. 1917 inclusive, 170 Norwegian, 29 Swedish and 50 Danish ships were destroyed by "U" boats as against 86 British sunk in home waters In September and October Norway lost 5% of her mercantile marine

The rate of sinking rose so much that Admiral Jellicoe took the unusual step of writing to the prime minister direct to call his attention to the fact that loss of shipping alone might soon force the Allies to conclude peace As a result of the conference which followed he was appointed first sea lord to carry into effect the various proposals for dealing with submarines By that time the tension between the U S. and Germany had increased again owing to the appearance of "U 53" off Nantucket where, within sight of land, she sank one Dutch, one Norwegian and three British ships

The Dardanelles campaign provided an excellent object for attack "U" boats came out from Germany and by the end of May "U 21" had sunk the "Triumph" and "Majestic" off the Peninsula and passed on up to Constantinople. "U B." and "U C." boats were sent in pieces by train from Germany to Pola where they were assembled, and by the autumn the Central Powers had five large "U" boats, four "U B." and four "U.C." boats operating in those waters Mediterranean conditions are most favourable for submarines, and the protests of President Wilson had no effect there, where the sinking of merchant vessels went on without those interruptions which cut the home waters campaign into such well defined sections In the 18 months from their arrival to the end of Jan. 1917 a total of 200 British, 189 Italian and 52 French ships were destroyed by them Contrary to Admiral Scheer's wishes the autumn campaign of 1916 was conducted under certain restrictions with regard to passenger ships and sinking without warning in home waters Only reluctantly had he allowed his High Sea Fleet submarines to participate, but the results exceeded anticipation In October 148,000 tons of British and 164,000 tons of foreign shipping were destroyed, a total of over 300,000 tons for all the nations of the world

Shipping Destroyed by Submarines

	Dec. 1916		Jan 1917.	
	Ships	Gross tons	Ships	Gross tons
British	39	110,160	51	111,974
Allies	58	66,690	63	58,253
Norwegian	32	43,537	34	55,487
Danish	17	16,113	13	17,151
Other Neutrals	21	39,900	19	42,142
Totals	167	276,400	180	285,007

The favourable results of this campaign, limited though it was, strengthened the case for the advocates of unrestricted warfare. They argued that if all restrictions were removed the rate of destruction would be doubled, and Britain would be brought to her knees before America would have time to intervene effectively. Their arguments carried the day

THE FINAL STRUGGLE

The Second "Unrestricted" Campaign.—On Feb. 1, 1917, unrestricted warfare was recommenced, Germany declaring the areas enclosing the British Isles and France to be war zones, also the Mediterranean. The Portuguese Atlantic islands and the area around Archangel were added later. Vessels of any nationality or character found in the war zones were to be destroyed, and consideration for the safety of the lives of the seamen on board these vessels was not to be allowed to hinder the submarines at their work. To carry on this campaign Germany had 111 sea-going submarines of the "U," "U.B." and "U.C." classes. Though the "U.C" class were still primarily minelayers, they now carried guns and a few torpedoes, and were capable of any form of attack. Even with the reduction of traffic resulting from the natural reluctance of neutrals to enter the war zones the losses increased rapidly

1917 Losses

	February.		March.		April.	
	Ships	Gross tons.	Ships.	Gross tons	Ships.	Gross tons
British	114	260,000	146	287,000	196	522,000
Allies	77	77,000	114	115,000	108	145,000
Neutral	69	132,000	78	122,000	126	185,000
Totals	260	469,000	338	524,000	430	852,000

From this great increase in the rate of destruction it appeared that the submarines would win the war for Germany They were being built faster than they were being destroyed; from 111 on Feb 10 they increased to 127 on April 10, and it was clear the existing methods of dealing with them were insufficient. On April 19, the worst day for Britain of that worst month, 11 British merchant vessels and eight fishing vessels were sunk by them. One out of every four vessels that left the British Isles in that month never returned

Convoy System (*see* CONVOY).—It was obvious that unless some new and effective form of defence could be devised the defeat of the Allies was in sight The convoy system which had been used in the old wars seemed to present such great difficulties that it was at first considered impracticable except for the export of coal to France This latter traffic was maintained very successfully in small slow ships escorted by trawlers. Owing to their enormous losses Scandinavian vessels at length had to be collected into convoys and guarded by such armed vessels as could be spared These convoys also proved successful, and the system was introduced on other routes as escorting craft became available Experience proving that the difficulties, though great, had been overestimated, the convoy system became universal In May 1917 submarines sank 303 vessels of all nationalities, totalling 550,000 tons, by November the losses had fallen to 116 ships, totalling 259,000 tons. As the losses in shipping decreased the destruction of submarines increased; in April, May and June of 1917 12 boats were destroyed, in the next three months 20, and in the last quarter twenty-four. One of those destroyed was "U 88," sunk by the "Q" ship "Stonecrop," and commanded by the notorious Schwieger who had sunk the "Lusitania" The resumption of the unrestricted war on commerce brought the United States into the war in April 1917, and by the end of the year they had sent 37 destroyers to assist in convoy work.

The Attack Defeated.—As 1917 progressed it became increasingly clear that the submarine attack on commerce had been countered. The number of "U" boats in commission reached its maximum of 140 in October and then slowly diminished. They failed to impede either the transport of British troops to France or of American troops to Europe. Four of the best "U" boats were sent across the Atlantic especially to attack troop transports Between them they destroyed 60 ships, but not one which carried troops. One of them, "U 156," was lost in the great minefield laid across the North sea. During April 1917 submarines sunk 840,000 tons of British and Allied merchant ships and fishing vessels. Merchant ship-building in Great Britain had been practically suspended in order to provide for the requirements of the navy and army. Her skilled engineers and shipwrights were mostly at the front and could neither be recalled nor replaced. Her total output for the month was only 67,536 tons gross, and continuance of these conditions would soon have brought about Allied defeat; but from that date, due to the introduction of the convoy system, the sinkings decreased, and the efforts of the Ministry of Shipping increased output to such an extent that by Oct. 1918 it had overtaken the rate of Allied losses. The Flanders bases had to be evacuated and the submarines in them blown up

—all except "U.B. 116," whose commander, Lieut. Emsmann, made one last effort. He reached the entrance to Scapa Flow on October 28, but the boat was picked up by a searchlight and sunk. At the armistice 138 boats were surrendered and brought to Harwich. (*See* also BLOCKADE and CONVOY.)

SUBNORMAL AND FEEBLE-MINDED, EDUCATION OF. The mentally handicapped are most frequently thought of as those who, because of failure of development of the brain, cannot carry out the activities which are considered normal. Especially because of the finding of developmental defects of the brain, there is a tendency on the part of pathologists to consider some of the mentally handicapped to be essentially different from the normal. On the other hand there are equally cogent reasons for the belief that from the lowest to the highest degree of intelligence there may be an unbroken line. For purposes of convenience we may be justified in isolating mentalities into groups, but we must not forget that the groups are contiguous, and even overlapping.

Method of Classification.—The most convenient method of classification of the mentally handicapped is by comparison with average mentalities of children. If a 20-year old boy knows and can do only those things which are known and done by children of 16 years or over he is considered normal; if he can suitably adjust himself only to those things known ordinarily to and appropriately reacted upon by a two-year old child he is known as an idiot; if he knows and acts as an average child from three to seven years of age, he is considered an imbecile; and if his knowledge and reactions resemble those of an eight to nine-year old child he is spoken of as a moron. These divisions, it will be noted, are artificial limitations in that (1) they take a positive view of the "average" intelligence, (2) they are based on "abstract" knowledge or social behaviour, or on both; and (3) they do not take into account special aptitudes or capabilities.

The acquisition of modes of behaviour other than those of a fixed reflex character is a characteristic of normal development. As development proceeds and the child has new experiences the adjustments become more complex. In the lowest form of feeble mindedness, idiocy, there is a retention of the infantile reflex activities without the acquisition of more than the simplest modifications of the reflexes. The idiot is helpless, he does not control his physiological functions, he cries and he makes inarticulate sounds. A few idiots learn to feed themselves and occasionally to select their food, but many will eat whatever comes to hand,—earth, lime, wood, cloth, etc. The imbecile adds to the advanced learning of the idiot the activities of play, the performance of simple home duties and sometimes the ability to read and to write short sentences, as well as consecutive, though limited, vocal speech. The moron can be taught to carry on without immediate supervision operations such as digging, cultivating land, simple carpentering, driving a horse or automobile; he does housework well and he has some social characteristics of co-operation in group activities. He can learn to read simple books and he can talk on ordinary every-day topics. Notwithstanding the limitations expressed above, it is not unusual to find some feeble-minded who far surpass the performances of normal or even mentally superior persons because of special aptitudes. Thus, an "imbecile" who had not learned to read or write was able to give accurately the day of the week for any date in the past century. Another was able to multiply "mentally" four- or six-place numbers in less time than most normal persons could do with pencil and paper.

These deviations in capability, especially the limitations, of the feeble-minded make their educational training both simpler and more tedious than the educational handling of the normal child. The simple character of their accomplishments makes for ease of instruction; their slowness of learning makes their instruction tedious, irksome and monotonous. An unwearying drill master is usually required, and because of this many of the higher grade feeble-minded become excellent teachers for the routine training of those who are of lower intellectual grade. A feeble-minded child may attain a three-year mental level by the age of four, but although he may continue to develop mentally he does so only slowly. At the age of 12 he may attain the normal six-year level. In cases of this kind, which with different age figures are very common among the school population, the slow learning leaves the feeble-minded almost unaffected intellectually by the mass instruction in our public school systems. Each day's work is planned for the average child, and is too great for the retarded child to assimilate. The more rapid learning of the normal children may, on the one hand, tend to discourage the feeble-minded if the latter have sufficient mentality to be affected by a recognition of their own deficiency. It may even bring about resentment and bad-temper.

Advantages of Special Classes.—There are well-recognized advantages in special classes for the feeble-minded both for them and for normal children. The normal is not held back by the retarded, and the instruction of the feeble-minded can be adapted to their degree of development. Because of this, many school systems have organized departments for their special care. It is also recognized that the public schools can care for those who have social characteristics, but not for those who are idiots or low grade imbeciles. The latter groups must be cared for in special institu-

tions, or in their own homes when institutional care is wanting or when parental prejudice prevents separation from the family group. Special classes and institutions are best adapted to the education of practically all feeble-minded, both because of the provision of interested and trained teachers, and because of special curricula—the direction of school energies towards the adaptation of their charges in social directions which are commensurate with the pupils' potential mental development. Special training makes for individual happiness and for social welfare. When the feeble-minded are not pushed into intellectual and manual work beyond their capabilities, there is less tendency to personal conflict, and at the same time the pupils can be trained in those relatively simple activities for which greater mentality is a handicap.

Much, nearly all, of the education of the feeble-minded should be motor. It should be a training in behaviour directed to those occupations which require little judgment and little analysis, viz., those which are routine. Most factories and shops have work which can be done best by the routine worker, who may become self-supporting In and around homes and hotels many household duties can be carried out successfully and with little supervision by those of little intelligence if they are given suitable training. These jobs should be selected in accordance with the physical make-up and interests of the individual, and in conformity with his home situation. Except with respect to the lower grades of the feeble-minded the schools should not neglect the matter of instruction in reading, writing and simple arithmetic, because simple attainments in these lines are fundamental to practically every occupation. The latter warning may appear superfluous, because in some quarters there is a tendency to try to develop to the highest degree the intellectual side of every individual, regardless of the difficulty or the ultimate value A further effort to make the feeble-minded a part of society is being made in some communities by having after-care or supervision after school training. This excellent procedure insures a close co-operation between the school and the community in the solution of one aspect of the problem of feeble-mindedness, and it achieves a better result for the individual as well as for society. Because all grades of the educable feeble-minded are chronologically and physically older than the normal children with whom they may be instructed, they are apt to be detrimental to the latter. Their greater physical development, coupled with their lack of judgment, result in oppression or physical danger to the normal, younger and weaker children. Because of their greater physiological development they may prove a moral menace Because of their less controlled emotional reactions they sometimes become brutal or bestial after the onset of puberty. It is because of an individualistic development that the feeble-minded may readily be led into careers of crime. The lack of inhibition coupled with sex impulses leads also to sexual abnormalities. Both of these results are unsocial or antisocial. *See* also MENTAL DEFICIENCY.

SUBOTICA, a town of the Voivodina, Yugoslavia. Pop. (1921) 101,857 It is the centre of an immense agricultural district, and in the adjoining territory of Puszta Telecska (369 sq m) large herds of cattle are reared. The chief industries are the making of iron articles of furniture, railway trucks and boots. Lake Palics near by is a favourite watering place and summer resort.

SUBSTANCE. The concept of substance is that of a permanent substratum preserved through all changes. The term substance is Latin for the Greek ὑποκείμενον, "that which underlies," as the permanent "basis" of its "accidents" (*συμβεβηκότα, e.g.,* Aristotle, *Metaphysics* IV, 30, 1025a)

Greek Philosophy.—To set forth this permanent Being which in all transformations remains identical, was conceived by Greek philosophy from first to last as one of its principal tasks Greek Philosophy is essentially "ontology"; it aims at the determination of "Being as such" (*ὂν ᾗ ὄν*; Aristotle, *Metaphysics,* 1, 2). In the characterization of this Being lies the difference between the various schools of Greek thought In the natural philosophy of the Ionians it is first conceived as *material* Being; substance is the basic matter from which all other materials have issued. It designates, accordingly, the "beginning" of all becoming at large and, at the same time, an immutable unit, a uniform and constant "nature" (*μία τις φύσις*), which is neither subject to nor affected by becoming

But already in the next phase of Greek Philosophy, Heraclitus and the Pythagoreans replaced this material determination of substance by another type of determination. For them, the permanent consists not in an unchangeable material substratum, but in certain constant *proportions* which persist in all Becoming. The true substance, the "essence" (*οὐσία*) of things is not sought in an individual thing, but, according to the Pythagoreans, in *Number,* this being the principle underlying all measured proportions; according to Heraclitus in the immanent law, in the "Logos" that governs all events and retains them within definite limits. Here substance does not lie outside Becoming, but designates a law which pervades all Becoming and gives it its "form." This view forms the transition from the "physical" explanation of things to their "ideal," *i e*, mathematical and logical, explanation The logical view of substance was developed by Parmenides and the Eleatic school. True "Being" can be grasped only in pure *thought.* Thinking and Being are one; so, true Being is determinable only by predicates of thought It is eternal; it is subject to no change of place; it is one and admits of no partition.

This idea of logical identity becomes the determining motive in the further development of the concept of substance in Greek philosophy.

The systems of the "younger philosophy of nature" (Empedocles, Anaxagoras, Democritus) attempt to connect and reconcile this motive with the physical explanation of the universe They seek to exhibit within nature itself certain elements which, although themselves incapable of change, produce, by their mutual relationships, the manifold of reality and their changes.

Atomism, especially, became of fundamental importance for the further development of the concept of Substance. The idea of the absolute oneness of Substance is here abandoned; true substantiality is attributed to atoms which are infinite in number, but simple and indestructible From the differences of position, shape, arrangement and spatial motion of the atoms results the manifold of sensible phenomena, which accordingly possess only secondary Being; genuine Being is attributable only to the atoms and to empty space, which is required for their motion

The classical systems of Greek philosophy, however, effect a decisive change. Instead of matter, pure *form* is made the basis of all substantiality. The form (*εἶδος, ἰδέα*) is the one persistent element; unlike sensible phenomena which always "become" and never "are," it remains the same. Equal *things* can become unequal, the small, by growing, can become large; but the *idea* of the equal, etc., remains what it is and suffers no change (Plato, *Phaidon* 99 *sqq.*). Thus, the idea forms that which alone has genuine, constant, true Being (*ὄντως ὄν*), while empirical objects, in so far as they have Being owe this to their "participation" in ideas. In the system of Aristotle, too, this interpretation of the problem of substance is retained, although he rejects the substantiality of pure ideas as taught by Plato For him, substance is the individual Being composed of "matter" and "form" But the specific function of determination belongs to the form: Logically substance is the ultimate "subject" of all predication, but which cannot be predicated of anything else. All our judgments refer to a Something of which they claim to be true; and this Something is that to which the judgment refers (Aristotle, *Categ.* V, *Metaphysics,* 1069a 18). From this "first substance" (*πρώτη οὐσία*), Aristotle distinguishes the species and genera as "substances of the second degree" (*δεύτεραι οὐσίαι*). They do not subsist in themselves, but only in the individual beings, the first substances; but they express the most general determinations without which individual beings could not be thought.

Descartes, etc.—The Aristotelian conception of substance determined for many centuries the form of western thought and metaphysics. Mediaeval Scholasticism was in its essence a philosophy of "substantial forms." This fundamental outlook was shaken only by the new scientific view of the world, which origi-

nated in the 17th century. The establishment of the helio-centric system by Copernicus and Kepler, and of modern dynamics by Galilei, deprived the Aristotelian physics, cosmology, and metaphysics, of their foundation. The new concept of substance goes back historically to pre-Aristotelian philosophy, especially to the doctrines of the Pythagoreans and of Democritus. Substance is now conceived *mathematically;* it is that which, in all transformations of phenomena, remains unchangeable in *magnitude*.

Thus, the problem of substance, or matter, is supplemented by the problem of *motion*. For also motion, now conceived as pure translocation, reveals a *quantitative constancy* which makes it something substantial. In this sense, the Galilean doctrine of motion is headed by the principal of inertia, *i.e.*, the theorem that the motion of a material point upon which no external forces are working, remains invariant in velocity and direction. Similarly, the mechanics of Descartes rests on the principle of the "preservation of motion," *i.e.*, the assumption that the so-called magnitude of motion, which is measured by the product of mass and velocity (*mv*), can suffer neither increase nor diminution. This product remains constant in the whole world; through the exchange of velocity, which takes place at the impact of bodies, no new quantity of motion can be created nor any existing one be destroyed; there occurs only a change in the *distribution*.

From this assumption, however, it follows that the world of bodies is a system completely closed in itself and incapable of suffering any interference from the outside. All action of body upon body, all "causality" within the realm of extension, rests upon mechanical laws; mental, "immaterial" powers cannot act upon bodies, nor increase or diminish the sum total of their momentum. Between the worlds of "external" and "internal" experience, between "matter" and "consciousness," no kind of transition takes place.

Through this viewpoint, the metaphysical doctrine of substance receives a decisive turn. Descartes defines substance (*Principia philosophae,* I. 50) as that type of thing which exists in such a way that it needs no other thing for its existence. Accordingly, the concept of substance is applicable only to the Being of God. Next to it, there subsist, as *relatively* independent and mutually irreducible entities, consciousness and the world of bodies. The fundamental problem consists now in determining how these two essentially different substances can enter that kind of *connection* which is exhibited in the concrete existence of man. For man is a whole consisting of "thought" and "extension," of "soul" and "body." The search for an explanation of the *empirical* union of soul and body, notwithstanding their metaphysical difference, gives rise to the systems of Spinozism, of Occasionalism, and of the doctrine of monads.

Locke and Hume.—A new and decisive turn is given to the problem by the *critical analysis of cognition* which starts with Locke and Hume and reaches its completion in Kant. The characteristic of this turn lies in the fact that the weight of the problem is transferred from the realm of metaphysics to that of epistemology. Substance appears as a "category," as a fundamental concept of pure understanding. That this concept is not *derivable* directly from experience, that it cannot be thought as the mere "copy" of a sense-impression: this is emphasised also by Locke and Hume.

The empiricist and sensualist conception of knowledge, which they represent, is thus confronted with the question whether the concept of substance, not being reducible to empirical sources, retains any "objective" *significance* or is merely *"subjective"* as a kind of natural illusion of the human understanding. Locke starts with the assumption that true reality belongs only to the simple, sensible "ideas," to the sensations of colour, sound, etc., whereas the understanding cannot create any new reality, but can merely connect these ideas in certain modes with one another. Such a mode of connection is represented by the concept of substance. What the senses deliver individually, is thereby connected; the changing states and properties being united in one "substratum," or "bearer." But the idea of a persistent thing as "bearer" of the changeable qualities is, in itself, utterly empty; it represents a mere form of knowledge to which no content corresponds. Not adding anything new to the sensible elements in which all our knowledge of reality is rooted, it originates in the mere habit of correlating with one another many such elements on the basis of their regular conjunction, their spatial coexistence.

This correlation, however, is not a real, objectively founded *connection.* We know, for instance, that in the thing commonly called by the name of "gold," a certain density, a certain colour, a certain specific weight, etc., appear regularly in conjunction; but the *necessity* of this conjunction, the "ground" for the combination of the various qualities in *this,* and no other, mode, is not understood. Even if there be such a ground in reality, it must be undiscoverable and unintelligible. (Locke, *Essay on the Human Understanding.*) The subjective nature of substance is emphasized even more by Hume.

The concept of substance, according to Hume (*Treatise on Human Nature*), is not reducible to any sense impression; it has, therefore, no positive significance for knowledge, but is merely a product of the imaginative power which combines what is frequently together, into *one* idea and gives it *one* name. This criticism of the concept of substance refers to the realm of external as well as of internal experience. The supposition that a material *thing* as such persists even when not perceived is denied objective significance; and the concept of "soul-substance" is rejected and the "I" declared a mere "bundle of perceptions."

Kant.—Kant's *Critique of Pure Reason* takes up the results of Locke and Hume; but it draws from them an entirely different *epistemological* conclusion. For Kant, too, substance is a pure concept of understanding; a form of connection established by pure thought. But this form of connection cannot be reduced to the *empirical* rules of habit and association; it has universal and necessary validity; it is a *synthesis a priori.* The validity of this synthesis consists in the fact that it is the basis of experience itself. Without the idea of a Something persisting in the stream of appearances, it would be impossible to establish and to make intelligible that *order* of phenomena which we conceive under the name of "experience."

The proof, the "transcendental deduction" of the concept of substance is, accordingly, presented by exhibiting it as a constitutive condition of any possible experience. This implies, on the one hand, that it is indispensable for all experience, for all scientific cognition of nature; on the other hand, that it is designed for use in experience only, that its validity does not refer to "things-in-themselves" but to phenomena. The principle of substance, according to Kant, belongs to the "analogies of experience," *i.e.*, to those principles on the basis of which alone it is possible to set a fixed, objective *time-relation* between phenomena and to conceive them as "nature" coherent in itself and ordered according to universal laws. Such an objectivation of time would be impossible without the category of substance. "The persistent is the *substratum* of the empirical notion of time itself, and it is on its basis alone that all temporal determination is possible." For change does not affect time itself, but only its contents, only the concrete events which we conceive as following each other in time. Time itself does not change, but all change occurs in it as the "constant corollary of all Being of phenomena." However, the strictly "empty" time does not constitute any possible object of perception; in order to think of time as constant, as "duration," we must, therefore, presuppose a persistent element within appearance itself and oppose it to all that is merely changeable.

The concept of something persistent is, accordingly, "the condition of the possibility of all synthetic unity of perceptions, *i.e.*, of experience; and in proportion to this persistent element, all being and all change in time can be viewed only as a modus of the existence of that which remains and persists." (*Kritik der reinen Vernunft,* 2nd. ed.; p. 225 *seq.*)

Recent Epistemology.—The contrast between Hume's and Kant's conceptions of substance, reappears in the recent epistemology. The further pursuit of the road of Hume leads to empiricism and positivism; the further pursuit of the road of Kant, to logical idealism. For positivist epistemology as developed in Avenarius' *Kritik der reinen Erfahrung* (1888–90) and in the writings of Ernst Mach (*Beiträge zur Analyse der Empfindungen,*

1886; *Die Mechanik in ihrer Entwicklung*, 1883; *Prinzipien der Wärmelehre*, 1896), the concept of substance has an essentially *biological* significance. It serves the "economy of thought" inasmuch as it is a means of correlating a multiplicity of experiences, and giving them *one* name.

But the unity of substance is a merely nominal unity. What we call material substance, is only "a relatively constant sum of sensations of touch and light associated with sensations of space and time." This constancy can never be considered absolute, only relative, so that the identity of the "thing" is a mere function. In the place of the substantial identity of things we must set the constancy of certain relations, especially of mathematical relations. "A body consists in the fulfillment of certain equations which obtain between sensible elements. These equations are the truly constant element." (*See* CATEGORY)

Critical idealism essentially agrees with this result, but differs from empiricism and positivism in the *explanation* which it gives. It, too, emphasises the fact that, the further the scientific cognition of nature progresses, the more the concepts of *things* are replaced by concepts of *relations* The concept of substance resolves into the concept of function. But the concept of function is not considered as the expression of a mere "togetherness" of experienced facts, but as a genuine achievement of thought. It is the original form of connection as such, and of experience itself. The concept of substance, is, therefore, to be replaced ultimately by that of *invariance* The whole of experience is never a mere aggregate of perceptual data linked up by purely external, habitual associations, but is organized and unified according to definite theoretical viewpoints. Without such viewpoints, no single predication of fact, especially no kind of exact measurement, would be possible. (Ernst Cassirer, *Substance and Function*, 1923) (E. Cr)

SUBSTITUTIONS: *see* GROUPS.

SUBWAY, a subsurface passage The term is generally used in America in connection with urban underground electric transportation to represent a railway operating either in a tube, a steel framework built in an open cut and then covered, or in any other type of tunnel. *See* ELECTRIC RAILWAYS; TUBE RAILWAYS, AND TUNNEL.

SUCCESSION: *see* LAWS OF SUCCESSION

SUCCESSION DUTY. In the English fiscal system, a tax placed on the gratuitous acquisition of property which passes on the death of any person, by means of a transfer from one person to another person (*See* LEGACY DUTY and SUCCESSION DUTIES)

SUCCESSOR STATE, a term applied to a State formed wholly or partly out of another State which has ceased to exist, thus forming a wholly distinct political entity, but inheriting certain obligations, *e.g.*, the repayment of a public debt, inherent in its origin. As neither Turkey nor Russia have ceased to exist, although their forms of State have changed, the only modern States to which this term can strictly be applied are those which the Treaties of St. Germain and Trianon describe as "States to which territory of the former Austro-Hungarian Monarchy is transferred and States arising from the dismemberment of that Monarchy." These States were taken by the authors of the above treaties to be Czechoslovakia, Poland, Rumania and Yugoslavia East Galicia, which, like these four States, had been recognized as its successor by the Austrian "Liquidierungskabinett" of Oct. 1918, failed to maintain its existence, and the plea of the Austrian republic to be considered a Successor State was rejected by the Powers at St. Germain, who affirmed its identity with the old Austria. The Successor States were acquitted of moral identity with the old monarchy, and were thus not called on to pay reparations, but were required instead to pay "contributions towards the Allied cost of liberation" on a scale based on pre-war taxation. Among other obligations was the signing of the Minorities Treaties. Italy signed no Minorities Treaty, but consented to regulate the financial position of the territories which she had inherited from Austria and Hungary on a basis similar to that taken for the Successor States. Among Italy, Austria and Hungary, the equitable partition of both the assets and the liabilities of the old Austro-Hungarian Monarchy led to various clauses in the peace treaties, followed by international commissions and conferences

SUCCINIC ACID is an organic compound occurring in amber (3 to 4%), from which fossilised gum it is obtained by distillation. It is also found in other resins, in lignites, in fossilised woods and in many plants belonging to the Compositae and Papaveraceae. It occurs in the animal kingdom, as in the thymus gland of calves and in the spleen of cattle

Chemically, succinic acid or ethylenesuccinic acid,

$$CO_2H{\cdot}CH_2\,CH_2{\cdot}CO_2H,$$

is a saturated dibasic acid which crystallises in colourless prisms or plates melting at 186° C, and boiling at 235° C. Its vapour readily loses water to form succinic anhydride (I.) which crystallises in plates melting at 120° C.

(I)

(II)

(III)

The acid itself is soluble in water and its salts with the alkali and alkaline-earth metals are also soluble in water Barium succinate is precipitated from aqueous solution by alcohol; ferric succinate is insoluble in water and is sometimes employed in the analytical separation of iron from other metals. When heated with phosphorus trisulphide, sodium succinate yields thiophen.

Succinic acid is produced during the bacterial fermentation of ammonium tartrate or calcium malate. It arises from the oxidation of fats and fatty acids by nitric acid. It may be prepared synthetically from ethylene, C_2H_4, through ethylene dichloride, $C_2H_4Cl_2$, ethylene dicyanide or succinonitrile, $C_2H_4(CN)_2$. The last compound yields the acid on hydrolysis Maleic acid, now produced industrially by the catalytic oxidation of benzene, yields succinic acid on reduction with sodium amalgam.

Succinyl chloride (formula II) is obtained by the interaction of phosphorus pentachloride and succinic acid. *Succinic anhydride* (formula I), also produced by heating the acid or its salts with acetic anhydride or by heating succinyl chloride with anhydrous oxalic acid, is employed as an intermediate in colour making, when it yields two brands of Rhodamine S (*see* DYES, SYNTHETIC) by condensation with dimethyl- or diethyl-*meta*-aminophenol, $NR_2{\cdot}C_6H_4\,OH$.

Succinimide (formula III), produced by heating succinic anhydride in ammonia, crystallises in colourless octahedra melting at 125–126° C, and readily soluble in water. This imide when distilled with zinc dust furnishes pyrrole (*q v.*).

Succinonitrile, $CN\,CH_2\,CH_2{\cdot}CN$, obtained as above and also by electrolysis of potassium cyanoacetate, is a colourless solid melting at 54°–55° C On reduction with sodium and alcohol it is converted into the ptomaine alkaloid, putrescine (tetramethylenediamine), $NH_2\,[CH_2]_4\,NH_2$, and into pyrollidine (tetrahydropyrrole, *see* PYRROLE).

Methylsuccinic acid or pyrotartaric acid,

$$CO_2H\,CH_2\,CH(CH_3){\cdot}CO_2H,$$

formed during dry distillation of tartaric acid, by heating pyruvic acid with concentrated hydrochloric acid, or by the reduction with sodium amalgam of citraconic and mesaconic acids, is obtained in colourless prismatic crystals soluble in water and melting at 112° C It forms an anhydride and its sodium salt heated with phosphorus trisulphide yields β-methylthiophen *Isosuccinic acid* (ethylidenesuccinic acid), $CH_3{\cdot}CH(CO_2H)_2$, an isomeride of ordinary succinic acid, is obtained on hydrolysing α-cyanopropionic acid, $CH_3{\cdot}CH(CN){\cdot}CO_2H$, or by the action of methyl iodide on ethyl sodio-malonate, $CHNa(CO_2\,C_2H_5)_2$. It crystallises in prisms melting at 120° C, and soluble in water. Unlike ordinary succinic acid, it does not yield an anhydride on heating, but loses carbon dioxide and passes into propionic acid Reference: T. E. Thorpe, *Dictionary of Applied Chemistry*, Vol VI., 1926. (G. T. M.)

SUCEAVA, a town of the Bukovina, Rumania, on the river Suceava. Pop. (1928), 11,300. It was from 1401 the seat of the

metropolitan of Moldavia and until 1565 the capital; its 14th century church contains the grave of the patron saint of the Bukovina. It was many times besieged by Poles, Hungarians, Tatars and Turks, and also suffered in the World War. Near by is the early 17th century monastery of Dragomirna in the Byzantine style.

SUCHET, LOUIS GABRIEL, Duc d'Albufera da Valencia (1770–1826), marshal of France, one of the most brilliant of Napoleon's generals, was the son of a silk manufacturer at Lyons, where he was born on March 2, 1770. As *chef de bataillon* he was present at the siege of Toulon in 1793, where he took General O'Hara prisoner. During the Italian campaign of 1796 he was severely wounded at Cerea on Oct. 11. After serving under Joubert in Tirol in 1797, and also in Switzerland under Brune in 1797–98, he was made chief of the staff to Brune, and restored the efficiency and discipline of the army in Italy. In July 1799 he was made general of division and chief of staff to Joubert in Italy, and was in 1800 named by Masséna his second in command. His action contributed to the success of Napoleon's crossing the Alps, which culminated in the battle of Marengo on the 14th of June. In the campaigns of 1805 and 1806 he greatly increased his reputation at Austerlitz, Saalfeld, Jena, Pultusk and Ostrolenka. He obtained the title of count on March 19, 1808, married Mlle. de Saint Joseph, a niece of Joseph Bonaparte's wife, and soon afterwards was ordered to Spain. Here he was commander of the army of Aragon and governor of the province, which in two years he brought into complete submission. He annihilated the army of Blake at Maria on June 14, 1809, and on April 22, 1810, defeated O'Donnell at Lerida. Suchet, now a marshal of France, in 1812 conquered Valencia, and received the title of duc d'Albufera da Valencia (1812). When the tide set against the French Suchet defended his conquests step by step till compelled to retire into France, after which he took part in Soult's defensive campaign. By Louis XVIII. he was made a peer of France, but, having rallied to Napoleon during the Hundred Days, he was deprived of his peerage in 1815. He died near Marseilles on Jan. 3, 1826. Suchet left unfinished *Mémoires* dealing with the Peninsular War; these were printed by St. Cyr-Nogués in 1829–34.

See C. H. Barault-Roullon, *Le Maréchal Suchet* (Paris, 1854); Choumara, *Considerations militaires sur les mémoires du Maréchal Suchet* (1840). *See* also bibliography in article Peninsular War.

SU-CHOW, formerly Tsin-tsuan-tsiun, a free city in the province of Kansu, just within the extreme north-west angle of the Great Wall, near the gate of jade. It was completely destroyed by the Mohammedan or Dungan rising (1865–72), but it was recovered by the Chinese in 1873 and has been rebuilt. The neighbourhood is very fertile; rice, wheat, maize, melons, rhubarb, etc., are grown in large quantities. (*See* Soo-Chow; Sui-Fu.)

SUCKLING, SIR JOHN (1609–1642), English poet, was born at Whitton, in the parish of Twickenham, Middlesex, and baptized there on Feb. 10, 1609. His father, Sir John Suckling (1569–1627), had been knighted by James I. and was successively master of requests, comptroller of the household and secretary of state. He amassed a considerable fortune, of which the poet became master at the age of eighteen. He was sent to Trinity College, Cambridge, in 1623, and was entered at Gray's Inn in 1627. He was intimate with Thomas Carew, Richard Lovelace, Thomas Nabbes and especially with John Hales and Sir William Davenant, who furnished John Aubrey with information about his friend. In 1628 he left London to travel in France and Italy, returning, however, before the autumn of 1630, when he was knighted. In 1631 he volunteered under Gustavus Adolphus and was present at the battle of Breitenfeld and in many sieges. He returned in May, 1632. He was handsome, rich and generous; the best cardplayer and best bowler at court; with a gift for verse. In 1634 he was beaten by Sir John Digby, a rival suitor of the daughter of Sir John Willoughby. Under the proclamation of 1632 against absentee landlordism, enforced by the Star Chamber, he retired to his estates in 1635. This leisure resulted in *A Sessions of the Poets* (ms. 1637) and a tract on Socinianism entitled *An Account of Religion by Reason* (pr. 1646). Suckling applied to his dramas the accessories of the masque. His *Aglaura* (pr. 1638) was produced at his own expense with elaborate scenery. Other plays are *The Goblins* (1638), *Brennoralt, or the Discontented Colonel* (1639) and *The Sad One,* left unfinished at the outbreak of the Civil War.

Suckling forthwith raised a troop of a hundred horse, at a cost of £12,000, and accompanied Charles on the Scottish expedition of 1639. He shared in the earl of Holland's retreat before Duns, and was ridiculed in an amusing ballad (pr. 1656), in *Musarum deliciae.* He was elected for Bramber (1640) to the Long Parliament; and wrote to Henry Jermyn, afterwards earl of St. Albans, advising the king to disconcert the opposition leaders by making more concessions than they asked for. In May 1641 he conspired to rescue Strafford from the Tower and to bring in French troops. The plot was exposed, and Suckling fled beyond the seas. Aubrey's statement that he took poison in May or June 1642 in fear of poverty is generally accepted. Suckling's minor pieces have at times exquisite felicity of expression. "Easy, natural Suckling," is Millamant's comment in Congreve's *Way of the World* (Act iv., sc. i.). Among the best known are the "Ballade upon a Wedding," on the marriage of Roger Boyle, afterwards earl of Orrery, and Lady Margaret Howard, "I prithee, send me back my heart," "Out upon it, I have loved three whole days together" and "Why so pale and wan, fond lover?" from *Aglaura.* "A Sessions of the Poets," describing a meeting of the contemporary versifiers under the presidency of Apollo to decide who should wear the laurel wreath, is the prototype of many later satires.

A collection of Suckling's poems was first published in 1646 as *Fragmenta aurea.* The so-called *Selections* (1836), published by the Rev. Alfred Inigo Suckling, author of the *History and Antiquities of Suffolk* (1846–48), with *Memoirs* based on original authorities and a portrait after Van Dyck, is really a complete edition of his works, of which W. C. Hazlitt's edition (1874; revised ed., 1892) is little more than a reprint with some additions. *The Poems and Songs of Sir John Suckling,* edited by John Gray and decorated with woodcut border and initials by Charles Ricketts, was artistically printed at the Ballantyne Press in 1896. In 1910 Suckling's works in prose and verse were edited by A. Hamilton Thompson. For anecdotes of Suckling's life *see* John Aubrey's *Brief Lives* (Clarendon Press ed., ii. 242).

SUCRE, ANTONIO JOSÉ DE (1795–1830), was born on Feb. 3, 1795, at Cumuná, Venezuela, where his family had for generations held a position of importance. He had only a meagre education and turned early to the profession of arms. In 1811 he was placed in charge of the republican engineers at Margarita, with the rank of lieutenant. In 1821 he acted as Bolívar's agent in the campaign against Spain in the presidency of Quito. There in 1822 he defeated the Spanish forces at the battle of Pichincha which definitely ended the power of Spain in that province. In March 1823, Perú accepted Bolívar's offer of services in her struggle for independence, and a month later Sucre went to Lima as Colombia's commissioner. Bolívar arrived at Callao on Sept. 1, and was appointed by congress to the command of the patriot forces. During the preliminary stages of organization Sucre served as Bolívar's lieutenant. In Feb. 1824, Spanish troops re-occupied Lima. Congress immediately declared Bolívar "supreme political chief"; and he in turn placed Sucre in command of his troops.

At the end of July 1824, the army which Bolívar had been organizing gathered near Lake Reyes in the Peruvian uplands, and on Aug. 6, Sucre defeated the Spanish army under Canterac in the battle of Junín. Withdrawing to Cuzco, Canterac waited for additional troops, and then marched upon Sucre. After two months of manoeuvring, Sucre, on Dec. 9, faced the combined forces of Spain under Viceroy La Serna on the plain of Ayacucho and utterly routed them. After the battle Sucre and Canterac signed a treaty of capitulation arranging for the total evacuation of Lower Perú by the Spaniards. Carrying his work of reconquest into the district of Charcas or Upper Perú—now Bolivia—Sucre convened a deliberative assembly, which on Aug. 6, 1825, declared Upper Perú independent of Spain and proclaimed it a new State under the name of República Bolívar.

The liberator was named first president, Sucre to be chief executive in his absence. In Dec. 1825, Bolívar transferred his

authority to Sucre, who resigned May 25, but was immediately elected provisional president. In Feb. 1826, the Bolivian congress adopted the famous Constitution which Bolívar had drawn up for them, and in October Sucre was elected constitutional president. It was an awkward position. The native leaders objected to the presence of a foreigner; Sucre fretted at the limitations to his power, and doubted the practicability of Bolívar's Constitution. A mutiny of soldiers at Chuquisaca in April 1828, followed by an invasion from Perú, crystallized his determination to resign. On Aug. 2, 1828, he made his last address to Congress and soon afterward moved to Quito resolved to retire to private life. But in Jan. 1830, he was chosen president of a constituent congress called by Bolívar as a last expedient to preserve the unity of Great Colombia, and was one of the special commissioners appointed to consider ways and means. The plan failed, and on his way back to Quito, he was killed by assassins in the forest of Berueros, near the town of Pasto, Colombia, on June 4, 1830. Sucre stands to-day with Bolívar and San Martín as a great liberator.

See also W. S. Robertson, *The Rise of Spanish-American Nations* (New York, 1921). (W. B. P.)

SUCRE, capital of Bolivia. Pop. (1924, estimate), 16,194, of whom many are Indians and mestizos. The city is in an elevated valley opening southward on the narrow ravine through which flows the Cachimayo, the principal northern tributary of the Pilcomayo. Its elevation, 9,338 ft, gives it an exceptionally agreeable climate. Fertile valleys provide fruit and vegetables, while the vineyards of Cinti supply wine and spirits. The city has broad streets, a central plaza and a *prado*.

The cathedral, dating from 1553, was noted for its wealth; the president's palace and halls of congress are no longer used as such; the cabildo, or townhall; a mint dating from 1572; the courts of justice, and the university of San Xavier, founded in 1624, are historic. Sucre is the seat of the archbishop of La Plata and Charcas, the primate of Bolivia. It is isolated by the difficulty of the roads leading to it. An automobile road, however, now runs to Potosí and the railway lacks only some 50 kilometres of completion (1928).

The Spanish town was founded in 1538 on the site of an Indian village called Chuquisaca, or Chuquichaca (golden bridge), and was called Charcas and Ciudad de la Plata by the Spaniards, though the natives clung to the original Indian name. It was the first city of Spanish South America to revolt against Spanish rule—on May 25, 1809. In 1840 the name Sucre was adopted in honour of the first president of Bolivia (*q v.*).

SUCROSE: *see* SUGAR: *Manufacturing and Refining.*

SUDAN (Arabic *Bilad-es-Sudan,* country of the blacks), that region of Africa which stretches, south of the Sahara and Egypt, from Cape Verde on the Atlantic to Massawa on the Red sea. It is bounded south (1) by the maritime countries of the west coast of Africa, (2) by the basin of the Congo, and (3) by the equatorial lakes, and east by the Abyssinian and Galla highlands. The name is often used in Great Britain, in a restricted sense, to designate only the eastern part of this vast territory, but it is properly applied to the whole area indicated, which corresponds, roughly, to that portion of negro Africa north of the Equator under Mohammedan influence. The Sudan has an ethnological rather than a physical unity, and, politically, it is divided into a large number of States, all now under the control of European Powers.

Within the limits assigned it has a length of about 4,000 m, extending southwards at some points 1,000 m., with a total area of over two million square miles, and a population, approximately, of 40 millions. Between the arid and sandy northern wastes and the well-watered and arable Sudanese lands there is a narrow transitional zone of level grassy steppes, partly covered with mimosas and acacias. Otherwise, the Sudan may be described as a moderately elevated region, with extensive open or rolling plains, level plateaux, and abutting, at its eastern and western ends, on mountainous country. Crystalline rocks, granites, gneisses and schists, of the Central African type, occupy the greater part of the country. Toward the south-east, slates, quartzites and iron-bearing schists occur, but their age is not known.

The Sudan contains the basin of the Senegal and parts of three other hydrographic systems, viz., the Niger, draining southwards to the Atlantic; the central depression of Lake Chad; and the Nile, flowing northwards to the Mediterranean. Lying within the Tropics, and with an average elevation of not more than 1,500 to 2,000 ft. above the sea, the climate of the Sudan is hot, and, in the river valleys, very unhealthy. Cut off from North Africa by the Saharan desert, the inhabitants, who belong, in the main, to the negro family proper, are thought to have received their earliest civilization from the East. Arab influence and the Muslim religion began to be felt in the western Sudan as early as the 9th century, and had taken deep root by the end of the 11th. The existence of native Christian States in Nubia hindered for some centuries the spread of Islam in the eastern Sudan, and throughout the country some tribes have remained pagan It was not until the last quarter of the 19th century that the European nations became the ruling force.

The terms western, central and eastern Sudan are indicative of geographical position merely. The various States are politically divisible into four groups: (1) Those west of the Niger; (2) those between the Niger and Lake Chad; (3) those between Lake Chad and the basin of the Nile; (4) those in the upper Nile valley

The first group fell under the control of France at the end of last century, and are now known as the Upper Senegal and Niger Colony. (*See* SENEGAL, FRENCH WEST AFRICA, etc)

The second group of Sudanese States is almost entirely within the British protectorate of Northern Nigeria. The third, or central group of Sudanese States, is included in French Congo (*q v*) The fourth group consists of the States conquered during the 19th century by the Egyptians, and now under the joint control of Great Britain and Egypt These countries are known collectively as the Anglo-Egyptian Sudan (*see* below)

THE ANGLO-EGYPTIAN SUDAN

Boundaries and Area.—The region which, before the revolt of the Arabized tribes under the Madhi Mohammed Ahmed in 1881–84, was known as the Egyptian Sudan, has, since its reconquest by the Anglo-Egyptian expeditions of 1896–98, been under the joint sovereignty of Great Britain and Egypt It is bounded north by Egypt (the 22nd parallel of N lat. being the dividing line), east by the Red sea, Eritrea and Abyssinia, south by the Uganda Protectorate and Belgian Congo, west by French Congo North of Darfur is the Libyan desert, in which the western and northern frontiers meet. Here the border is defined.[1]

As thus constituted, the Anglo-Egyptian Sudan extends north to south about 1,200 m in a direct line, and west to east about 1,000 m., also in a direct line It covers 950,000 sq m., being about one-fourth the area of Europe In what follows the term Sudan is used to indicate the Anglo-Egyptian condominium only

Physical Features.—The Sudan may be divided, broadly, into two zones The northern portion, from about 16° N, is practically the south-eastern continuation of the Sahara desert; the southern region is fertile, abundantly watered, and, in places, densely forested. West of the Nile there is a distinctly marked intermediate zone of steppes. In the southern district, between 5° and 10° N., huge swamps extend on either side of the Nile and along the Bahr-el-Ghazal.

From south to north the Sudan is traversed by the Nile, at a general level of from 1,600 to 600 ft, and all the great tributaries of that river are either partly or entirely within its borders. The most elevated district is a range of mountains running parallel to the Red sea. They present their steepest face eastward, attaining heights within the Sudan of 4,000 to over 7,000 feet. Jebel Erba, 7,480 ft., and Jebel Soturba, 6,889 ft (both between 21° and 22° N.), the highest peaks, face the Red sea about 20 m. inland. From the Nile, westward, extend vast plains, which, in

[1]It was supposed to be indicated by the line which, according to the Turkish firman of 1841, describes a semi-circle from the Siva Oasis to Wadai, approaching the Nile between the Second and Third Cataracts. This line is disregarded by the Sudan government.

Kordofan and Dar Nuba (between 10° and 15° N.), are broken by hills reaching 2,000 feet. Farther west, in Darfur, the country is more elevated, the Jebel Marra range being from 5,000 to 6,000 ft. high. In the south-west, beyond the valley of the Bahr-el-Ghazal, the country gradually rises to a ridge of low hills which form the water-parting between the Nile and the Congo.

Apart from the Nile system, the Sudan has two other rivers, the Gash and the Baraka, intermittent streams rising in the eastern chain of mountains in Eritrea, and flowing in a general northerly direction. The Gash enters the Sudan near Kassala, and north of that town turns west towards the Atbara, but its waters are dissipated before that river is reached. The Gash, nevertheless, fertilizes a considerable tract of country. The Khor Baraka lies east of the Gash. It flows towards the Red sea in the neighbourhood of Trinkitat (some 50 m. S. of Suakin), but about 30 m. from the coast forms an inland delta. Except in seasons of great rain, its waters do not reach the sea.

The Coast Region.—The coast extends along the Red sea, north to south, from 22° N. to 18° N., a distance following the indentations of the shore of over 400 miles. The most prominent headland is Ras Rawaya (21° N.), which forms the northern shore of Dokhana bay. There are few good harbours, Port Sudan and Suakin being the chief ports. South of Suakin is the shallow bay of Trinkitat. A large number of small islands lie off the coast. A belt of sandy land covered with low scrub stretches inland 10 to 20 miles. Beyond this plain rise the mountain ranges already mentioned. Their seaward slopes often bear a considerable amount of vegetation.

The Desert Zone.—Between the coast and the Nile lies the Nubian desert, a rugged, rocky, barren waste, scored with khors or wadis, along whose beds there is scanty vegetation. Along either bank of the Nile is a narrow strip of cultivable land. West of the Nile, except for a few oases, the country is even more desolate than the Nubian desert.

The Intermediate Zone and the Fertile Districts.—The country enclosed by the Nile, the Atbara and the Blue Nile, the so-called Island of Meroë, consists of very fertile soil. The fork between the White and Blue Niles, the Gezira, is also fertile land. South of the Gezira is Sennar, a well-watered country of arable and grazing lands. West of the Nile, Kordofan, which comes between the desert and the plains of the Bahr-el-Ghazal, is largely barren and steppe land. South of 10° N. there is everywhere abundance of water. Darfur is mainly open, steppe-like country, with extensive tracts of cultivable land and a central mountain massif, the Jebel Marra.

Climate.—The country lies wholly within the Tropics, and as the greater part of it is far removed from the ocean and less than 1,500 ft. above the sea, it is extremely hot. The heat is greatest in the central regions, least in the desert zone, where the difference between summer and winter is marked. Nevertheless, the dryness of the air renders the climate healthy. The steppe countries, Kordofan and Darfur, are also healthy, except after the autumn rains. At Khartoum (Khartum), centrally situated, the minimum temperature is about 40° F, the maximum 113°, the mean annual temperature 80°. January is the coldest and June the hottest month. Violent sandstorms are frequent from June to August. Four rain zones may be distinguished. The northern (desert) region is one of little or no rain. There are, perhaps, a few rainy days in winter and an occasional storm in the summer. In the central belt, where "the rainy season" is from mid-June to September, there are some 10 in. of rain during the year. The number of days on which rain falls rarely exceeds, however, 15. The rainfall increases to about 20 in. per annum in the eastern and south-eastern regions. In the swamp district and throughout the Bahr-el-Ghazal, heavy rains (40 in. or more a year) are experienced. The season of heaviest rain is from April to September. In the sudd region the temperature averages about 85° F, the air is always damp, and fever is endemic.

Flora.—In the deserts north of Khartoum, vegetation is almost confined to stunted mimosa and, in the less arid districts, scanty herbage. Between the desert and the cultivated Nile lands is an open growth of samr, hashab (*Acacia verek*) and other acacia trees. Between Khartoum and 12° N. forest belts line the banks of the rivers and khors, in which the most noteworthy tree is the sunt (*Acacia arabica*). Farther from the rivers are open woods of heglig (*Balanites aegyptiaca*), hashab, etc., and dense thickets of laot (*Acacia nubica*) and kittr (*Acacia mellifera*). These open woods cover a considerable part of Kordofan, the hashab and talh trees being the chief producers of gum arabic. On the Blue Nile the forest trees alter, the most abundant being the babanus (Sudan ebony), and the silag (*Amogeissus leiocarpus*), while gigantic baobabs, called tebeldi in the Sudan, and tarfa (*Sterculia cinerea*) are numerous. In southern Kordofan and in the higher parts of the Bahr-el-Ghazal the silag and ebony are also common, as well as African mahogany (homraya, *Khaya senegalensis*) and other timber trees. In the Ghazal province also are many rubber-producing lianas, among them the *Landolphia owariensis*. There are also forest regions in the Bahr-el-Jebel, in the Mongalla Mudiria and along the Abyssinian-Eritrean frontier. East of the Bahr-el-Jebel and north of the Bahr-el-Ghazal are vast prairies covered with tall coarse grass. Cotton is indigenous in the valley of the Blue Nile, and in some districts bamboos are plentiful. The castor-oil plant grows in almost every province.

Fauna.—Wild animals and birds are numerous. Elephants are abundant in the Bahr-el-Ghazal and Bahr-el-Jebel forests, and are found in fewer numbers in the upper valley of the Blue Nile. The hippopotamus and crocodile abound in the swamp regions, which also shelter many kinds of water-fowl. The lion, leopard, giraffe and various kinds of antelope are found in the prairies and in the open woods. In the forests are numerous bright-plumaged birds and many species of monkeys, mostly ground monkeys—the trees being too prickly for climbing. Snakes are also plentiful, many poisonous kinds being found. In the steppe regions of Kordofan, Darfur, etc., and in the Nubian desert, ostriches are fairly plentiful. Insect life is very abundant, especially south of 12° N., the northern limit of the tsetse fly. The chief pests are mosquitoes, termites and the serut, a brown fly about the size of a wasp, with a sharp stab, which chiefly attacks cattle.

Inhabitants.—The population, always sparse in the desert and steppe regions, was never dense, even in the more fertile southern districts. Excluding Darfur, the population before the Mahdist rule was estimated at 8,500,000. After the desolation of the Mahdia, an estimate made in 1905 put the population at 1,853,000. This included 11,000 foreigners, of whom 2,800 were Europeans. Since that year there has been a rapid increase, and in 1926 the population was officially estimated at close on six million.

The northern portion of the Sudan is occupied by Hamitic and Semitic tribes, chiefly nomads, and classed as Arabs. In the Nile valley north of Khartoum the inhabitants, especially the so-called Nubians, are of very mixed origin. Elsewhere, the inhabitants north of 12° N. are of mixed Arab descent. In the Nubian desert the chief tribes are the Ababda and Bisharin. In the region south of Berber and Suakin are the Hadendoa. The Jaalin, Hassania and Shukria inhabit the country between the Atbara and Blue Nile; the Hassania and Hassanat are found chiefly in the Gezira. The Kabbabish occupy the desert country north of Kordofan, which is the home of the Baggara tribes. In Darfur the inhabitants are of mixed Arab and negro blood.

Of negro Nilotic tribes there are three or four main divisions. The Shilluks occupy the country along the west side of the Nile northward from about Lake No. The Dinkas are widely spread over the Bahr-el-Ghazal province. South of Kordofan and west of the Shilluk territory are the Nubas, apparently the original stock of the Nubians. In the south-west of the Bahr-el-Ghazal are the Bongos and other tribes, and along the Nile-Congo water-parting are the A-Zande or Niam-Niam, a comparatively light-coloured race.

Social Conditions.—In contrast with the Egyptians, a most industrious race, the Sudanese tribes, both Arab and negro, are, as a general rule, indolent. Where wants are few and simple, where houses need not be built nor clothes worn to keep out the cold,

there is little stimulus to exertion. Many Arabs "clothed in rags, with only a mat for a house, prefer to lead the life of the free-born sons of the desert, no matter how large their herds or how numerous their followings." Following the establishment of British control, slave-raiding and the slave trade were stopped, but domestic slavery continues A genuine desire for education is manifest among the Arabic-speaking peoples, and slow but distinct moral improvement is visible among them. The Dongolese people are the keenest traders in the country. The Arab tribes are all Mohammedans, credulous and singularly liable to fits of religious excitement. Most of the negro tribes are pagan, but some of them who live in the north have embraced Islam

Divisions and Chief Towns.—The Sudan is divided into mudirias (provinces) and these are subdivided into mamuria The mudirias are Halfa, Red sea, Dongola and Berber in the north (these include practically all the region known as Nubia); Khartoum, Blue Nile and White Nile in the centre; Kassala and Fung in the east; Darfur (until recently under native rule), Kordofan and Nuba mountains in the west; and Bahr-el-Ghazal, Upper Nile (formerly Fashoda) and Mongalla in the south. The mudirias vary considerably in size.

The capital, Khartoum, is built in the fork formed by the junction of the White and Blue Niles Opposite Khartoum, on the west bank of the White Nile, is Omdurman, the capital of the Sudan during the Mahdia. On the Nile, north of Khartoum, are the towns of Berber, Abu Hamed, Merawi (Merowe), Dongola and Wadi Halfa. On the Red sea are Port Sudan and Suakin. Kassala is on the river Gash, east of the Atbara and near the Eritrean frontier. On the Blue Nile are Kamlin, Sennar, Wad Medani, a thriving business centre and capital of the Blue Nile mudiria, and Roseires, which marks the limit of navigability by steamers of the river Gallabat is a town in the Kassala mudiria, close to the Abyssinian frontier, and Gedaref lies between the Blue Nile and Atbara. El Obeid, the chief town of Kordofan, is 230 m. S W by S of Khartoum Duiem, capital of the White Nile mudiria, is the river port for Kordofan El Fasher, the capital of Darfur, is 500 m. W.S W. of Khartoum All the towns named, except Roseires, are situated north of 13° N In the south of the Sudan there are no towns properly so called Fashoda, renamed Kodok, is the headquarters of the Upper Nile mudiria.

Communications.—North of Khartoum the chief means of communication is by railway; south of that city by steamer There are two trunk railways, one connecting the Sudan with Egypt, the other affording access to the Red sea. The first line runs from the Nile at Wadi Halfa across the desert in a direct line to Abu Hamed, and thence along the right (east) bank of the Nile to Khartoum. At Khartoum the Blue Nile is bridged, and the railway is continued south through the Gezira to Sennar, where it branches west to cross the White Nile at Kosti and run on to El Obeid. The length of the line from Halfa to Khartoum is 575 m ; from Khartoum to Obeid 350 miles The railway from the Nile to the Red sea starts from the Halfa-Khartoum line at Atbara junction, and runs to Port Sudan and Suakin; a branch leaving at Haiya for Kassala and (shortly) Gedaref The total distance to Port Sudan from Khartoum is 493 miles. Besides these main lines a railway, 138 m. long, runs from Abu Hamed, on the right bank of the Nile, to Kareima (opposite Merawi), in the Dongola mudiria below the Fourth Cataract. The railways are owned and worked by the State

In connection with the Khartoum-Halfa railway, steamers ply on the Nile between Halfa and Shellal, where the railway from Alexandria ends. The distance by rail and steamer between Khartoum and Alexandria is about 1,490 miles Steamers run on the Nile between Kerma and Kareima, and above Khartoum the Government maintains a regular service of steamers as far south as Gondokoro, in the Uganda Protectorate, and Rejaf, for the Belgian Congo During the flood season there is also a steamship service on the Blue Nile as far as Roseires. Powerful dredgers and sudd-cutting machines are used to keep open communications in the Upper Nile and Bahr-el-Ghazal. The ancient caravan routes, Korosko–Abu Hamed and Berber–Suakin, have been superseded by the railways, but elsewhere wells and rest-houses are maintained along the principal routes between the towns and the Nile. On some of these roads a motor car service is in operation.

There is an extensive telegraphic system. Khartoum is connected by land lines with Egypt and Uganda, thus affording direct telegraphic connection between Alexandria and Mombassa (2,500 miles). From Khartoum other lines go to Kassala and the Red sea ports In some places the telegraph wires are placed 16 ft. 6 in. above the ground, to protect them from damage by giraffes

Agriculture and Other Industries.—North of Khartoum agricultural land is confined to a narrow strip on either side of the Nile and to the few oases in the Libyan desert. In the Gezira, and in the plains of Gedaref between the Blue Nile and the Atbara, there are wide areas of arable lands, as also in the neighbourhood of Kassala, along the banks of the Gash; and these have recently been converted, by great irrigation works, into fertile cotton lands, with remarkable effects on the prosperity of the country. In Kordofan and Darfur cultivation is confined to the khors or valleys. The chief grain crop is durra, the staple food of the Sudanese. Two crops are obtained yearly in several districts. On lands near the rivers the durra is sown after the flood has gone down, and also at the beginning of the rainy season. Considerable quantities of wheat and barley are also grown. Other food-stuffs raised are lentils, beans, onions and melons. The date-palm is cultivated along the Nile valley below Khartoum, especially on the west bank in the Dongola mudiria and in the neighbouring oases. Dates are also a staple product in Darfur and Kordofan. Ground-nuts and sesame are grown in large quantities for the oil they yield. The Sudan was the original home of Egyptian cotton, and the cotton now grown is equal to the produce of the Delta

For watering the land by the river banks sakias (water-wheels) are used, oxen being employed to turn them. In 1910 a system of basin irrigation was begun in Dongola mudiria In 1925 was completed a canal scheme for irrigating the Gezira, drawing its waters from the new Makwar reservoir on the Blue Nile, near Sennar. It commands an area of 300,000 acres. The Gash irrigation in the Kassala district is steadily expanding

Gum and rubber are the chief forest products. The gum is obtained from eastern Kordofan and in the forests in the upper valley of the Blue Nile. The wood of the sunt tree is used largely for boat-building, and for fuel, and the mahogany tree yields excellent timber. Elephants are hunted for the sake of their ivory. The Dongola breed of horses is noted for its strength and hardiness The camels are bred in the desert north of Berber, between the Nile and the Red sea, in southern Dongola, in the Hadendoa country and in northern Kordofan. The camel, horse and ostrich are not found south of Kordofan and Sennar. The negro tribes living south of those countries possess large herds of cattle, sheep and goats. Fowls are plentiful, but of poor quality Donkeys are much used in the central regions; they make excellent transport animals.

Mineral Wealth.—In ancient times Nubia, *i.e.,* the region between the Red sea and the Nile south of Egypt and north of the Suakin-Berber line, was worked for gold. In 1905 gold-mining recommenced in Nubia, in the district of Um Nabardi, which is in the desert, about midway between Wadi Halfa and Abu Hamed; and the producing stage was reached in 1908. Small quantities of gold-dust are also obtained from Kordofan. Gold is found in the Beni-Shangul country south-west of Sennar. There is lignite in the Dongola mudiria and iron ore is found in Darfur, southern Kordofan and in the Bahr-el-Ghazal The district of the Hofrat-el-Nahas (the copper mine) is rich in copper, the mines having been worked intermittently from remote times.

Trade.—As an export, cotton is ahead of all the others taken together. It is followed by gum, cotton-seed, sesame, and hides and skins. Live stock, dates, ivory and gold are also exported. The Red sea ports trade largely with Arabia and engage in pearl fishery. The principal imports are cotton goods, food-stuffs (flour, sugar, tea and coffee), timber, tobacco, coal, railway materials, iron and machinery. The value of the trade, which during the

Mahdist rule (1884–98) was a few thousands only, had increased in 1905 to over £1,500,000. In 1927 the exports of Sudan produce were valued at £5,000,000, of which more than half was cotton; the total imports at £6,155,000. Great Britain takes the major part of the exports, and provides over one-third of the imports.

Economic Development.—Since the pacification of the Sudan, the two chief advances in its prosperity have been the provision of an efficient sea-base for its trade, and the extension of its cotton cultivation. Until 1906, when the railway to the Red sea was opened, trade was gravely hampered by the heavy cost of transit through Egypt. At Port Sudan, in 1927, the trade handled was over £9,500,000 in value, by shipping with a tonnage in the vicinity of four million tons; and railway developments are keeping pace with the popularity of the port. The production of long staple cotton of the best Egyptian type has been stimulated by the settlement and irrigation of the Gezira. Its canal scheme cost about 12 millions, obtained on loan guaranteed by the British Government, and the land is worked on the basis of a partnership between the Government, the Sudan Plantations syndicate and the Sudanese cultivators. The syndicate breaks up new land, provides villages and cultivating plant, and collects the produce. The cultivator gets the whole of the rotation food crops, 40% of the value of the cotton, and free land and water.

The Kassala cotton area on the inland delta of the Gash was developed by a railway financed under the guarantee of the British Government, and it is worked by the Kassala Cotton company, under an arrangement similar to that which operated in the Gezira. In the Tokar area cotton is grown between the Red sea mountains and the coast, and with the help of a small railway to the harbour of Trinkitat. The total export of ginned cotton in 1927 was 642,024 cantars, and of cotton seed 57,847 tons; their gross value being taken at £3,693,000.

ADMINISTRATION

Government.—Pending the settlement between Great Britain and the new Egyptian Government of the status of the Sudan, the convention of Jan. 10, 1899, still holds good, by which the governor-general of the Sudan is appointed by the king of Egypt, on the recommendation of the British Government. He is assisted by a council of six to eight members (largely official), who advise him in executive and legislative matters, subject to his power of veto. The country is divided into provinces (*mudirias*) each under a governor (mudir) who is responsible to the governor-general. The administrative service, formerly staffed mainly by British officers, is now recruited by restricted competition from England. The minor officials are mostly Egyptian or Sudanese, with a small admixture of Syrians; the Egyptians have been much reduced in number since the troubles of 1924. Revenue is derived from the customs and earning departments (railways, steamers, posts and telegraphs), supplemented by substantial receipts from taxes on land, date-trees, trade-licences, royalties on gum, ostrich feathers, ivory, rubber, senna and other forest produce, excise and arms licences and shooting fees. The tariff comprises a 10% *ad valorem* duty on most articles, with from 16s. to £1 per kilo. on tobacco, and an all-round export duty of 1% *ad valorem*. The Government has always been largely dependent on the Egyptian Treasury, both for loans and for the liquidation of its annual deficits; but recently it has looked for its loans to the British market, while it endeavoured to develop its own financial resources to meet the expenditure on its defence, education, public works and administration. The State revenue was £126,596 in 1899; by 1926 it had risen to £5,858,000, with an expenditure of £5,482,000.

Justice.—The Sudan judicial codes, based, in part, on those of India, and, in part, on the principles of English law and of Egyptian commercial law, provide for the recognition of "customary law" so far as applicable and "not repugnant to good conscience." In each mudiria criminal justice is administered by a court, consisting of the mudir (or a judge) and two magistrates, which has general competence. The magistrates are members of the administrative staff, who try minor cases without the help of the mudir (or judge). The governor-general possesses revising powers in all cases. Civil cases of importance are heard by a judge (or where no judge is available by the mudir or his representative); minor civil cases are tried by magistrates. From the decision of the judges an appeal lies to the High Court at Khartoum, composed of a chief justice and four puisne judges. Jurisdiction in all legal matters as regards personal status of Mohammedans is administered by a grand cadi and a staff of subordinate cadis. The police force of each mudiria is independently organized under the control of the mudirs.

Education.—Education is in charge of the department of public instruction. Elementary education, the medium of instruction being Arabic, is given in *kuttabs* or village schools. There are primary schools in the chief towns where English, Arabic, mathematics, and, in some cases, land-measuring are taught. There are also Government industrial workshops, and a few schools for girls. The Gordon college at Khartoum undertakes a suitable variety of vocational teaching, along with the training of teachers and judges in the Mohammedan courts, and has annexed to it a secondary school. The college also contains the Wellcome laboratories for scientific research. Among the pagan negro tribes Protestant and Roman Catholic missions are established. These missions carry on educational work, special attention being given to industrial training.

Defence.—The defence of the country used to be entrusted to the Egyptian army; but in 1924 the Egyptian units were removed, and the defence force is now composed of local material under British officers. A small force of British troops is also stationed in the Sudan—chiefly at Khartoum. They are under the command of the governor-general in virtue of an arrangement made in 1905, having previously been part of the Egyptian command.

ARCHAEOLOGY

Archaeological study in the Sudan, retarded for many years by political conditions, gave rich returns. The work, which had been begun by Cailliaud, Champollion, Lepsius and others, was interrupted by the rise of the Mahdist power; and with the frontiers of Egypt itself menaced by dervishes, the country south of Aswan was necessarily closed to the student of antiquity. Even after the dervishes had been overthrown at the battle of Omdurman (1898) it was some time before archaeologists awoke to the sense of the historical importance of the regions thus made accessible to them. What aroused them was the danger of submergence with which many ancient sites were threatened by the raising of the Aswan dam. A large sum of money was assigned by the Government, partly for the preservation of the visible temples in the area to be submerged, partly for an official expedition under the charge of Dr. G. A. Reisner, which was to search for all remains of antiquity hidden beneath the ground. At the same time the University of Pennsylvania dispatched the Eckley B. Coxe, jun., expedition, which devoted its attention to the southern half of Lower Nubia, from Halfa to Korosko, while the Government excavators explored from Korosko to Aswan. Thus material was acquired which throws a flood of light on the archaeology at once of Egypt and the Sudan. For though all except the southern twenty miles of Lower Nubia has been attached for purposes of administration of Egypt proper, yet this political boundary is purely artificial. The natural geographical and ethnical southern frontier of Egypt is the First Cataract; Egyptian scribes of the Old Empire recognized this truth no less clearly than Diocletian, and Juvenal anticipates the verdict of every modern observer when he describes the "porta Syenes" as the gate of Africa. The reconnaissances of Dr. Wallis Budge, Prof. A. H. Sayce, Mr. Somers Clarke, Prof. J. Garstang and more recent investigators, cover the well known monuments left by Egyptian kings whose history is tolerably familiar from other sources. The inscriptions of these kings and their officials have been collected by Prof. J. H. Breasted. But, while the central and southern Sudan is almost a virgin field for the archaeologist, the exploration of Lower Nubia has made important progress.

The Sudan is primarily and above all the country of the *black* races, of those Nilotic negroes whose birthplace may be supposed to have been near the Great Lakes. But upon this aboriginal stock were grafted, in very early times, fresh shoots of more vigorous

and intellectual races coming, probably, from the East. Lower Nubia was one of the crucibles in which several times was formed a mixed nation which defied or actually dominated Egypt. There is some scientific ground for dating the earliest example of such a fusion to the exact period of the Egyptian Old Empire. The Ethiopians who usurped the crown of the Pharaohs from 740–660 B.C. were of a mixed stock akin to the modern Barabra; the northern Nubians who successfully defied the Roman emperors were under the lordship of the Blemyes (Blemmyes), an East African tribe, and the empire of the Candace dynasty, no less than the Christian kingdoms which succeeded it, included many heterogeneous racial elements. The real history of the Sudan will, therefore, be concerned with the evolution of what may be called East African or East Central African civilizations

From the purely Egyptological standpoint there is much of value to be learned from the Sudan. The Egyptian penetration of the country began, according to the evidence of inscriptions, as early as the Old Empire Under the 12th dynasty colonies were planted and fortresses established down to the Bahr-el-Hagar. During the 18th dynasty the political subjugation was completed, and the newly-won territories were studded with cities and temples as far south as the Fourth Cataract. Some 200 years later the priests of Amen, flying from Thebes, founded a quasi-Egyptian capital at Napata. But after this date Egypt played no part in the evolution of the country. Its history, therefore, as an independent civilization may be said to date from the 8th century B C, though future researches may be able to carry its infant origins to a remoter past.

Of the 1,000 years or more of effective Egyptian occupation many monuments exist, but on a broad, general view it must be pronounced that they owe their fame more to the accident of survival than to any special intrinsic value For, excepting Philae, which belongs as much to Egypt as to Ethiopia, Abu Simbel is the only temple which can be ranked among first-rate products of Egyptian genius; although Dr. Reisner's discoveries leave little doubt that the archaic culture first detected at Nagada and Abydos, and then at many points as far north as Giza, extended southwards into Nubia at least as far as Gerf Husein. This was wholly unexpected, and if, as seems probable, the evidence stands the test of criticism, it is a new historical fact of great importance. The government expedition found traces between Aswan and Korosko of all the principal periods from this early date down to the Christian era The specimens obtained are kept in a separate room of the Cairo Museum, where they form a collection of great value.

The work of the Pennsylvanian expedition opened a new chapter in the history of the African races. No records, indeed, were discovered of the founders of the first great Ethiopian kingdom from Piankhi to Tirhakah, nor has any fresh light been thrown upon the relations which that remarkable king, Ergamenes, maintained with the Egyptian Ptolemies. But the exploration of sites in the southern half of Lower Nubia has revealed the existence of a wholly unsuspected independent civilization which grew up during the first six centuries after Christ. The history of the succeeding periods, moreover, has been partially recovered and the study of architecture enriched by the excavation of numerous churches dating from the time of Justinian, when Nubia was first Christianized, down to the late mediaeval period when Christianity was extirpated by Mohammedanism

The civilization of the first six centuries A D. may be called "Romano-Nubian," a term which indicates its date and suggests something of its character. It is the product of a people living on the borders of the Roman empire who inherited much of the Hellenistic tradition in minor arts, but combined it with a remarkable power of independent origination The sites on which it has been observed range from Dakka to Halfa, that is to say, within the precise limits which late Latin and Greek writers assign to the Blemyes, and there is a good reason to identify the people that evolved it with this hitherto almost unknown barbarian nation. Apart from this, however, the greatest value of the new discoveries consists in the fact that they are laying the foundations for a new documentary record of past ages. For the graves yielded not only new types of statues, bronzes, ivory carvings and painted pottery —all of the highest artistic value—but also a large number of stone stelae inscribed with funerary formulae in the Meroitic script.

In the course of sixty years the small collection of Meroitic inscriptions made by Lepsius had not been enlarged and no progress had been made towards decipherment. But the cemeteries of Shablul and Karanog alone yielded 170 inscriptions on stone, besides some inscribed ostraka. This mass of material brought the task of decipherment within the range of possibility, and even without any bilingual record to assist him, Mr. F. Ll. Griffith rapidly succeeded in the first stages of translation. As further explorations bring more inscriptions to light the records of Ethiopia will gradually be placed on a firm documentary basis and the names and achievements of its greatest monarchs will take their place on the roll of history.

Ancient Monuments South of Halfa.—Ruins of pyramids, temples, churches and other monuments are found along both banks of the Nile, almost as far south as the Fourth Cataract, and again in the "Island of Meroë." In the following list the ruins are named as met with on the journey south from Wadi Halfa Opposite that town, on the east bank, are the remains of Bohon, a town founded under the 12th dynasty, and with a fine temple of 18th dynasty work. Forty-three miles farther south are the ruins of the twin fortresses of Kumma and Semna At Amara, some 80 m. above Semna, are the ruins of a temple with Meroitic hieroglyphics. At Soleb, 143 m. above Halfa, are the ruins of a fine temple commemorating Amenophis (Amenhotep) III. (*c.* 1414 B.C.), to whose queen, Taia, was dedicated a temple at Sedeinga, a few miles to the north At Sesebi, 40 m. higher up the Nile, is a temple of the heretic king, Ikhnaton, re-worked by Seti I. (*c* 1327 B C). Opposite Hannek, at the Third Cataract on Tombos island, are extensive ancient granite quarries, in one of which lies an unfinished colossus. On the east side of the river, near Kerma, are the remains of an Egyptian city. Argo island, a short distance higher up, abounds in ruins, and from Old Dongola to Merawi (a distance of 100 m. by the river) are numerous ruins of monasteries, churches and fortresses of the Christian era in Nubia—notably at Jebel Deka and Magal. In the immediate neighbourhood of Jebel Barkal (the "holy mountain" of the ancient Egyptians), a mile or two above the existing village of Merawi (Merowe), are many pyramids and six temples, the pyramids having a height of from 35 to 60 feet They mark the site of Napata, the religious capital of ancient Ethiopia, from which spread the worship of Amen. On the left bank of the Nile, opposite Merawi, are the pyramids of Nuri, and a few miles distant, in the Wadi Ghazal, are the ruins of a great Christian monastery, where were found gravestones with inscriptions in Greek and Coptic. Thirty miles north of the town of Shendi are the pyramids of Meroë, in three distinct groups From one of these pyramids was taken "the treasure of Queen Candace," now in the Berlin museum. Excavation is busy with this ancient site, and, among a vast number of tombs, shrines and dwellings there stand out the Temple of the Sun (600 B C) and the pylon of a great temple to Amen (300 B.C.), the most perfect ruins in the Sudan, associated with the Ethiopian kingdom of Queen Candace They comprise three temple groups, in good preservation, at Nagaa, and a mass of buildings at Mussawarat, belonging to the 2nd or 3rd century A.D. Farther south, Christian remains are to be seen on the east bank of the Blue Nile, about 13 m above Khartoum, at Soba, at Ceteina, on the White Nile, and at Wad-el-Hadad, some miles north of Sennar, on the Blue Nile.

Between the Nile at Wadi Halfa and the Red sea are the remains of towns inhabited by the ancient miners who worked the district. The most striking of these towns is Deraheib (Castle Beautiful), so named from the picturesque situation of the castle, a large square building with pointed arches. The walls of some 500 houses still stand.

HISTORY

From the Earliest Time to the Egyptian Conquest.—The southern regions of the Anglo-Egyptian Sudan are without recorded history until the era of the Egyptian conquest in the 19th century. In the northern regions, known as Ethiopia or Nubia, Egyptian influence made itself felt as early as the Old Empire. In process of time powerful States grew up with capitals at Napata and Meroë (see *ante* sec. *Archaeology* and ETHIOPIA and EGYPT). The Nubians—that is the dwellers in the Nile valley between Egypt and Abyssinia—did not embrace Christianity until the 6th century, considerably later than their Abyssinian neighbours. The Arab invasion of north Africa in the 7th century, which turned Egypt into a Mohammedan country, had not the same effect in Nubia, the Muslims, though they frequently raided the country, being unable to hold it. On the ruins of the ancient Ethiopian States arose the Christian kingdoms of Dongola and Aloa, with capitals at Dongola and Soba (corresponding roughly to Napata and Meroë). These kingdoms continued to exist until the middle of the 14th century or later (*see* DONGOLA). Meanwhile Arabs of the Beni Omayya tribe, under pressure from the Beni Abbas, had begun to cross the Red sea as early as the 8th century and to settle in the district around Sennar on the Blue Nile, a region which probably marked the southern limits of the kingdom of Aloa. The Omayya, who during the following centuries were reinforced by further immigrants from Arabia, intermarried with the negroid races, and gradually Arab influence became predominant and Islam the nominal faith of all the inhabitants of Sennar. In this way a barrier was erected between the Christians of Nubia and those of Abyssinia. By the 15th century the Arabized negro races of the Blue Nile had grown into a powerful nation known as the Funj, and during that century they extended their conquests north to the borders of Egypt. The kingdom of Dongola had already been reduced to a condition of anarchy by Muslim invasions from the north. Christianity was still professed by some of the Nubians as late as the 16th century, but the whole Sudan north of the lands of the pagan negroes (roughly 12° N.) was then under Muslim sway. At that time the sultans of Darfur (*q.v.*) in the west, and the sultans or kings of Sennar (the Funj rulers) in the east, were the most powerful of the Mohammedan potentates.

The first of the Funj monarchs acknowledged king of the whole of the allied tribes, of which the Hameg were next in importance to the Funj, was Amara Dunkas, who reigned *c.* 1484–1526. During the reign of Adlan, *c.* 1596–1603, the fame of Sennar attracted learned men to his court from such distant places as Cairo and Baghdad. Adlan's great-grandson Badi Abu Daku attacked the Shilluk negroes and raided Kordofan. This monarch built the great mosque at Sennar, almost the only building in the town to survive the ravages of the dervishes in the 19th century. In the early part of the 18th century there was war between the Sennari and the Abyssinians, in which the last named were defeated with great slaughter, a victory over the "infidels" which became celebrated throughout the Mohammedan world. Towards the end of the 18th century the Hameg wrested power from the Funj and the kingdom fell into decay, many of the tributary princes refusing to acknowledge the king of Sennar. The disorders resulting from this decline continued up to the time of the conquest of the country by the Egyptians.

From the Egyptian Conquest to the Rise of the Mahdi.—The conquest of Nubia was undertaken in 1820 by order of Mehemet Ali, the pasha of Egypt, and was accomplished in the two years following. His leading motive was, probably, the desire to obtain possession of the mines of gold and precious stones which he believed the Sudan contained. Mehemet Ali also wished to crush the remnant of the Mamelukes, who in 1812 had established themselves at Dongola, and to keep busy the Albanians and Turks in his army, whose fidelity was doubtful.

Mehemet Ali gave the command of the army sent to Nubia to his son Ismail, who at the head of some 4,000 men left Wadi Halfa in October 1820. Following the Nile route he occupied Dongola without opposition, the Mamelukes fleeing before him. (Some of them went to Darfur and Wadai, others made their way to the Red Sea. This was the final dispersal of the Mamelukes.) With the nomad Shagia, who dominated the district Ismail had two sharp encounters, one near Korti, the other higher up the river, and in both fights Ismail was successful. Thereafter the Shagia furnished useful auxiliary cavalry to the Egyptians. Ismail remained in the Dongola province till February 1821, when he crossed the Bayuda Desert and received the submission of the meks (kings) of Berber, Shendi and Halfaya, nominal vassals of the king of Sennar. Continuing his march south Ismail reached the confluence of the White and Blue Niles and established a camp at Ras Khartum. (This camp developed into the city of Khartum.) At this time Badi, the king of Sennar, from whom all real power had been wrested by his leading councillors, determined to submit to the Egyptians, and as Ismail advanced up the Blue Nile he was met at Wâd Medani by Badi who declared that he recognized Mehemet Ali as master of his kingdom. Ismail and Badi entered the town of Sennar together on June 12, 1821, and in this peaceable manner the Egyptians became rulers of the ancient empire of the Funj. In search of the gold-mines reported to exist farther south Ismail penetrated into the mountainous region of Fazokl, where the negroes offered a stout resistance. In Feb. 1822 Ismail set out on his return to Dongola, having received reports of risings against Egyptian authority. The Egyptian soldiery had behaved with barbarity. Ismail, Nair Mimr, the *mek* of Shendi, had been a sort of hostage, and entertained hatred of the pasha. On Ismail's return to Shendi, Oct. 1822, he demanded of the *mek* 1,000 slaves to be supplied in two days. The *mek*, promising compliance, invited Ismail and his chief officers to a feast in his house, around which he had piled heaps of straw. Whilst the Egyptians were feasting the *mek* set fire to the straw and Ismail and all his companions were burnt to death.

Ismail's death was speedily avenged. A second Egyptian army, also about 4,000 strong, had followed that of Ismail's up the Nile, and striking south-west from Debba, had wrested, after a sharp campaign, the province of Kordofan (1821) from the sultan of Darfur. This army was commanded by Mohammed Bey, the Defterdar, son-in-law of Mohammed Ali. Hearing of Ismail's murder the Defterdar marched to Shendi, defeated the forces of the *mek*, and took terrible revenge upon the inhabitants of Metemma and Shendi, most of the inhabitants, including women and children, being burnt alive. Nair Mimr escaped to the Abyssinian frontier, where he maintained his independence.

Character of Egyptian Rule.—Having conquered Nubia, Sennar and Kordofan the Egyptians set up a civil Government, placing at the head of the administration a governor-general with practically unlimited power. Khurshid pasha (governor-general 1826–39) gained a great reputation both for rectitude and vigour, but, with rare exceptions, his successors did not conceive that the welfare of the people was any part of the task of government. About this period Mohammed Ali leased from the sultan of Turkey the Red sea ports of Suakin and Massawa, and thus got into his hands the trade routes of the eastern Sudan. The pasha of Egypt practically monopolized the trade of the country except that in slaves, for which border lands were raided annually. From the negro population the army was so largely recruited that in a few years the only non-Sudanese in it were officers. The Egyptian rule proved harmful to the country. The governors-general and the leading officials were nearly all Turks, Albanians or Circassians, and, with rare exceptions, the welfare of the various peoples of the Sudan formed no part of their conception of government.

Numerous efforts were made to extend the authority of Egypt. In 1840 the fertile district of Taka, watered by the Atbara and Gash and near the Abyssinian frontier, was conquered and the

town of Kassala founded. In 1837 the pasha himself had visited the Sudan, going as far as Fazokl, where he inspected the goldfields.

The successors of Mohammed Ali, in an endeavour to make the country more profitable, extended their conquests to the south, and in 1853 and subsequent years trading posts were established on the Upper Nile The Government monopoly in trade had ceased in 1849 on the death of Mohammed Ali. The pioneer European merchant was John Petherick, British consular agent at Khartoum Petherick sought for ivory only, but those who followed him soon found that slave-raiding was more profitable than elephant hunting. The viceroy Said, who made a rapid tour through the Sudan in 1857, found it in a deplorable condition. The viceroy ordered many reforms to be executed and proclaimed the abolition of slavery The reforms were mainly inoperative and slavery continued. The European merchants above Khartoum had sold their posts to Arab agents, who oppressed the natives in every conceivable fashion. Ismail Pasha, who became viceroy of Egypt in 1863, again gave orders for the suppression of the slave trade, and to check the operations of the Arab traders a military force was stationed at Fashoda (1865), this being the most southerly point then held by the Egyptians Ismail, however, was ambitious to extend his dominions and to develop the Sudan on the lines he had conceived for the development of Egypt. He obtained (1865) from the sultan of Turkey a firman assigning to him the administration of Suakin and Massawa, the lease which Mohammed Ali had of these ports having lapsed after the death of that pasha. Ismail subsequently (1870–75) extended his sway over the whole coast from Suez to Cape Guardafui but on the rise of the Mahdi (see *infra*) Egyptian authority was withdrawn (1884) from the coast regions south of Suakin.

Baker and Gordon.—At the same time that Ismail annexed the seaboard he was extending his sway along the Nile valley to the equatorial lakes, and conceived the idea of annexing all the country between the Nile and the Indian ocean. An expedition was sent (1875) to the Juba river with that object, but it was withdrawn at the request of the British Government, as it infringed the rights of the sultan of Zanzibar. Meanwhile, on the main Nile, control of all territories south of Gondokoro had been given to Sir Samuel Baker, who, reaching Gondokoro on May 26, 1870, formally annexed that station, which he named Ismailia, to the khedival domains. Baker remained as governor of the Equatorial Provinces until Aug. 1873, and in March 1874 Col. C. G Gordon took up the same post. Both Baker and Gordon made strenuous efforts towards crushing the slave trade, but their endeavours were largely thwarted by the inaction of the authorities at Khartoum Under Gordon the Upper Nile region as far as the borders of Uganda came more or less effectively under Egyptian control On the west the Bahr-el-Ghazal had been overrun by Arab or semi-Arab slave-dealers who reduced that region to a state of abject misery. The most powerful of the slave traders was Zobeir Pasha, who, having defeated a force sent from Khartoum to reduce him to obedience, invaded Darfur (1874) The khedive, fearing the power of Zobeir, also sent an expedition to Darfur, and that country, after a stout resistance, was conquered Zobeir claimed to be made governor-general of the new province; his request being refused, he went to Cairo to urge his claim. At Cairo he was detained by the Egyptian authorities.

Though spasmodic efforts were made to promote agriculture and open up communications the Sudan continued to be a constant drain on the Egyptian exchequer. A project to link Wadi Halfa to Khartoum by railway was abandoned (1877) after 50m. of rails had been laid in five or six years at a cost of £450,000 In Oct 1876 Gordon left the Equatorial Provinces and gave up his appointment. In Feb. 1877, under pressure from the British and Egyptian Governments, he went to Cairo, where he was given the governorship of the whole of the Egyptian territories outside Egypt; namely, the Sudan provinces proper, the Equatorial Provinces, Darfur and the Red sea and Somali coasts Gordon remained in the Sudan until Aug 1879. During his tenure of office he did much to give the Sudanese the benefit of a just and considerate Government He pacified Darfur and then received the submission of Suliman Zobeir (son of Zobeir Pasha), who was at the head of a gang of slave-traders in the Bahr-el-Ghazal. In 1878 there was further trouble in Darfur and also in Kordofan, and Gordon visited both these provinces, breaking up many companies of slave-hunters. Meantime Suliman (acting on the instructions of his father, who was still at Cairo) had broken out into open revolt against the Egyptians in the Bahr-el-Ghazal. The crushing of Suliman was entrusted by Gordon to Romolo Gessi (1831–81), an Italian who had previously served under Gordon on the Upper Nile. Gessi, after a most arduous campaign (1878–79), defeated and captured Suliman, whom, with other ringleaders, he executed. The slave-raiders were completely broken up and over 10,000 captives released A remnant of Zobeir's troops under a chief named Rabah succeeded in escaping westward (*see* RABAH). Having conquered the province, Gessi was made governor of the Bahr-el-Ghazal, becoming pasha.

When Gordon left the Sudan he was succeeded at Khartoum by Raouf Pasha, under whom the old abuses of the Egyptian administration were revived. At this time the high European officials in the Sudan, besides Gessi, included Emin Pasha (*q.v.*), governor of the Equatorial Province since 1878, and Slatin Pasha (*q v*), governor of Darfur Gessi found his position under Raouf intolerable, resigned his post in Sept 1880 and was succeeded by Frank Lupton, an Englishman and formerly captain of a Red sea merchant steamer. At this period (1880–82) schemes for the reorganization and better administration of the Sudan were elaborated on paper, but the revolt in Egypt under Arabi (*see* EGYPT *History*) and the appearance of a Mahdi intervened

The Rise and Power of Mahdism.—Venality and the extortion of the tax-gatherer flourished anew after the departure of Gordon, while the feebleness of his successors inspired in the Baggara a contempt for the authority which prohibited them pursuing their most lucrative traffic When Mohammed Ahmed (*q v*), a Dongolese, proclaimed himself the long-looked-for Mahdi (guide) of Islam, he found most of his original followers among the grossly superstitious villagers of Kordofan, to whom he preached universal equality and a community of goods, while denouncing the "Turks"—at that time the Sudanese called all foreigners Turks—as unworthy Muslims on whom God would execute judgment The Baggara perceived in this Mahdi one who could be used to shake off Egyptian rule The new Mahdi married the daughters of their sheikhs and found in Abdullah, a member of the Taaisha section of the tribe, whom he appointed Khalifa (lieutenant), his chief supporter.

The Mahdi's capture of El Obeid on Jan. 17, 1883, and the annihilation in the November following of an army of over 10,000 men commanded by Hicks Pasha (Col William Hicks [*q.v.*] formerly of the Bombay army) made the Mahdi undisputed master of Kordofan and Sennar. The next month, Dec 1883, saw the surrender of Slatin in Darfur, whilst in Feb 1884 Osman Digna, his amir in the Red sea regions, inflicted a crushing defeat on some 4,000 Egyptians at El Teb near Suakin In April following Lupton Bey, governor of Bahr-el-Ghazal, was sent captive to Omdurman, where he died on May 8, 1888.

Gordon at Khartoum.—On learning of the disaster to Hicks Pasha's army, the British Government (Great Britain having been since 1882 in military occupation of Egypt) insisted that the Egyptian Government should evacuate such parts of the Sudan as they still held, and Gen. Gordon was despatched, with Lt.-col Donald H. Stewart, to Khartoum to arrange the withdrawal of the Egyptian civil and military population. Gordon's instructions, based largely on his own suggestions, were not wholly consistent; they contemplated vaguely the establishment of some form of stable government on the surrender of Egyptian authority, and among the documents with which he was furnished was a firman creating him governor-general of the Sudan. Gordon reached Khartoum on Feb 18, 1884, and at first his mission, which had aroused great enthusiasm in England, promised success. To smooth the way for the retreat of the Egyptian garrisons and civilians he issued proclamations announcing that the suppression of the slave trade was abandoned; that the Mahdi was sultan of Kordofan, and that the Sudan was independent of Egypt. He enabled some thousands of refugees to make their escape to

Aswan and collected at Khartoum troops from some of the outlying stations. By this time the situation had altered for the worse and Mahdism was gaining strength among tribes in the Nile valley at first hostile to its propaganda. Gordon telegraphed to Cairo asking that Zobeir Pasha might be sent to him, his intention being to hand to Zobeir the government. Zobeir (*q.v.*), a Sudanese Arab, was probably the one man who could have withstood successfully the Mahdi. Owing to Zobeir's notoriety as a slave-raider Gordon's request was refused. All hope of a peaceful retreat of the Egyptians was thus rendered impossible.

The Mahdist movement now swept northward and on May 20, Berber was captured by the dervishes and Khartoum isolated. From this time the energies of Gordon were devoted to the defence of that town. After delay, an expedition was sent up the Nile under the command of Lord Wolseley. It started too late to achieve its object, and on Jan. 25, 1885, Khartoum was captured by the Mahdi and Gordon killed. Col. Stewart, Frank Power (British consul at Khartoum) and M. Herbin (French consul), who (accompanied by 19 Greeks) had been sent down the Nile by Gordon in the previous September to give news to the relief force, had been decoyed ashore and murdered (Sept. 18, 1884). The fall of Khartoum was followed by the withdrawal of the British expedition, Dongola being evacuated in June 1885. In the same month Kassala capitulated, but just as the Mahdi had practically completed the destruction of the Egyptian power he died.

The Khalifa's Rule.—The Mahdi was at once succeeded by the khalifa Abdullah, whose rule continued until Sept. 2, 1898, this period in the history of the Sudan being known as the Mahdia. On the date named the khalifa's army was completely overthrown by an Anglo-Egyptian force under Sir H. (afterwards Lord) Kitchener. (*See* EGYPT: *Egypt and Sudan, Campaigns in.*)

The Mahdi had been regarded by his fanatical adherents as the only true commander of the faithful, endued with Divine power to conquer the whole world. He had at first styled his followers dervishes (*i.e.*, religious mendicants) and given them the *jibba* as their characteristic garment or uniform. Later on he commanded the faithful to call themselves *ansar* (helpers), and at the time of his death he was planning an invasion of Egypt. He had liberated the Sudanese from the extortions of the Egyptians, but the people soon found that the Mahdi's rule was even more oppressive. Gradually all chiefs and amirs not of the Baggara tribe were got rid of except Osman Digna, whose sphere of operations was on the Red sea coast. Abdullah's rule produced complete agricultural and commercial ruin. He was also almost constantly in conflict either with the Shilluks, Nuers and other negro tribes of the south; with the peoples of Darfur, where at one time an anti-Mahdi gained a great following; with the Abyssinians; with the Kabbabish and other Arabic speaking tribes who had never embraced Mahdism, or with the Italians, Egyptians and British. Notwithstanding all this opposition the khalifa found in his own tribesmen and in his black troops devoted adherents and he successfully defended his position. The attempt to conquer Egypt ended in the total defeat of the dervish army at Toski (Aug. 3, 1889). The attempts to subdue the Equatorial Provinces were but partly successful. Emin Pasha, to whose relief H. M. Stanley had gone, evacuated Wadelai in April 1889. The greater part of the region and also most of the Bahr-el-Ghazal relapsed into a state of chaos.

Pilgrimages to the Mahdi's tomb at Omdurman were substituted for pilgrimages to Mecca. The arsenal and dockyard and the printing-press at Khartoum were kept busy (the workmen being Egyptians who had escaped massacre). Otherwise Khartoum was deserted, the khalifa making Omdurman his capital. The population of the country dwindled from warfare and disease, small-pox being endemic.

The European captives were kept prisoners at Omdurman. Besides ex-officials like Slatin and Lupton, they included several Roman Catholic priests and sisters, and numbers of Greek merchants established at Khartoum. Although several were closely imprisoned, loaded with chains and repeatedly flogged, it is a noteworthy fact that none was put to death. From time to time a prisoner, among them Slatin, made his escape.

The khalifa, when defeated, fled to Kordofan where he was killed in battle in Nov. 1899. In Jan. 1900 Osman Digna, a fugitive, was captured. As in 1903 and 1908, other Mahdis arose, but they were captured and hanged.

The Anglo-Egyptian Condominium.—Of the cause which led to the reconquest of the Sudan the most weighty was the necessity of securing control of the Upper Nile, Egypt being wholly dependent on the waters of the river for its prosperity. France was endeavouring to establish her authority on the river between Khartoum and Gondokoro, as the Marchand expedition from the Congo to Fashoda demonstrated.

The Sudan having been reconquered by "the joint military and financial efforts" of Great Britain and Egypt, the British Government claimed "by right of conquest" to share in the settlement of the administration and legislation of the country. To meet these claims an agreement between Great Britain and Egypt was signed on Jan. 19, 1899, establishing the joint sovereignty of the two States throughout the Sudan. The reorganization of the country had already begun, supreme power being centred in an official termed the "governor-general of the Sudan," who by the terms of the agreement is appointed on the recommendation of the British Government. Thus in effect Great Britain controlled the Sudan. Lord Kitchener, the sirdar (commander-in-chief) of the Egyptian army, under whom the Sudan had been reconquered, was the first governor-general. On Kitchener's departure to South Africa, at the close of 1899, he was succeeded as sirdar and governor-general by Maj.-gen. Sir F. R. Wingate, who had served with the Egyptian army since 1883. Wingate remained as governor-general and sirdar until Dec. 1916, when he was appointed high commissioner for Egypt. With Wingate served Slatin Pasha as inspector-general and his knowledge of native affairs was most valuable. But Slatin was an Austrian, and on the outbreak of the World War his services were lost to the Sudan. Under a just and firm administration, which from the first was essentially civil, though the principal officials were officers of the British army, the Sudan recovered in a surprising manner from the woes it suffered during the Mahdia. At the head of every *mudiria* (province) was placed a British official, though many of the subordinate posts were filled by Egyptians. An exception was made in the case of Darfur, which, before the battle of Omdurman, had thrown off the khalifa's rule and was again under a native sovereign. This potentate, the sultan Ali Dinar, was recognized by the Sudan Government, on condition of the payment of an annual tribute. During the World War Ali Dinar revolted; an expedition under Lt.-col. P. V. Kelly inflicted a crushing defeat on the Darfurians outside the capital, El Fasher, on May 22, 1916. The Sultan fled and was killed in action in the following November. Darfur had meanwhile been incorporated as a province in the Sudan.

The first duty of the new administration, the restoration of public order, met with comparatively feeble opposition, though tribes such as the Nuba mountaineers, accustomed from time immemorial to raid their weaker neighbours, gave some trouble. The delimitation (1903–04) of the frontier between the Sudan and Abyssinia helped in the restoration of order in a particularly lawless region but occasional raids by Abyssinians across the border for slaves were reported as late as 1926.

With good administration and public security the population increased steadily. The Sudan Government devoted much attention to the revival of agriculture and commerce, to the creation of an educated class of natives, and to the establishment of an adequate judicial system. It was made easier by the decision to govern, as far as possible, in accordance with native law and custom, no attempt being made to Egyptianize or Anglicize the Sudanese. The Arab-speaking and Mohammedan population found their religion and language respected, and showed a marked desire to profit by the new order. To the negroes of the southern Sudan, who were exceedingly suspicious of all strangers—whom hitherto they had known almost exclusively as slave-raiders—the very elements of civilization had, in most cases, to be taught. In these pagan regions the Sudan Government encouraged the work of missionary societies, both Protestant and Roman Catholic, while discouraging propaganda work among the Muslims.

Basis of Prosperity.—In their general policy the Sudan Government adopted a system of light taxation. Prosperity was largely the result A short route to the sea being essential, a railway from the Nile near Berber to the Red sea was built (1904–06). It shortened the distance from Khartoum to the coast by nearly 1,000 miles. Sir Eldon Gorst (high commissioner in Egypt) after a tour of inspection declared in his report for 1909, "I do not suppose that there is any part of the world in which the mass of the population have fewer unsatisfied wants."

The next development came out of the search for new cotton-fields by the British Cotton Growing Association. Experiments had been made in 1911 as to whether long staple cotton could profitably be grown in the Gezira (the "island" between the White and Blue Niles immediately above Khartoum). At that time a railway was being built from Khartoum along the edge of the Gezira to Sennar and thence to Kordofan. This railway was opened in 1912; it brought the Gezira within easy reach of Khartoum besides rendering more easily accessible the rich gum and cattle areas of Kordofan. In the same year the Cotton Growing Association experts who had visited the Sudan reported enthusiastically upon its cotton growing possibilities, with the result that in 1913 the British parliament guaranteed a loan of £3,000,000 for irrigation and railway schemes. Just at this time (1913–14) the value of any project which would give to large areas adequate water supplies by means of artificial irrigation received a striking demonstration The 1913 rains were very bad and the river flood was the lowest recorded for more than a century, so that all over the northern Sudan, and particularly in the Gezira area, famine conditions obtained during the following winter. The situation was saved by the Government importing corn from India, and it is probable that this contributed more than any other factor to the quiet in the Sudan during the World War.

The World War and After.—Fortunately rains and Nile flood alike were excellent in 1914 But Sudanese came into touch with European thought as well as European markets. The agitation among the Egyptian Nationalists for the ejection of the British from the Sudan was not without effect, and the national self-consciousness which is dormant in every race showed signs of awakening among that section of the people, mainly town dwellers, most receptive of new ideas. Happily 1920 was a year of prosperity, rich harvests and increasing trade, and the interests of the classes in question was largely centred on money making and the possibilities of the Gezira irrigation scheme, on which preliminary work was being actively prosecuted. The Sudan, too, had the advantage of very able and sympathetic government under Sir Lee Stack who had succeeded Sir Francis Wingate as governor-general and sirdar. He was fully in sympathy with a recommendation made by the Milner Commission in 1920 that a policy should be pursued of "decentralization and the employment, wherever possible, of native agencies for the simple administrative needs of the country." This was indeed no new policy in the Sudan, but its authoritative restatement had value

The only hindrance to an ordered and healthy political evolution in the Sudan, came as a reaction from political disturbances in Egypt. The Milner Commission recommended that whatever change was made in the relation between Great Britain and Egypt, British predominance in the Sudan should not be affected. Accordingly, when in Feb 1922 the independence of Egypt was declared, provision was made for the maintenance of the *status quo* in the Sudan But the Nationalist party in Egypt demanded the handing over of the Sudan to Egypt and again conducted an active anti-British campaign of propaganda in the Sudan. There the position was complicated by the fact that the military garrison was furnished by the Egyptian army, consisting partly of purely Egyptian units but mainly of locally recruited units officered by Egyptians and Sudanese with a small addition of British officers. A "White Flag League" with funds from Egypt had been started in the Sudan, and a few disturbances occurred, including mutinies of the Egyptian Railway Battalion at Atbara, and of Sudanese cadets in Khartoum, in Aug. 1924, but the country was quiescent.

In Sept. and Oct. 1924 conversations took place in London between the prime minister (Ramsay MacDonald) and Zaghlul Pasha (prime minister of Egypt) in which the position of the Sudan as well as Egypt was discussed. No agreement was reached, whereupon MacDonald sent a despatch (Cmd. 2269 of 1924) to the British High Commissioner in Cairo in which, referring to the Sudan, he said:

> . . . In the meantime, the duty of preserving order in the Sudan rests, in fact, upon His Majesty's Government, and they will take every step necessary for this purpose. Since going there they have contracted heavy moral obligations by the creation of a good system of administration; they cannot allow that to be destroyed, they regard their responsibilities as a trust for the Sudan people; there can be no question of their abandoning the Sudan until their work is done. His Majesty's Government have no desire to disturb existing arrangements, but they must point out how intolerable is a *status quo* which enables both military and civil officers and officials to conspire against civil order, and unless the *status quo* is accepted and loyally worked out until such time as a new arrangement may be reached, the Sudan Government would fail in its duty were it to allow such conditions to continue. .

The failure of Zaghlul in London left him without any constructive policy for dealing with the Sudan, and the forces of disorder asserted themselves. On Nov. 20, 1924, Sir Lee Stack succumbed to a murderous attack made on him in the streets of Cairo. An ultimatum was thereupon presented by the British Government and among its terms was the immediate withdrawal of all Egyptian troops from the Sudan, *i e*, all purely Egyptian units and the Egyptian officers of the Arab and Sudanese units The demand was refused, and on Nov. 23 orders were issued for their compulsory removal. Some of them departed without demur; others adopted an attitude of passive resistance. At this stage some black Sudanese detachments stationed in Khartoum, probably misunderstanding the exact position of affairs, and certainly instigated by the Egyptian officers and by sympathisers among their own officers, mutinied on Nov. 27, and it was not until the 29th that order was restored. The evacuation of the Egyptian units and personnel was followed by the creation of a Sudan defence force, consisting of Sudanese and Arab units which had hitherto been incorporated in the Egyptian army. The new force undertook allegiance solely to the governor-general of the Sudan who was no longer also sirdar of the Egyptian army By the end of 1924 conditions had been restored to normal.

Sir Geoffrey Archer, a man of much experience of African races, became governor-general in Jan. 1925 He put into fuller practice the principle of decentralized control—that is, leaving the administration as far as possible in the hands of the native authorities On account of ill-health Sir Geoffrey resigned his post in 1926, Sir John Maffey, who succeeded him, adopted fully Archer's devolutionary policy and in 1927 a measure was passed ("Powers of Sheikhs ordinance") which strengthened the authority of the chiefs over their tribes as judges in criminal and civil cases A notable event was the opening in Jan. 1926 of the Sennar dam, which brought a great part of the Gezira under irrigation. A particularly satisfactory feature of this work was its popularity among the native owners and cultivators. While 1925 and 1926 were both years of drought in the northern Sudan, the material progress of the people continued; the Government established a central reserve of grain and controlled prices

Among the pagan negroid tribes of the southern Sudan probably the greatest agent in development was the building of roads as adjuncts to river transport; by 1928 thousands of miles of road were in use by motor traffic in the dry season This opened up markets and led to the introduction of money, and the cultivation of food crops and of cotton. Whether they desired it or not these backward races felt the impact of new methods and agencies. The first steps in their transformation, the stopping of inter-tribal warfare and the establishment of public order, were slowly accomplished, mainly by the personal influence of British officials. One difficulty was that the Government had not forces sufficient effectively to control the border region. To help in this matter there were in 1914 and again in 1926, territorial rearrangements in the south (*see* UGANDA). In administered areas peaceful progress was not uninterrupted. There was a somewhat serious rising among a section of the Dinkas in Mongalla province in 1919, during which the governor, Maj. C. H Stigand, and Maj. R F. White lost their

lives, their small force being attacked by spearmen in the long grass. Punitive measures followed in 1920 and the Dinkas gave little trouble thereafter; some of them took to cotton growing and coffee planting. There was unrest among the Nuer of the Bahr-el-Ghazal province in 1927 and Capt. V. H. Fergusson, district commissioner, with several other persons, was murdered in December of that year. Aeroplanes were used in the retributory action taken.

In March 1928 a new draft treaty between Great Britain and Egypt was rejected by the Egyptian cabinet; whereupon the British Government reminded the Egyptian Government that under the agreement of 1899, Great Britain continued to control the Sudan.

By an exchange of notes on May 7, 1929, an agreement, satisfactory to both parties, was reached by the British and Egyptian Governments in regard to Nile irrigation schemes. It was agreed that no measures, such as supplying the needs of the northern Sudan, should be taken which would prejudice the interests of Egypt, and that there should be co-operation between the Egyptian and Sudanese irrigation services. The immediate effect of the agreement was to allow the Egyptian authorities at once to proceed with the construction of a dam across the White Nile at Gebel Aulia, 30 m. above Khartoum—a project of special importance to Egypt, and in no way affecting the Gezira scheme of the Sudan Government.

Macmichael, *A History of the Arabs in the Sudan*, 2 vols. (Cambridge, 1922). The Egyptian conquest and events up to 1850 are summarized in H. Deherain, *Le Soudan égyptien sous Mehemet Ali* (1898). For the middle period of Egyptian rule *see* Sir S. Baker, *Ismailia* (1874); *Colonel Gordon in Central Africa*, edit. G. Birkbeck Hill (4th ed., 1885), being extracts from Gordon's diary (1874–80); R. Buchta, *Der Sudan unter ägptischer Herrschaft* (Leipzig, 1888); Romolo Gessi Pasha, *Seven Years in the Soudan* (1892). The rise of Mahdism and events down to 1900 are set forth in F. R. Wingate, *Mahdiism and the Egyptian Sudan* (1891), containing translations of letters and proclamations of the Mahdi and Khalifa. For this period see *Journals of Major General Gordon at Khartoum* (1885); E. Power, *Letters from Khartoum during the Siege* (1885), and the following four books written by prisoners of the dervishes are especially valuable: Father J. Ohrwalder, *Ten Years' Captivity in the Mahdi's Camp 1882–92* (1892); Slatin Pasha, *Fire and Sword in the Sudan* (1896); Father Paolo Rosignoli, *I miei dodici Anni di prigionia in mezzo ai dervice del Sudan* (Mondovi, 1898); C. Neufeldt, *A Prisoner of the Khaleefa* (1899); G. Dujarric, *L'Etat mahdiste du Soudan* (1901). For the Fashoda incident, besides the British and French official despatches, *see* R. de Caix, *Fachoda, la France et l'Angleterre* (1899); A. Lebon, *La Politique de la France, 1896–98* (1901); G. Hanotaux, *Fachoda* (1910). *See* also Lord Cromer, *Modern Egypt* (1908)—for Sudanese history for the years 1881–1907. The annual reports on the Sudan published by the Foreign Office, London, are of much value.

(F. R. C.)

SUDAN, CAMPAIGNS IN: *see* Egypt and Sudan, Campaigns in, 1882–1899.

SUDAN, FRENCH, one of the colonies of French West Africa, of which the area is now 1,672,000 sq.km. (a third of French West Africa); population, 2,635,000, of which 1,500 only are Europeans. The colony of Upper Volta was separated from it in 1919; French Sudan, for several years called Upper Senegal and Niger, took its present name in 1920. Those tribes living north and east of the Niger are mainly of Berber (Tuareg) stock; the inhabitants of the Niger bend are chiefly Negroids, such as the Mandingo, with Fula in certain districts.

The colony, as a whole, consists of a great plateau of granite and sandstone, rarely more than 1,600 ft. high. Hydrographically the western portion belongs to the basin of the Senegal, the central to that of the Niger. At Mopti, 200 m. S.W. of Timbuktu, the Niger receives the Bani, which rises in about 9½° N. and with its tributaries drains a very large area. In its lower courses its divergent channels, uniting with offshoots from the Niger, form in the flood season an immense lake. The lakes or widenings of the Niger itself occupy vast areas; Lake Debo, the Lake of Horo, the Lake of Dauna and Lake Faguibini are all to the south or west of Timbuktu, and are permanent. Towards the south the country is somewhat mountainous. The country west of the Niger contains patches of forest, but it consists mainly of open land well adapted to agriculture and stock-raising. The fauna includes the lion, elephant, hippopotamus, wild boar, panther and various kinds of antelope. The climate is tropical.

Of the old native States included in the colony, Bambuk lies between the Senegal and the Faleme and Bafing. It is traversed from north-west to south-east by the steep and wall-like range of the Tamba-Ura mountains. The soil in a large part of the country is of remarkable fertility; rice, maize, millet, melons, manioc, grapes, bananas and other fruits grow abundantly; the forests are rich in a variety of valuable trees; and extensive stretches are covered with abundant pasturage of the long guinea-grass. The inhabitants, a branch of the Mandingo race, own large herds of cattle and sheep. The reports which reached Europe during the 17th and 18th centuries of a country in Upper Senegal rich in gold, referred to this district, where both alluvial and quartz deposits have been found.

Towns.—Kayes (pop. 10,000, of which 200 are Europeans) is situated on the Senegal at the point at which that river ceases to be navigable from the sea—a distance of 460 m. from St. Louis. Bamako (pop. 16,000, of which 600 are Europeans), chosen in 1904 as the capital of the colony, is on the upper Niger at the head of its navigable waters, and is in railway communication with Kayes; the military and administrative buildings stand on the healthy plateau of Koulouba, which overlooks the commercial town and the river. Segu, where Mungo Park first reached the Niger, is a series of townships stretching for 15 km. along the river (pop. 6,000). Before the French occupation the possessor of Segu was the ruler of the surrounding country; and the town was the headquarters of the emirs Omar and Ahmadu. Sansandig stands on the north bank of the Niger below Segu. It was visited by Mungo Park in 1796, and Lieut. E. Mage and Dr. Quintin, French officers, witnessed its stand in 1865 against a siege by Ahmadu, sultan of Segu, from whom it had revolted. Before its conquest by the Tuareg, in the first half of the 19th century, Sansandig was an important mart.

Communications.—There is regular communication by rail and river between Dakar, the principal port of Senegal, and Timbuktu, the journey occupying 10 to 12 days. A railway linking the Senegal and Niger rivers starts at Kayes on the Senegal, passes south-east through Bafulabé and Kita, whence it goes east to Bamako on the Niger, and follows the left bank of that river to Kulikoro, the terminus, from which point the Niger is navigable down stream all the year round for a distance of 900 m., while from Bamako the Niger is navigable up stream to Kurussa, a distance of 225 m., for most of the year. The Senegal-Niger railway, opened in 1905, is 347 m. long. Steamers ply on the Niger between Kabara, the port of Timbuktu, and Kulikoro and Bamako. There is a complete system of telegraphic communication with all the French colonies in West Africa.

Trade and Agriculture.—The chief exports are gum (which comes largely from the northern districts such as Kaarta), rubber, gold, kola nuts, leather and ostrich feathers. A goodly proportion of the exports from the middle Niger are shipped from Konakry in French Guinea. Under the direction of French officials, cotton-growing on scientific methods was begun in the Niger basin in 1904. American and Egyptian varieties were introduced, the American varieties proving well adapted to the soil. Indigenous varieties of cotton are common and are cultivated by the natives for domestic use, weaving being a general industry. Large works are planned at Segu, at Nyamina and at Sansandig, in view of cotton-growing on a large scale; the execution of the irrigation works is made difficult by the scarcity of labour. Gold is found in the basin of the Faleme and of the Tankisso. The people are great agriculturists, their chief crops being millet, maize, rice, cotton and indigo. Tobacco is cultivated by the river folk along the banks inundated by the floods. Wheat is grown in the neighbourhood of Timbuktu, the seed having been, in all probability, brought from Morocco at the time of the Moorish invasion. (*See* Timbuktu.) The oil of the karite or shea-butter tree, common in the southern and western regions, is largely used. Cattle are plentiful; there are several

good breeds of horses; donkeys are numerous and largely used as transport animals; wool-bearing sheep—distinct from the smooth-haired sheep of the coast regions—are bred in many districts, the natives using the wool largely in the manufacture of blankets and rugs. The imports are valued at 86 millions, and the exports seem to reach nearly the same figure. (A. Be)

SUDANIC LANGUAGES. This term is applied to a number of languages spoken by Negro and other peoples from Abyssinia to Nigeria. At present sixteen main divisions are recognized 1) Nilo-Chad, a group with thirty languages, including Zebu, Kunama, Kanuri; 2) Nilo-Abyssinian (15 languages), including Shilluk, Nuer and Dinka. 3) Nilo-Equatorial (26 languages) including Bari, Turkana, Suk, Nandi, Masai. 4) Kordofan (10 languages) including Talodi and Lumun. 5) Nilo-Congo (19 languages) including Madi, Mangbetu and Lega. 6) Ubangian group (25 languages) including Zande, Gola and Seri. 7) Chari-Wadain (12 languages) including Bongo, Kaba and Sara. 8) Charian (15 languages) including Sokoro, Bwa, and Mana. 9) Nigero-Chad (31 languages) including Kuri, Fali, Bata, Angas and Hausa. 10) Nigero-Cameroons (66 languages) including Gwala, Nde, Kpe, Ejik, Ibo, Nupe, Yoruba 11) Lower-Niger group consists of Idyo or Boni In the 12th or Voltaic group are 53 languages including Tem, Mampuru, Kasena, Ga, Kulango, Semu. In the 13th or Ivory Coast Dahomy group are 48 languages inclusive of the Ewe group, the Tchi group and the Fanti and Abron The 14th or Niger-Senegal group has 36 languages including Mandingo, Vai and Mende The 24 languages spoken on the Ivory-Liberian coast (15th group) include Bete, Kwa and Ne. To the 16th or Senegal-Guinea group belong 24 languages, comprising Timne, Walof, Kisi. Certain traces are found of the noun classifications conspicuous in Bantu languages. The distinction between noun and verb is weak. Kanuri, Hausa and Peul are sometimes written by the use of Arabic letters

See A Meillet and M Cohen, *Les Langues du Monde* (1924); W. Schmidt, *Die Sprachfamilien und Sprachen-Kreise der Erde* (1927).

SUDAN PLANTATIONS SYNDICATE, LTD., a British joint-stock company formed in 1904, with a capital of £80,000, as the Sudan Experimental Plantations Syndicate, Ltd In 1928 the capital stood at £2,250,000.

By an agreement with the Sudan Government, the syndicate was to develop an area of about 100,000 acres of the Gezira plain, irrigated by a barrage across the Blue Nile. The Sudan Government had to provide the land and the major canalization, and the syndicate and the native tenant cultivator were each entitled to receive a share of the proceeds of the crops. The World War supervening, the building of the Sennar dam was delayed, but by means of additional pumping stations the area under cotton was increased to some 22,500 acres.

The agreement was to be in force until 1925, but since the completion of the Sennar dam a new agreement has taken its place, extending to 1950, and providing for certain reductions in the syndicate's share of the crop as compared with its participation of 25% under the old agreement. The syndicate prepares and irrigates the land, letting it to natives, who plant cotton and various leguminous crops under supervision, under three years' rotation The syndicate acts as bankers to the tenants, to whom they make loans on the security of their crops.

The shipments of cotton to the United Kingdom have grown:

	Bales		Bales
1914–15 Gezira	3,935	Zeidab	3,109
1926–27 Gezira	113,168	Zeidab	3,042

The syndicate has in operation four factories of 80 gins each, handling 750 bales per day; two more factories are in course of erection. The cotton, of the Sakellaridis type, is a long and silky staple, commanding a high price. The area under cultivation is to be 150,000 acres in 1929–30. The cotton exported from the Sudan in 1911 was 22,823 bales; in 1926 it had increased to 122,130 bales, of the approximate value of £3,500,000.

(L. C. M.)

SUDATORIUM, in architecture, the vaulted sweating-room (*sudor*, sweat) of the Roman thermae, referred to in Vitruvius (v 2), and there called the *concamerata sudatio.* In order to obtain the great heat required, the whole wall was lined with vertical terra-cotta flue pipes of rectangular section, placed side by side, through which the hot air and the smoke from the hypocaust, or hollow floor, passed to the roof. (*See* BATHS)

SUDBURY, SIMON OF (sometimes called SIMON THEOBALD or TYBALD) (d. 1381), archbishop of Canterbury, was born at Sudbury, in Suffolk, studied at the University of Paris, and became one of the chaplains of Pope Innocent VI, who sent him, in 1356, on a mission to Edward III of England, and in 1361 appointed him bishop of London. From 1375, when he was made archbishop of Canterbury, he was a partisan of John of Gaunt. In July 1377 he crowned Richard II.; in 1378 John Wycliffe appeared before him at Lambeth Chancellor of England from 1380, Sudbury was regarded by the peasants, who were in revolt, as one of the authors of their distress, and the Kentish insurgents damaged his property at Canterbury and Lambeth, and, dragging him from the Tower of London, beheaded the archbishop on Tower hill on June 14, 1381.

See W F. Hook, *Lives of the Archbishops of Canterbury.*

SUDBURY, in northern Ontario, Canada, produces 90% of the world's supply of nickel and almost all the copper produced in Ontario. The smelter of the International Nickel company is at Copper Cliff, a suburb to the west, and the Mond company's smelter and sulphuric acid plant is 8 m. to the east at Coniston A Government school of mines and a Jesuit college are situated here. Deposits of lead and zinc are also being opened up. Pop. (1921), 8,621.

SUDBURY, a market town of England, chiefly in Suffolk, but partly in Essex Pop (1921) 7,045 It lies on the river Stour (which is navigable up to the town) All Saints' parish church is chiefly Perpendicular—the chancel being Decorated. It possesses a fine oaken pulpit of 1490. St. Peter's is Perpendicular, with a finely carved nave roof. St. Gregory's, once collegiate, is Perpendicular. It has a rich spire-shaped font-cover of wood, gilded and painted The grammar school was founded by William Wood in 1491. There are some old half-timbered houses, including one very fine example. Coco-nut matting is an important manufacture; silk manufactures were transferred from London during the 19th century, and horsehair weaving was established at the same time. Before the Conquest the borough was owned by the mother of Earl Morcar, from whom it was taken by William I, who held it in 1086. It was alienated from the Crown to an ancestor of Gilbert de Clare, 9th earl of Gloucester In 1271 the earl gave the burgesses their first charter confirming to them all their ancient liberties and customs They were incorporated in 1553 Weavers were introduced by Edward III

SUDD, a vegetable obstruction on the Upper Nile. It is composed of compacted masses of plants consisting chiefly of a grass, *Vossia procera*, with *Saccharum Spontaneum,* which cover a large area of the Ghazal swamps. Loosened by storms, these plants reach the main channel near the Sobat R. junction, lodge on some obstruction and form a dam, sometimes 25 m. in length and nearly 20 ft. below the surface These peaty blocks of decayed vegetation and soil are compressed by the current so that in parts they can support an elephant At length the pressure of the water forms a side channel or causes the sudd to burst (*See* NILE)

See O. Deuerling, *Die Pflanzenbarren der afrikanischen Flusse* (Munich, 1909), and H. G. Lyons, *The Physiography of the Nile and its Basin* (Cairo, 1906)

SUDERMANN, HERMANN (1857–1928), German writer, was born at Matziken, East Prussia, on Sept 30, 1857, of a Mennonite family long settled near Elbing His father owned a small brewery, but owing to a financial crisis was obliged to apprentice his son, at the age of 14, to a chemist. Young Sudermann was able, however, to study at Tilsit and afterwards at Koenigsberg university. He then went to Berlin, where he acted as tutor in several houses, and worked as a journalist on the Deutsches Reichsblatt (1881–2), afterwards turning to novel-writing. His novels *Im Zwielicht* (1886), *Frau Sorge* (1887), *Geschwister* (1888) and *Der Katzensteg* (1890) revealed neither beauty nor emotional power, but invariably showed keen obser-

vation, a vivid touch and dramatic technique. The tale is his chief concern, and he shows a masterly control of tension, as in *Iolanthes Hochzeit* (1892); *Es War* (1894) and *Das Hohe Lied* (1908) showed a falling off, but the old mastery reappeared in *Litauische Novellen* (1917).

More instantly popular, and later more bitterly decried, were plays, of which *Die Ehre* (1880) brought him immediate fame, and *Heimat* (1892), better known as *Magda*, made him known throughout Europe. Part of the great success of *Magda* was no doubt due to the fact that the title-rôle was interpreted by Modjeska, Bernhardt, Duse, and Mrs. Patrick Campbell. His dramas, *Sodoms Ende* (1891), *Johannisfeuer* (1900), *Es Lebe Das Leben* (1912), *Der Sturmgeselle Sokrates* (1903), *Stein Unter Den Steinen* (1915) and numerous others ending with *Der Hasenfellhändler* (1925) were uniformly successful on the stage. During the World War he wrote the cycle of three plays collectively entitled *Die Entygötterte Welt.* His last novels were *Der tolle Professor* (1926) and *Purzelchen* (1928). He belonged to the realistic movement of the last quarter of the 19th century, and was not very sympathetic to the new methods and new outlook of post-war literature. He died at Berlin on Nov. 22, 1928.

See W. Kawerau, *Sudermann* (1897); H. Landsberg, *Sudermann* (1902); H. Jung, *Sudermann* (1902); H. Schoen, *Sudermann, Poete dramatique et romancier* (1905); and I. Axelrod, *Sudermann* (1907). His dramatic works were collected in 1923. *See* also his autobiography *Das Bilderbuch meiner Jugend* (Eng. trans., N.Y. 1924).

SUE, EUGÈNE [Joseph Marie] (1804–1857), French novelist, was born in Paris on Jan. 20, 1804. He was the son of a distinguished surgeon in Napoleon's army, and is said to have had the empress Josephine for godmother. Sue himself acted as surgeon both in the Spanish campaign undertaken by France in 1823 and at the battle of Navarino (1828). In 1829 his father left him a fortune, and he settled in Paris. His naval experiences supplied much of the materials of his first novels. In the quasi-historical style he wrote *Jean Cavalier, ou Les Fanatiques des Cevennes* (4 vols., 1840) and *Latréaumont* (2 vols., 1837). He was strongly affected by the Socialist ideas of the day, and these prompted his most famous works: *Les Mystères de Paris* (10 vols., 1842–1843) and *Le Juif errant* (10 vols., 1844–1845), which were among the most popular specimens of the *roman-feuilleton.* He followed these up with some singular and not very edifying books: *Les Sept péchés capitaux* (16 vols., 1847–1849), which contained stories to illustrate each sin, *Les Mystères du peuple* (1849–1856), which was suppressed by the censor in 1857.

Some of his books, among them the *Juif errant* and the *Mystères de Paris*, were dramatized. After the revolution of 1848 he sat for Paris (the Seine) in the Assembly, and was exiled after his protest against the *coup d'état* of Dec. 2, 1851. His later works were inferior. Sue died at Annecy (Savoy) on Aug. 3, 1857.

SUEBI or **SUEVI,** a collective term applied to a number of peoples in central Germany, the chief of whom were the Marcomanni, Quadi, Hermunduri, Semnones, and Langobardi; these tribes inhabited the basin of the Elbe. Tacitus uses the name Suebi in a wider sense to include not only the tribes of the basin of the Elbe, but all the tribes north and east of that river, including even the Swedes (Suiones).

From the 2nd to the 4th century A.D. the name Suebi is seldom used except with reference to events in the neighbourhood of the Pannonian frontier, and here probably means the Quadi. From the middle of the 4th century it appears in the regions south of the Main, and the names Alamanni and Suebi are used synonymously. The Alamanni (*q.v.*) seem to have been joined by one or more other Suebic peoples, some of whom accompanied the Vandals in their invasion of Gaul and founded a kingdom in north-west Spain. Besides the Alamannic Suebi we hear of a people called Suebi, who shortly after the middle of the 6th century settled north of the Unstrut. There is evidence also for a people called Suebi in the district above the mouth of the Scheldt. It is likely that both these settlements were colonies from the Suebi of whom we hear in the Anglo-Saxon poem *Widsith* as neighbours of the Angli. The question has been raised whether these Suebi should be identified with the people whom the Romans called Heruli. After the 7th century the name Suebi is practically only applied to the Alamannic Suebi (Schwaben), with whom it remains a territorial designation in Württemberg and Bavaria.

Zeuss, *Die Deutschen und die Nachbarstämme*, pp. 55 *et seq.*, 315 *et seq.*; C. Bremer in Paul's *Grundriss* (2nd ed.), iii. 915–950; H. M. Chadwick, *Origin of the English Nation*, 216 *et seq.* (Cambridge, 1907).

SUECA, a town of eastern Spain, in Valencia. Pop. (1920), 17,915. Sueca is separated from the Mediterranean Sea (7 m. east) by the Sierra de Cullera. It is a modern town, although many of the houses have the flat roofs, view-turrets (*miradores*) and horseshoe arches characteristic of Moorish architecture. Sueca has a thriving trade in grain and fruit from the Júcar valley, which is irrigated by waterways created by the Moors.

SUEDE FINISH, a nap produced by separating the surface fibres of leather on a carborundum or emery wheel. Although this processing may be directed either at the grain of leather or the flesh surface, it is more often applied to the latter. Suede finish usually indicates chrome or alum tanning as opposed to vegetable tanning, and the resulting leather is soft, pliable and strong. It is used for shoes, hats, coats, gloves, belts and handbags.

SUESSULA, an ancient town of Campania, Italy. It commanded the entrance to the Caudine pass. (*See* Caudine Forks.) Traces of the theatre may still be seen. Oscan tombs were excavated, and vases, bronzes, etc., have been found. Suessula lay on the Via Popilia. On the hills above Cancello to the east of Suessula was situated the fortified camp of M. Claudius Marcellus, used as an outpost against Hannibal in Capua. (*See* Punic Wars.)

SUETONIUS TRANQUILLUS, GAIUS, Roman historian, lived during the end of the 1st and the first half of the 2nd century A.D. He was the contemporary of Tacitus and the younger Pliny, and his literary work seems to have been chiefly done in the reigns of Trajan and Hadrian (A.D. 98–138). His father was military tribune in the XIIIth legion, and he himself began life as a teacher of rhetoric and an advocate. To us he is known as the biographer of the twelve Caesars (including Julius) down to Domitian. As Hadrian's private secretary (*magister epistolarum*), he must have had access to the Imperial archives, *e.g.*, the transactions of the senate. He was a correspondent of the younger Pliny, who as governor of Bithynia took Suetonius with him. Hadrian's biographer, Aelius Spartianus, tells us that Suetonius was deprived of his private secretaryship because he had not been sufficiently observant of court etiquette towards the emperor's wife during Hadrian's absence in Britain.

The *Lives of the Caesars* is rather a chronicle than a history. It gives no general picture of the period. It is the emperor who is always before us, yet the portrait is drawn without real insight. The personal anecdotes are very amusing; but the author panders too much to a taste for gossip. None the less he is next to Tacitus and Dio Cassius the chief (sometimes the only) authority. The language is clear and simple. Of his *De viris illustribus*, the lives of Terence and Horace, fragments of those of Lucan and the elder Pliny and the greater part of the chapter on grammarians and rhetoricians, are extant. Other works by him (now lost) were: *Prata* (=λειμῶνες=patch-work), in ten books, a kind of encyclopaedia; the *Roman Year, Roman Institutions and Customs, Children's Games among the Greeks, Roman Public Spectacles, On the Kings, On Cicero's Republic.*

Editio princeps, 1470; editions by great scholars: Erasmus, Isaac Casaubon, J. G. Graevius, P. Burmann; the best complete annotated edition is still that of C. G. Baumgarten-Crusius (1816); recent editions by H. T. Peck (New York, 1889); Leo Preud'homme (1906); M. Ihm (1907) of the *De viris illustribus*, R. P. Robinson, (Paris 1925). Editions of separate lives: *Augustus*, by E. S. Shuckburgh (with useful introduction, 1896); *Claudius*, by H. Smilda (1896); *Julius Caesar*, by Butler and Cary (Oxford 1927); *Vespasian*, by Braithwaite (Oxford 1927). The best editions of the text are by C. L. Roth (1886), and A. Reifferscheid (not including the *Lives*, 1860). On the *De viris illustribus*, *see* G. Körtze in *Dissert. philolog. halenses* (1900), vol. xiv.; and, above all, A. Macé, *Essai sur Suétone* (1900), with an exhaustive bibliography. There are English translations by Philemon Holland (reprinted in the *Tudor Translations*, 1900), by Thomson and Forester (in Bohn's *Classical Library*), and by Page and Rouse in the *Loeb* series (1912).

SUEZ, a port of Egypt on the Red Sea and southern terminus of the Suez Canal. Pop. about 20,000. Suez is supplied with water by the fresh-water canal, which starts from the Nile at Cairo and was opened in 1863. Before this, water had to be brought from "the Wells of Moses," a small oasis 3 m. distant About 2 m. south of the town are the quays constructed on the Canal and connected with the town by an embankment. On one of the quays is a statue to Thomas Waghorn, the organizer of the "overland route" to India The ground on which the port is built has all been reclaimed from the sea. The accommodation provided includes a dry dock 410 ft long, 100 ft broad and nearly 36 ft. deep. There are separate basins for warships and merchant ships, and in the roadstead at the mouth of the canal is ample room for shipping Suez is a quarantine station for pilgrims from Mecca.

In the 7th century a town called Kolzum stood, on a site adjacent to that of Suez, at the southern end of the canal which then joined the Red Sea to the Nile. On the Ottoman conquest of Egypt in the 16th century Suez became a naval as well as a trading station, and here fleets were equipped which for a time disputed the mastery of the Indian Ocean with the Portuguese. According to Niebuhr, in the 18th century a fleet of nearly twenty vessels sailed yearly from Suez to Jidda, the port of Mecca and the place of correspondence with India The overland mail route from England to India by way of Suez was opened in 1837. The regular Peninsular and Oriental steamer service began a few years later, and in 1857 a railway was opened from Cairo through the desert. The present railway follows the canal from Suez to Ismailia and Zagazig, whence branches diverge to Cairo and Alexandria.

SUEZ, COMPAGNIE UNIVERSELLE DU CANAL MARITIME DE. The first concession of territory to M. Ferdinand de Lesseps was in 1854 followed in 1856 by a second. In 1858 the Suez Canal Company was formed and the first ground was broken at Port Said on April 25, 1859. After many vicissitudes and in the face of much opposition the work was completed in ten years and on Nov 17, 1869, 68 ships passed through from the Mediterranean to the Red Sea. The original public list opened on Nov. 5, 1858, and offered 400,000 shares at Fr. 500 per share.

Questions concerning the regulation of measurements and tonnage to fix the dues upon traffic passing through the canal were finally adjusted by the findings of an International Commission at Constantinople in 1873 Traffic through the canal has increased steadily year by year; in 1923 2,839 ships out of a total of 4,621 were British and the figures for 1927 were, total net tonnage 28,-962,048; total number of ships, 5,545, British ships 3,085. Thus, in that year British ships represented a percentage of 57·1.

The canal is managed in Egypt. The number of employees there in 1928 was 3,011 and the work includes the prolongation of breakwaters, incessant dredging and the widening and straightening of the canal. There are 2,466 workmen so engaged and their salaries (including a share of the profits) amounted in 1928 to £800,000, as contrasted with the £200,000 paid in 1914 to 2,650 workmen. The concession to the Suez Canal Company expires on Nov. 17, 1968. For details as to the depth, width at bottom and breadth between the banks of the Suez Canal, *see* Lloyd's *Register of Shipping* (L. F. O.)

SUEZ CANAL, an artificial waterway, about 100m. long, connecting Port Said, on the Mediterranean sea, and Suez, on the Red sea, which enables ocean-going ships to traverse the isthmus between Asia and Africa, thereby shortening the maritime route from Europe to the Orient by the sailing distance around the continent of Africa At various eras such communication existed by way of the Nile. The fertile Wadi Tumilat extending east of the Nile valley almost to the head of the gulf (which in ancient times reached north to the Bitter lakes) afforded an easy road between the Nile and the Red sea. Aristotle, Strabo and Pliny attribute to the legendary Sesostris (*q.v.*) the distinction of being the first of the pharaohs to build such a canal. From an inscription at Karnak it seems that the canal existed in the time of Seti I. (1380 B C) The channel of this canal is still traceable in parts of the Wadi Tumilat, and its direction was frequently followed by the engineers of the fresh-water canal Pharaoh Necho (609 B.C.) began to build another canal, but it was not completed—according to Herodotus 120,000 men perished in the undertaking. Darius (520 B.C) continued the work of Necho, rendering navigable the channel of the Heroopolite gulf, which had become blocked. Up to this time there appears to have been no connection between the waters of the Red sea and those of the

On the left, the main railway line from Port Said to Cairo and Suez; the Arabian desert stretches away to the right

Bubastis-Heroopolis canal, vessels coming from the Mediterranean ascended the Pelusiac arm of the Nile to Bubastis and then sailed along the canal to Heroopolis, where their merchandise had to be transferred to the Red sea ships. Ptolemy Philadelphus (285 B.C) connected the canal with the waters of the sea, and at the spot where the junction was effected he built the town of Arsinoë The dwindling of the Pelusiac branch of the Nile rendered this means of communication impossible by the time of Cleopatra (31 B C.) Trajan (A.D 98) is said to have repaired the canal, and, as the Pelusiac branch was no longer available for navigation, to have built a new canal between Bubastis and Babylon (Old Cairo), this new canal being known traditionally as Amnis Trajanus or Amnis Augustus. According to H R. Hall, however, "It is very doubtful if any work of this kind, beyond repairs, was undertaken in the times of the Romans; and it is more probable that the new canal was the work of 'Amr" (the Arab conqueror of Egypt in the 7th century) The canal was certainly in use in the early years of the Muslim rule in Egypt; it is said to have been closed *c* A.D. 770 by order of Abū Ja'far (Mansur), the second Abbasid caliph and founder of Baghdad, who wished to prevent supplies from reaching his enemies in Arabia by this means 'Amr's canal (of which the Khalig which passed through Cairo and was closed in 1897 is said to have formed part) had its terminus on the Red sea south of the Heroopolite gulf near the present town of Suez. It is not certain that it was ever restored, although it is asserted that in the year 1000 Sultan Hakim rendered it navigable. If so it must speedily have become choked up again. Parts of the canal continued to be filled during the Nile inundations until Mohammed Ali (A D 1811) ordered it to be closed; the closing, however, was not completely effected, for in 1861 the old canal from Bubastis still flowed as far as Kassassin. This part of the canal, after over 2500 years of service, was utilized by the French engineers in building the fresh-water canal from Cairo to Suez in 1861–63 This canal follows the lines of that of 'Amr (or Trajan).

Maritime Canal Projects.—The idea of a canal across the isthmus of Suez was entertained as early as the 8th century A.D. by Hārūn al-Rashīd, who is said to have abandoned the scheme, being persuaded that it would be dangerous to lay open the coast of Arabia to the Byzantine navy. After the discovery of the Cape route to India at the close of the 15th century, the Venetians suggested the scheme to the Egyptians, but the Turks intervened. In 1671 Leibnitz in his proposals to Louis XIV. of France regarding an expedition to Egypt recommended the idea, and the Sheikh al-Balad Ali Bey (*c.* 1770) approved. Bonaparte when in Egypt in 1798 ordered a survey, and the engineer, J. M. Lepère, reported a difference in level of 29 ft. between the Red sea and the Mediterranean. This view was combated by Laplace

and Fourier and was disproved in 1846–47 by the Société d'Études pour le Canal de Suez, organized in 1846 by Prosper Enfantin, the Saint Simonist. Canals at Panama and Suez were part of the Saint Simonist programme for the regeneration of the world. The expert commission appointed by this society reported by a majority in favour of Paulin Talabot's plan, according to which the canal would have run from Suez to Alexandria by way of Cairo.

De Lesseps, 1854.—The society was in a state of suspended animation when in 1854 Ferdinand de Lesseps came to the front as the chief exponent of the idea. He had been associated with the Saint Simonists. His opportunity came in 1854 when, on the death of Abbas Pasha, his friend Said Pasha became viceroy of Egypt. From Said on Nov. 30, 1854, he obtained a concession authorizing him to constitute the Compagnie Universelle du Canal Maritime de Suez, which should construct a ship canal through the isthmus, and soon afterwards in concert with two French engineers, Linant Bey and Mougel Bey, he decided that the canal should run in a direct line from Suez to the Gulf of Pelusium, passing through the depressions that are now Lake Timsa and the Bitter lakes, and skirting the eastern edge of Lake Menzala. In the following year an international commission appointed by the viceroy approved this plan with slight modifications, the chief being that the channel was taken through Lake Menzala instead of along its edge, and the northern termination of the canal moved some 17½m. westward where deep water was found closer to the shore. This plan, according to which there were to be no locks, was the one ultimately carried out, and it was embodied in a second and amplified concession, dated Jan. 5, 1856, which laid on the company the obligation of constructing, in addition to the maritime canal, a fresh-water canal from the Nile near Cairo to Lake Timsa, with branches running parallel to the maritime canal, one to Suez and the other to Pelusium. The concession was to last for 99 years from the date of the opening of the canal between the Red sea and the Mediterranean, after which, in default of other arrangements, the canal passes into the hands of the Egyptian Government. The confirmation of the sultan of Turkey being required, de Lesseps went to Constantinople to secure it, but found himself baffled by British diplomacy; and later in London he was informed by Lord Palmerston that in the opinion of the British Government the canal was a physical impossibility, that if it were made it would injure British maritime supremacy, and that the proposal meant French interference in the East.

Although the sultan's confirmation of the concession was not actually granted till 1866, de Lesseps in 1858 opened the subscription lists for his company, the capital of which was 200 million francs in 400,000 shares of 500 francs each. In less than a month 314,494 shares were applied for; of these over 200,000 was subscribed in France and over 96,000 were taken by the Ottoman empire. From other countries the subscriptions were trifling, and England, Austria and Russia, as well as the United States of America, held entirely aloof. The residue of 85,506 shares was taken over by the viceroy. (These formed part of the 176,602 shares which were bought for the sum of £3,976,582 from the khedive by England in 1875 at the instance of Lord Beaconsfield [*q.v.*].) On April 25, 1859, the work of construction was formally begun, the first spadeful of sand being turned near the site of Port Said, but progress was not very rapid. By the beginning of 1862 the fresh-water canal had reached Lake Timsa, and towards the end of the same year a narrow channel had been formed between that lake and the Mediterranean. In 1863 the fresh-water canal was continued to Suez.

Forced Labour.—So far the work had been performed by native labour; the concession of 1856 contained a provision that at least four-fifths of the labourers should be Egyptians, and later in the same year Said Pasha undertook to supply labourers as required by the engineers of the canal company, which was to house and feed them and pay them at stipulated rates. Although the wages and the terms of service were better than the men obtained normally, this system of forced labour was strongly disapproved of in England, and the khedive Ismail who succeeded Said on the latter's death in 1863 also considered it as being contrary to the interests of his country. Hence in July the Egyptian foreign minister, Nubar Pasha, was sent to Constantinople with the proposal that the number of labourers furnished to the company should be reduced, and that it should be made to hand back to the Egyptian Government the lands that had been granted it by Said in 1856. These propositions were approved by the sultan and the company was informed that if they were not accepted the works would be stopped by force. Naturally the company objected, and in the end the various matters in dispute were referred to the arbitration of the emperor Napoleon III. By his award, made in July 1864, the company was allowed 38 million francs as an indemnity for the abolition of the *corvée*, 16 million francs in respect of its retrocessions of that portion of the fresh-water canal that lay between Wadi, Lake Timsa and Suez (the remainder had already been handed back by agreement), and 30 million francs in respect of the lands which had been granted it by Said. The company was allowed to retain a certain amount of land along the canals, which was necessary for purposes of construction, erection of workshops, etc., and it was put under the obligation of finishing the fresh-water canal between Wadi and Suez to such dimensions that the depth of water in it would be 2½ metres at high Nile and at least 1 metre at low Nile. The supply of Port Said with water it was allowed to manage by any means it chose; in the first instance it laid a double line of iron piping from Timsa, and it was not till 1885 that the original plan of supplying the town by a branch of the fresh-water canal was carried out. The indemnity, amounting to a total of 84 million francs, was to be paid in instalments spread over 15 years.

The abolition of forced labour was probably the salvation of the enterprise, for it meant the introduction of mechanical appliances and of modern engineering methods. The work was divided into four contracts. The first was for the supply of 250,000 cubic metres of concrete blocks for the jetties of Port Said; the second. for the first 60 kilometres of the channel from Port Said, involved the removal of 22 million cubic metres of sand or mud; the third was for the next length of 13 kilometres, which included the cutting through the high ground at El Gisr; and the fourth and largest was for the portion between Lake Timsa and the Red sea. The contractors for this last section were Paul Borel and Alexandre Levalley, who ultimately became responsible also for the second or 60 kilometres contract. For the most part the material was soft and therefore readily removed. At some points, however, as at Shalûf and Serapeum, rock was encountered. Much of the channel was formed by means of dredgers. At Serapeum, a preliminary shallow channel having been dug out, water was admitted from the fresh-water canal, the level of which is higher than that of the ship canal, and the work was completed by dredgers from a level of about 20ft. above the sea.

In 1865 de Lesseps, to show the progress that had been made, entertained over 100 delegates from chambers of commerce in different parts of the world, and conducted them over the works. In the following year the company, being in need of money, realized 10 million francs by selling to the Egyptian Government the estate of El Wadi, which it had purchased from Said, and it also succeeded in arranging that the money due to it under the award of 1864 should be paid off by 1869 instead of 1879. Its financial resources still being insufficient, it obtained in 1867 permission to invite a loan of 100 million francs; but though the issue was offered at a heavy discount it was only fully taken up after the attractions of a lottery scheme had been added to it. Two years later the company got 30 million francs from the Egyptian Government in consideration of abandoning certain special rights and privileges that still belonged to it and of handing over various hospitals, workshops, buildings, etc., which it had established on the isthmus. The Government liquidated this debt, not by a money payment, but by agreeing to forego for 25 years the interest on the 176,602 shares it held in the company, which was thus enabled to raise a loan to the amount of the debt. Altogether, up to the end of the year (1869) in which the canal was sufficiently advanced to be opened for traffic, the accounts of the company showed a total expenditure of 432,807,882 francs, though the International Technical commission in 1856 had estimated the cost at only 200

millions for a canal of larger dimensions.

The Opening, 1869.—The formal opening of the canal was celebrated in Nov. 1869. On the 16th there was an inaugural ceremony at Port Said, and next day 68 vessels of various nationalities, headed by the "Aigle" with the empress Eugénie on board, began the passage, reaching Ismailia (Lake Timsa) the same day. On the 19th they continued their journey to the Bitter lakes, and on the 20th they arrived at Suez. Immediately afterwards regular traffic began. In 1870 the canal was used by nearly 500 vessels, but the receipts for the first two years of working were considerably less than the expenses. The company failed to raise a loan of 20 million francs in 1871, and it was only saved from bankruptcy by a rapid increase in its revenues.

The total length of the navigation from Port Said to Suez is 100m The canal was originally constructed to have a depth of 8 metres with a bottom width of 22 metres, but it soon became evident that its dimensions must be enlarged. Certain improvements in the channel were started in 1876, but a more extensive plan was adopted in 1885 as the result of the inquiries of an international commission which recommended that the depth should be increased first to 8½ metres and finally to 9 metres, and that the width should be made on the straight parts a minimum of 65 metres between Port Said and the Bitter lakes, and of 75 metres between the Bitter lakes and Suez, increasing on curves to 80 metres To pay for these works a loan of 100 million francs was issued. In the early days of the canal, except in the Bitter lakes, vessels could pass each other only at a few crossing places or gares, which had a collective length of less than a mile; but owing to the widenings that have been carried out, passing is now possible at any point over the greater part of the canal, one vessel stopping while the other proceeds on her way. From March 1887 navigation by night was permitted to ships which were provided with electric search-lights. By these measures the average time of transit, which was about 36 hours in 1886, has been reduced by more than one-half; in 1927 the average passage, including stoppages was only 15 hours 6 minutes. The maximum speed permitted in the canal itself is 12 kilometres an hour.

Dues; Neutrality.—The dues which the canal company was authorized to charge by its concession of 1856 were 10 francs a ton In the first instance they were levied on the tonnage as shown by the papers on board each vessel, but from March 1872 they were charged on the gross register tonnage, computed according to the method of the British Merchant Shipping Act 1854. The result was that the shipowners had to pay more, and, objections being raised, the whole question of the method of charge was submitted to an international conference which met at Constantinople in 1873 It fixed the dues at 10 francs per net register ton (English reckoning) with a surtax of 4 francs per ton, which, however, was to be reduced to 3 francs in the case of ships having on board papers showing their net tonnage calculated in the required manner. It also decided that the surtax should be gradually diminished as the traffic increased, until in the year after the net tonnage passing through the canal reached 2,600,000 tons it should be abolished. De Lesseps protested against this arrangement, but on the sultan threatening to enforce it, if necessary by armed intervention, he gave in and brought the new tariff into operation in April 1874 By an arrangement with the canal company, signed in 1876, the British Government, which in 1875 by the purchase of the khedive's shares, had become a large shareholder, undertook negotiations to secure that the successive reductions of the tariff should take effect on fixed dates, the sixth and last instalment of 50 centimes being removed in Jan 1884, after which the maximum rate was to be 10 francs per official net ton. But before this happened British shipowners had started a vigorous agitation against the rates, which they alleged to be excessive, and had even threatened to construct a second canal In consequence a meeting was arranged between them and representatives of the canal company in London in Nov. 1883, and it was agreed that in Jan. 1885 the dues should be reduced to 9½ francs a ton, that subsequently they should be lowered on a sliding scale as the dividend increased, and that after the dividend reached 25% all the surplus profits should be applied in reducing the rates until they were lowered to 5 francs a ton. Under this arrangement they were fixed at 7¾ francs per ton at the beginning of 1906. In 1928, as from April 1, the rates were reduced to 7 francs for loaded ships and 4 50 francs for ships in ballast, per Suez Canal net ton of 100 cubic feet For passengers the dues remain at 10 francs a head, the figure at which they were originally fixed.

By the concessions of 1854 and 1856 the dues were to be the same for all nations, preferential treatment of any kind being forbidden, and the canal and its ports were to be open "comme passages neutres" to every merchant ship without distinction of nationality The question of its formal neutralization by international agreement was raised in an acute form during the Egyptian crisis of 1881–82, and in August of the latter year a few weeks before the battle of Tel-el-Kebir, navigation upon it was suspended for four days at the instance of Sir Garnet Wolseley, who was in command of the British forces At the international conference which was then sitting at Constantinople various proposals were put forward to ensure the use of the canal to all nations, and ultimately at Constantinople on Oct 29, 1888, Great Britain, Germany, Austria, Spain, France, Italy, the Netherlands, Russia and Turkey signed the Suez Canal Convention, the purpose of which was to ensure that the canal should "always be free and open, in time of war as in time of peace, to every vessel of commerce or of war, without distinction of flag" Great Britain, however, in signing, formulated a reservation that the provisions of the convention should only apply so far as they were compatible with the actual situation, namely the "present transitory and exceptional condition of Egypt," and so far as they would not fetter the liberty of action of the British government during its occupation of that country But by the Anglo-French agreement of April 8, 1904, Great Britain declared her adherence to the stipulations of the convention, and agreed to their being put in force, except as regards a provision by which the agents in Egypt of the signatory Powers of the convention were to meet once a year to take note of the due execution of the treaty. (X.)

THE SUEZ CANAL, SHOWING LOOK-OUT STATIONS ALONG ITS COURSE

The World War.—In 1909, the Company approached the Egyptian Government with a request for the prolongation of their concession (due to expire in 1968). The Egyptian parliament unanimously rejected the offer. The World War in 1914 changed this situation. The defence and direction of the canal—its enormous plant and its expert personnel—were handed over to the British military authorities. The canal became the strategical frontier of Egypt, guarded by the armies and navies of France and

of the British Empire. Its waterway was open to the ships of Allied and neutral powers for the whole of those four eventful years, except during a few hours of fighting on Feb. 3, 1915, when a Turkish army that had marched across the desert from Damascus to invade Egypt was routed—never to return. From end to end the banks of the canal resembled one long armed camp, of which all traces had in 1925 disappeared; and the only signs visible to future generations of that great upheaval will be the three war monuments at Port Said, Ismailia and Suez, and the railway which Lord Allenby laid from Kantara to Jerusalem for the subjugation of Palestine.

Development.—Since the war, the engineering programmes, which had been seriously interrupted, have been taken in hand with redoubled vigour. These programmes include the building of jetties and of "bassins," and the widening, deepening and straightening of the canal, a process which will be continued until the two largest ships that use Eastern and Far Eastern ports can cross one another in the canal without tying up.

Another great improvement is the creation of a new city opposite to Port Said, to which the name of Port Fuad has been given. To this new centre of activity all the company's engineering and repair shops were transferred, an operation which greatly reduced the congestion in Port Said. On this, the Asiatic side of the canal, all the employees and work-people now resident in Port Said will eventually live; and in this hope the company drew up a far-reaching scheme for a kind of garden city with avenues and boulevards, shops and schools, hospitals, churches and mosques, and with dwelling houses and apartments suitable for all classes of a very international community. This city was inaugurated by H.M. King Fuad in person in Dec. 1926.

Control and Finance.—Although the British Government holds seven-sixteenths of the shares, the company is, as a matter of fact, predominantly French for purposes of administration. On the board of management there are one Dutch, ten British and 21 French directors, and they work in closest harmony. Of the ten British directors, three represent the British Government in respect of their large holding of shares, and seven represent the shipping and commercial interests of Great Britain, which now supplies about 57% of the total traffic through the canal. Next in order of importance comes the Dutch mercantile marine, with 10% of the total; and third on the list we find Germany (whose flag was not seen on the canal between 1915 and 1920) providing 9·6%, France 6% and so on. The capital sum (£4,000,000) invested by Great Britain in Suez Canal shares in 1875 has been repaid about eight times in dividends and interest. In 1926 His Majesty's Government received £950,000 and in 1927 £1,550,000, free from all taxation at the source. The French Government owns no shares in this pre-eminently French enterprise, but it benefits to no small degree by the prosperity of the company, whose business was taxed in 1926 to the extent of about 77,000,000 francs. The value of a share (250 francs) was 18,000 francs in March 1928. (*See* PALESTINE, OPERATIONS IN.)

SUFFOLK, EARLS AND DUKES OF. These English titles were borne in turn by the families of Ufford, Pole, Brandon, Grey and Howard. Robert, son of a Suffolk landowner, John de Peyton, acquired the lordship of Ufford in that county and was known as Robert de Ufford. He held an important place in the Government of Ireland under Edward I. and died in 1298; his son Robert (1279–1316) was created Baron Ufford in 1309. Robert's eldest surviving son, another Robert (*c.* 1298–1369), was created earl of Suffolk in 1337, and was present at the battles of Creçy and Poitiers. On the death, without heirs, of his son William, the 2nd earl, who took part in the suppression of the Peasants' Revolt in 1381, the earldom became extinct, his extensive estates reverting to the Crown.

In 1385 the earldom of Suffolk and the lands of the Uffords were granted by Richard II. to his friend Michael Pole (*c.* 1330–1389), a son of Sir William atte Pole. (*See* POLE FAMILY.)

In 1514 the title of duke of Suffolk was granted by Henry VIII. to Charles Brandon (*see* SUFFOLK, CHARLES BRANDON, 1ST DUKE OF) and it became extinct on the death of his second son Charles in July 1551. In the same year it was revived in favour of Henry Grey, marquess of Dorset, who had married Frances, a daughter of the first Brandon duke. Grey, who became marquess of Dorset in 1530, was a prominent member of the reforming party during the reign of Edward VI. He took part in the attempt to make his daughter, Jane, queen of England in 1553, but as he quickly made his peace with Mary he was not seriously punished. In 1554, however, he took part in the rising headed by Sir Thomas Wyat; he was captured, tried for treason and beheaded in February 1554, when the dukedom again became extinct. In 1603 Thomas Howard, Lord Howard de Walden, son of Thomas Howard, 4th duke of Norfolk, was created earl of Suffolk, and the earldom has been held by his descendants to the present day. (*See* SUFFOLK, THOMAS HOWARD, 1st earl of.)

SUFFOLK, CHARLES BRANDON, 1ST DUKE OF (*c.* 1484–1545), was the son of William Brandon, standard-bearer of Henry VII., who was slain by Richard III. in person on Bosworth Field. He was high in Henry VIII.'s favour, and held a succession of offices in the royal household. On May 15, 1513 he was created Viscount Lisle, having entered into a marriage contract with his ward, Elizabeth Grey, Viscountess Lisle in her own right, who, however, refused to marry him when she came of age. He distinguished himself at the sieges of Terouenne and Tournai in the French campaign of 1513. At this time Henry VIII. was secretly urging Margaret of Savoy, regent of the Netherlands, to marry Brandon, whom he created duke of Suffolk. Brandon took part in the jousts which celebrated the marriage of Mary Tudor, Henry's sister, with Louis XII. of France, on whose death he was sent to congratulate the new king Francis I. An affection between Suffolk and the dowager queen Mary had subsisted before her marriage, and Francis charged him with an intention to marry her. Henry was anxious to obtain from Francis the gold plate and jewels which had been given or promised to the queen by Louis and he practically made his acquiescence in Suffolk's suit dependent on his obtaining them. The pair cut short the difficulties by a private marriage. Suffolk was only saved from Henry's anger by Wolsey, and the pair eventually agreed to pay to Henry £24,000 in yearly instalments of £1,000, and the whole of Mary's dowry from Louis of £200,000, together with her plate and jewels. They were openly married at Greenwich on May 13. The duke had been twice married already, to Margaret Mortimer and to Anne Browne. Anne Browne died in 1511, but Margaret Mortimer, from whom he had obtained a divorce on the ground of consanguinity, was still living. He secured in 1528 a bull from Pope Clement II. assuring the legitimacy of his marriage with Mary Tudor, and of the daughters of Anne Browne. Suffolk was present at the Field of the Cloth of Gold in 1520, and in 1523 he was sent to command the English troops at Calais. He laid waste the north of France. Suffolk was in favour of Henry's divorce from Catherine of Aragon, and after Wolsey's disgrace his influence increased daily. He was sent with the duke of Norfolk to demand the great seal from Wolsey; the same noblemen conveyed the news of Anne Boleyn's marriage to Queen Catherine, and Suffolk acted as high steward at the new queen's coronation. He was commissioned by Henry to dismiss Catherine's household. He received a large share of the plunder after the suppression of the monasteries. In 1544 he was for the second time in command of an English army for the invasion of France. He died at Guildford on Aug. 24, 1545.

There is abundant material for the history of Suffolk's career in the *Letters and Papers of Henry VIII.* (ed. Brewer in the Rolls Series). *See* also Dugdale, *Baronage of England* (vol. ii. 1676); and G. E. C., *Complete Peerage*. An account of his matrimonial adventures is in the appendix to a novel by E. S. Holt, *The Harvest of Yesterday*.

SUFFOLK, CHARLES HOWARD, 9TH EARL OF (1675–1733), who succeeded to the title in June 1731, married Henrietta, a daughter of Sir Henry Hobart, bart., of Blickling, Norfolk. Both husband and wife were in the household of the prince of Wales, who, as George II., acknowledged Mrs. Howard as his mistress. She was formally separated from her husband before

1731 when she became countess of Suffolk. The earl died on Sept. 28, 1733, but the countess, having retired from court and married the Hon. George Berkeley (d. 1746), lived until July 26, 1767. Among Lady Suffolk's friends were the poets Pope and Gay and Charles Mordaunt (earl of Peterborough)

A collection of *Letters to and from Henrietta Countess of Suffolk, and her Second Husband, the Hon. George Berkeley,* was edited by J. W. Croker (1824). *See* also L. Melville, *Lady Suffolk and her Circle* (1924).

SUFFOLK, THOMAS HOWARD, 1st Earl of (1561-1626), second son of Thomas Howard, 4th duke of Norfolk, was born on Aug. 24, 1561. He behaved very gallantly during the attack on the Spanish armada and afterwards took part in other naval expeditions, becoming an admiral in 1599. Created Baron Howard de Walden in 1597 and earl of Suffolk in July 1603, he was lord chamberlain of the royal household from 1603 to 1614 and lord high treasurer from 1614 to 1618, when he was deprived of his office on a charge of misappropriating money. He was tried in the Star Chamber and was sentenced to pay a heavy fine. Suffolk's second wife was Catherine (d. 1633), widow of the Hon. Richard Rich, a woman whose avarice was partly responsible for her husband's downfall She shared his trial and was certainly guilty of taking bribes from Spain. One of his three daughters was the notorious Frances Howard, who, after obtaining a divorce from her first husband, Robert Devereux, earl of Essex, married Robert Carr, earl of Somerset, and instigated the poisoning of Sir Thomas Overbury (*q.v.*). The earl died on May 28, 1626

SUFFOLK, WILLIAM DE LA POLE, Duke of (1396-1450), second son of Michael de la Pole, second earl of Suffolk, was born on Oct 16, 1396. Suffolk served in all the later French campaigns of the reign of Henry V, and in spite of his youth held high command on the marches of Normandy in 1421-22 In 1423 he joined the earl of Salisbury in Champagne, and shared his victory at Crevant. He fought under John, duke of Bedford, at Verneuil on Aug. 17, 1424, and throughout the next four years was Salisbury's principal lieutenant in the direction of the war When Salisbury was killed before Orleans on Nov 3, 1428, Suffolk succeeded to the command After the siege was raised, Suffolk was defeated and taken prisoner by Jeanne d'Arc at Jargeau on June 12, 1429 He was soon ransomed, and during the next two years was again in command on the Norman frontier. He returned to England in November 1431, after over fourteen years' continuous service in the field

Suffolk had already been employed on diplomatic missions by John of Bedford; anxious for peace, he attached himself to Cardinal Beaufort. The question of Henry VI.'s marriage brought him to the front. Humphrey of Gloucester favoured an Armagnac alliance Suffolk brought about the match with Margaret of Anjou. When he returned to England in June 1444, after negotiating the marriage and a two years' truce, he received a triumphant reception He was made a marquess, and in the autumn sent again to France to bring Margaret home. The French extorted from him a promise to surrender all the English possessions in Anjou and Maine, a fatal concession. Humphrey of Gloucester died in February 1447, within a few days of his arrest, and six weeks later Cardinal Beaufort died also. Rumour, though without sufficient reason, made him responsible for Humphrey's death, while the peace and its consequent concessions rendered him unpopular So also did the supersession of Richard of York by Edmund Beaufort, duke of Somerset, in the French command Suffolk's promotion to a dukedom in July 1448, marked the height of his power The difficulties of his position may have led him to give some countenance to a treacherous attack on Fougères during the time of truce (March 1449) The renewal of the war and the loss of all Normandy were its direct consequences. When parliament met in Nov. 1449, the opposition showed its strength by forcing the treasurer, Adam Molyneux, to resign. Molyneux was murdered by the sailors at Portsmouth on Jan. 9, 1450. Suffolk boldly challenged his enemies in parliament, appealing to the long and honourable record of his public services The Commons now presented articles of accusation dealing chiefly with alleged maladministration and the ill success of the French policy, there was a charge of aiming at the throne by the betrothal of his son to the little Margaret Beaufort. Suffolk denied the accusations as false, untrue and too horrible to speak more of. Ultimately the king sentenced him to banishment for five years. Suffolk left England on May 1. He was intercepted in the Channel by the ship "Nicholas of the Tower," and next morning was beheaded in a little boat alongside.

Popular opinion at the time judged Suffolk as a traitor. This view was accepted by Yorkist chroniclers and Tudor historians, who had no reason to speak well of a Pole Later legend made him the paramour of Margaret of Anjou, which the story appears in the *Mirrour for Magistrates,* and Shakespeare's *2 Henry VI.* (Act. III sc. ii). Suffolk's best defence is contained in the touching letter of farewell to his son (*Paston Letters,* i. 142), and in his noble speeches before parliament (*Rolls of Parliament,* v. 176, 182) The policy of peace which he pursued was just and wise, he foresaw its risk to himself.

Suffolk's wife, Alice, was widow of Thomas, earl of Salisbury, and granddaughter of Geoffrey Chaucer. By her he had an only son John, second duke of Suffolk

Bibliography.—Suffolk is necessarily prominent in all contemporary authorities The most important are J. Stevenson's *Wars of the English in France,* Thomas Beckington's *Correspondence,* T. Wright's *Political Poems and Songs,* ii. 222-234 (for the popular view)—these three are in the Rolls Series, and the *Paston Letters* Of French writers E. de Monstrelet and Jehan de Waurin are most useful for his military career, T Basin and Matthieu d'Escouchy for his fall (all these are published by the Société de l'Histoire de France). For modern accounts *see* especially W Stubbs, *Constitutional History* (favourable), *The Political History of England* (1906), vol. iv., by C Oman (unfavourable), and G du Fresne de Beaucourt's *Histoire de Charles VII See* also H A. Napier's *Historical Notices of Swincombe and Ewelme* (1858)

SUFFOLK, an eastern county of England Area 1,488·6 sq. miles Much of the county is formed by low hills, rising occasionally over 400 ft They are a continuation of the Chilterns and they form the main watershed of the county They consist of chalk, covered to the east by boulder clay, with glacial sand interspersed with patches of London clay, Pliocene deposits and alluvium. Alluvium also appears in the fens in the north-west Subsidence has let the sea far into the land along the rivers.

Palaeolithic implements have been found in fair abundance in some of the gravels in the north-west of the county, less abundantly from there southward to the Stour and only sporadically in other parts of the county. In Neolithic times the middle of the county with its boulder clays was probably for the most part forested, and this accounts for the fact that most of the artefacts of this age have been found on the higher chalk lands of the west and on the lighter soils near the coast especially in the north and south extremities of the county In other parts they are found generally along the river-valleys that are floored with gravel. A marked feature of pre-historic Suffolk is the number of beaker-pots of the late Neolithic or early Metal age which have been found there. These have been found particularly around the estuaries of the Stour, Orwell and Deben, where presumably, the immigrants landed first. It is thought that they then pushed up the rivers into the north-western part of the county and here a number of other beakers have been discovered Bronze implements have been found in much the same places as the Neolithic, except that they are scarce in the north-east. In the centuries immediately preceding the Christian era Suffolk was invaded by Brythonic tribes, and traces of their handiwork have been found here. Along with Norfolk it formed part of the kingdom of the Iceni, and it was ravaged by the Romans after the unsuccessful revolt of Boudicca (Boadicea). The Roman road from Colchester to Venta Icenorum crossed the county from near Stratford St. Mary to Scole Just north of the Gipping this road threw out a branch in the direction of Dunwich, whence it led north-west again to cross the Waveney near Bungay. To the west there ran from north to south from Norfolk the continuation of the Peddar's way. The ancient track of the Icknield way ran along the chalk hills of the north-west. On the Suffolk coast the Romans built two forts to guard the Saxon shore—the first has left traces

at Burgh castle, the other, which was at Walton near Felixstowe, has been washed away by the sea.

The county of Suffolk (Sudfole, Suthfolc) was formed from the south part of the kingdom of East Anglia which had been settled by the Angles in the latter half of the 5th century. The most important Anglo-Saxon settlements appear to have been made at Sudbury and Ipswich. It suffered severely from the Danish incursions and after the treaty of Wedmore formed part of Danelaw. The whole shire lay within the diocese of Dunwich, which was founded *c.* 631. In 673 a new bishopric was established at Elmham to comprise the whole of Norfolk which had formerly been included in the see of Dunwich. The latter came to an end with the incursion of the Danes, and on the revival of Christianity in this district Suffolk was included in the diocese of Ely. The county has now become part of the new diocese of St. Edmundsbury and Ipswich. There were a number of religious houses in the county, and the most important remains are those of the great Benedictine abbey of Bury St. Edmunds; the college of Clare, originally a cell to the abbey of Bec in Normandy and afterwards to St. Peter's Westminster, converted into a college of secular canons in the reign of Henry VI., still retaining much of its ancient architecture, and now used as a boarding-school; the Decorated gateway of the Augustinian priory of Butley; and the remains of the Grey Friars monastery at Dunwich. A peculiarity of the church architecture is the use of flint for purposes of ornamentation. Another characteristic is the round towers, the principal examples being those of Little Saxham and Herringfleet, both Norman. The Decorated is well represented, but by far the greater proportion of the churches are Perpendicular. The church of Blythburgh in the east and the ornate building at Lavenham in the west may be noted as typical, while the church of Long Melford, another fine example, should be mentioned on account of its remarkable lady chapel. Special features are the open roofs and woodwork (as at St. Mary's, Bury St. Edmunds, Earl Stonham and Stonham Aspall, Ufford and Blythburgh), and the fine fonts.

The Normans built castles in the county at Eye and Walton, and there are remains of the entrenchments and part of the walls of Bungay, the ancient stronghold of the Bigods; the ruins of Mettingham, built in the reign of Edward III.; Wingfield, surrounded by a deep moat, with the turret walls and the drawbridge still existing; the ruin of Framlingham, with high and massive walls, originally founded in the 6th century, but restored in the 12th; the outlines of the fortress of Clare castle, anciently the baronial residence of the earls of Clare; and the Norman keep of Orford castle. Probably the establishment of Suffolk as a separate shire was scarcely completed before the Conquest, and although it was reckoned as distinct from Norfolk in the Domesday survey of 1086, the fiscal administration of Norfolk and Suffolk remained under one sheriff until 1575. The shire court was held at Ipswich. In 1086 Babergh was rated as two hundreds, Cosford, Ipswich and Parham as half hundreds, and Samford as a hundred and a half. Hoxne hundred was formerly known as Bishop's hundred and the vills which were included later in Thredling hundred were within Claydon hundred. More than half the county was included in the ecclesiastical liberties of St. Edmund and St. Aethelreda of Ely, and in these the king's writs did not run.

In 1173 the earl of Leicester landed at Walton with an army of Flemings and was joined by Hugh Bigod against Henry II. Since 1290 the county was constantly represented in Parliament by two knights. In 1317 and the succeeding years a great part of the county was in arms for Thomas of Lancaster. Queen Isabella and Mortimer having landed at Walton found all the district in their favour. In 1330 the county was raised to suppress the supporters of the earl of Kent; and again in 1381 there was a serious rising of the peasantry chiefly in the neighbourhood of Bury St. Edmunds. Although the county was for the most part Yorkist it took little part in the Wars of the Roses. In 1525 the artisans of the south strongly resisted Henry VIII.'s forced loan. It was from Suffolk that Mary drew the army which supported her claim to the throne. In the Civil Wars the county was for the most part parliamentarian, and joined the Association of the Eastern Counties. Within the county there are several interesting examples of domestic architecture of the reigns of Henry VIII. and Elizabeth. Hengrave hall (*c.* 1530), 4 m. N.W. from Bury St. Edmunds, is a building of brick and stone, enclosing a court-yard. Another is Helmingham hall, a Tudor mansion of brick, surrounded by a moat crossed by a drawbridge. West Stow manor is also Tudor with a fine gatehouse.

The Reform bill of 1832 gave four members to Suffolk, at the same time disfranchising the boroughs of Dunwich, Orford and Aldeburgh. For parliamentary purposes the county now constitutes five divisions, each returning one member, viz., Lowestoft division, Eye, Bury St. Edmunds, Sudbury and Woodbridge. Ipswich returns one member, and part of the borough of Great Yarmouth falls within the county.

Suffolk was early among the most populous of English counties. Fishing fleets had left its ports to bring back cod and ling from Iceland and herring and mackerel from the North sea, while it carried on a trade with Flanders. From the 14th to the 17th century it was among the chief manufacturing counties of England owing to its cloth-weaving industry, which was at the height of its prosperity during the 15th century. In the 17th and 18th centuries its agricultural resources were utilized to provide the rapidly-growing metropolis with food. In the following century various textile industries, such as the manufacture of sail-cloth, coconut fibre, horse-hair and clothing were established; silk-weavers migrated to Suffolk from Spitalfields, and early in the 19th century an important china factory flourished at Lowestoft.

In the 18th century Suffolk was famed for its dairy products, but the high price of grain during the wars of the French Revolution led to the breaking up of the pastures and it is now one of the principal grain-growing counties in England. In 1926 the acreage of land under crops and grass was 742,693; 552,383 of which were arable. Barley is the chief grain crop with 126,-179 ac., wheat next, 97,866 ac., and then oats with about half as much acreage as wheat. Mangolds, turnips, and swedes occupied 47,271 acres and sugar beet 35,000 acres. Beans and peas covered nearly 50,000 acres. The acreage of clover and rotation grasses for hay was 55,589. Suffolk punch horses are famous and the native breed of cows is of the polled variety. Milk is sent to London and other towns, while a large number of cattle are also fattened in the county. Sheep, usually a cross between the old Norfolk horned and the Southdown are reared on the drier soils, while large numbers of pigs are also bred.

The most important manufactures relate to agriculture. They include that of agricultural implements, especially at Ipswich, Bury St. Edmunds and Stowmarket, and that of artificial manures at Ipswich and Stowmarket, for which coprolites are dug. Malting is extensive, with small manufactures, including silk, cotton, linen, woollen and horsehair and coconut matting.

The L.N.E. railway serves the county. Suffolk comprises 21 hundreds, and, since 1888, for administrative purposes is divided into the counties of East Suffolk (557,353 ac.), population (1921) 291,073, and West Suffolk (390,916 ac.), population, 108,985.

The following are the municipal boroughs:

(1) East Suffolk. Aldeburgh, Beccles, Eye, Ipswich, a county borough and the county town, Lowestoft, Southwold.

(2) West Suffolk. Bury St. Edmunds, Sudbury.

There is one court of quarter sessions for the two administrative counties, which is usually held at Ipswich for East Suffolk, and then by adjournment at Bury St. Edmunds for West Suffolk. The boroughs of Bury St. Edmunds, Ipswich and Sudbury have separate courts of quarter sessions.

Page, *Supplement to the Suffolk Traveller* (1843); *Victoria County History: Suffolk;* Christopher Marlowe, *People and Places in Marshland* (1927).

SUFFOLK, a city of south-eastern Virginia. Pop. 9,123 in 1920 (40% negroes); estimated locally (including suburbs) at 17,500 in 1928. Suffolk peanut sales amount to $25,000,000 annually. There are seven peanut factories, several oyster-packing

plants, and other industries. Suffolk was founded and incorporated in 1742, and chartered as a city in 1910. Since 1919 it has had a city-manager form of government. St. Luke's church near by (built in 1632) is one of the oldest churches in the United States.

SUFFRAGAN (1) a diocesan bishop in his relation to the metropolitan; (2) an assistant bishop. (*See* BISHOP)

SUFFRAGE, the right or the exercise of the right of voting in political affairs; in ecclesiastical use, the short intercessory prayers in litanies spoken or sung by the people as distinguished from those of the priest or minister. (*See* ELECTORAL SYSTEMS; ELECTORS; REPRESENTATION; VOTE AND VOTING; REGISTRATION: and, for the Women's Suffrage Movement, WOMEN'S SUFFRAGE.)

SUFFREN SAINT-TROPEZ, PIERRE ANDRÉ DE (1729–1788), French admiral, was born in the Château de Saint Canat (Aix) on July 17, 1729 He entered the Order of Malta and also the close and aristocratic corps of French naval officers as a cadet in October 1743, in the "Solide," one of the line of battleships which took part in the confused engagement off Toulon in 1744 He was next in the "Pauline" in the squadron of M. Macnémara on a cruise in the West Indies. In 1746 he went through the duc D'Anville's disastrous expedition to retake Cape Breton, which was ruined by shipwreck and plague. Next year (1747) he was taken prisoner by Hawke in the action with the French convoy in the Bay of Biscay When peace was made in 1748 he went to Malta to perform the cruises with the galleys of the Order of Malta technically called "caravans," a reminiscence of the days when the knights protected the pilgrims going from Saint Jean d'Acre to Jerusalem. In Suffren's time this service rarely went beyond a peaceful tour among the Greek islands. Suffren was present at the taking of Minorca, but in 1757 he was again a prisoner of the English After the peace, on the French ship "Caméléon," he chased the Barbary pirates, and from 1767 to 1771 he returned to his "caravan," becoming a commander of his Order.

In the years 1778 and 1779 he served with the squadron of D'Estaing (*q v*) on the coast of North America and in the West Indies. He led the line in the action with Admiral John Byron off Grenada, and his ship, the "Fantasque" (64), lost 62 men. His letters to his admiral show that he strongly disapproved of D'Estaing's half-hearted methods. In 1780 he was captain of the "Zèle" (74), in the combined French and Spanish fleets which captured a great English convoy in the Atlantic His candour towards his chief had done him no harm in the opinion of D'Estaing It is said to have been largely by the advice of this admiral that Suffren was chosen to command a squadron of five ships of the line sent out to help the Dutch who had joined France and Spain to defend the Cape against an expected English attack, and then to go on to the East Indies

He sailed from Brest on March 22 on the cruise which has made him unique among French admirals, and he was by experience as well as by temperament impatient with the formal manoeuvring of his colleagues, which aimed at preserving their own ships rather than at taking the English On April 16, 1781, he found the English expedition on its way to the Cape under the command of George Johnstone (1730–1787), at anchor in Porto Praya, Cape de Verde Islands Remembering how little respect Boscawen had shown for the neutrality of Portugal at Lagos, he attacked at once. He pushed on to the Cape, which he saved from capture by Johnstone, and then made his way to the Île de France (Mauritius), then held by the French. D'Orves, his superior officer, died as the united squadrons, now eleven sail of the line, were on their way to the Bay of Bengal. The campaign, which Suffren now conducted against the English admiral Sir Edward Hughes (1720?–1794), included many severe encounters. Four actions took place in 1782: south of Madras (Feb. 17), near Trincomalee (April 12), off Cuddalore (July 6), and at Trincomalee (Sept 3) The English lost no ships in these actions; neither did they take any Suffren attacked with unprecedented vigour on every occasion, but was ill-supported by some of his captains. He maintained his squadron without a port to refit, and anchored at Trincomalee. His activity encouraged Hyder Ali, who was then at war with the Company. He refused to return to the islands to escort the troops coming out under command of Bussy, maintaining that his proper purpose was to cripple the squadron of Sir Edward Hughes.

During the north-east monsoon he would not go to the islands but refitted in the Malay ports in Sumatra, and returned with the south-west monsoon in 1783 Hyder Ali was dead, but Tippoo Sultan, his son, was still at war with the Company. Bussy arrived and landed. The operations on shore were slackly conducted by him, and Suffren was much hampered, but when he fought his last battle against Hughes (April 20, 1783), with fourteen ships to eighteen he forced the English admiral to retire to Madras, leaving the army then besieging Cuddalore in a very dangerous position. The arrival of the news that peace had been made in Europe put a stop to hostilities, and Suffren returned to France. While refitting at the Cape on his way home, several of the vessels also returning put in, and the captains waited on him. Suffren said in one of his letters that their praise gave him more pleasure than any other compliment paid him.

In France he was received with enthusiasm, and an additional office of vice-admiral of France was created for him. He had been promoted bailli in the Order of Malta during his absence He died on Dec 8, 1788, when he was about to take command of a fleet collected in Brest. Long afterwards it was stated that he was killed in a duel with the prince de Mirepoix in consequence of a refusal to restore to their naval rank two of his relatives who had been dismissed from the service

The standard authority for the life of Suffren is the *Histoire du Bailli de Suffren* by Ch. Cunat (1852). The *Journal de Bord du Bailli de Suffren dans l'Inde,* edited by M. Mores, was published in 1888. There is an appreciative study in Captain Mahan's *The Influence of Sea Power upon History, 1660–1783* (1890).

ṢŪFĪISM (*taṣawwuf*) is formed from the Arabic word *Ṣūfī,* which was applied, in the 2nd century of Islam, to men or women who adopted an ascetic or quietistic way of life. The word *Ṣūfī* from *ṣūf* (wool) refers to garments worn by such persons.

Mysticism in Islam goes back to Mohammed who, notwithstanding his condemnation of Christian monkery, was led by the example of the hermits and of the Ḥanīfs, to preach the efficacy of ascetic exercises, such as prayer, vigils and fasting. Again, while Allah is described in the *Qur'ān* as the one God working his arbitrary will in unapproachable supremacy, other passages lay stress on his all-pervading presence and intimate relation to his creatures, *e g*, "Wherever ye turn, there is the face of Allah" (ii. 109), "We (God) are nearer to him (man) than his neck-vein" (l. 15). The germs of mysticism latent in Islam from the first rapidly developed in the two centuries following the prophet's death in consequence of Messianic hopes and presages, the luxury of the upper classes and the hard mechanical piety of the orthodox creed The terrors of hell, so vividly depicted in the *Qur'ān* awakened in many an intense consciousness of sin, which drove them to seek salvation in ascetic practices. Ṣūfīism was originally a practical religion, not a speculative system, and the early *Ṣūfīs* were closely attached to the Muslim doctrine, but they took up and emphasized certain *Qur'ānic* terms, such as *dhikr* (praise of God) consisting of recitation of the *Qur'ān,* repetition of the Divine names, etc, and *tawakkul* (trust in God), now defined as renunciation of all personal initiative and volition, leaving one's self entirely in God's hands. Quietism soon passed into mysticism. Towards the end of the 2nd century the doctrine of mystical love was set forth in the sayings of a female ascetic, Rābi'a of Basra. Henceforward the use of symbolical expressions, borrowed from the vocabulary of love and wine, becomes increasingly frequent as a means of indicating holy mysteries which must not be divulged. This was not an unnecessary precaution, for in the course of the 3rd century, there sprang up a speculative and pantheistic movement which was essentially anti-Islamic. A little later Abū Sulaymān al-Dārānī in Syria and Dhu'l-Nūn in Egypt developed the doctrine of gnosis (*ma'rifat*) through illumination and ecstasy. The step to pantheism was first decisively taken by the Persian Abū Yazīd (Bāyezīd) of Bistām (d. A D 874), who introduced the doctrine of annihilation (*fanā*), *i e.* the passing away of individual consciousness in the will of God.

ITS EVOLUTION

In the evolution of Ṣūfīism, influences outside of Islam made themselves powerfully felt. Christian influence had its source, not in the Church, but in the hermits and unorthodox sects, to whose ideal of unworldliness Ṣūfīism owed much. More than one Ṣūfī doctrine—that of *tawakkul* in particular—show traces of Christian teaching. The monastic strain which insinuated itself into Ṣūfīism in spite of Mohammed's prohibition was derived, partially at any rate, from Christianity. But Buddhistic influence may also have been at work. Buddhism flourished in Balkh, Transoxiana and Turkestan before the Mohammedan conquest, and in later times Buddhist monks carried their religious practices and philosophy among the Muslims who had settled in these countries. The use of rosaries, the doctrine of *fanā*, which is probably a form of Nirvāna, and the system of "stations" (*maqāmāt*) on the road thereto, would seem to be Buddhistic in their origin. The third great foreign influence on Ṣūfīism is the Neoplatonic philosophy. Between A.D. 800 and 860 the tide of Greek learning, then at its height, streamed into Islam. The so-called "Theology of Aristotle," which was translated into Arabic about A.D. 840, is full of Neoplatonic theories, and the mystical writings of the pseudo-Dionysius were widely known throughout western Asia. It is not mere coincidence that the doctrine of Gnosis was first worked out in detail by the Egyptian Ṣūfī, Dhu'l-Nun (d. A.D. 859), for Ṣūfīism on its theosophical side was largely a product of Alexandrian speculation.

By the end of the 3rd century Ṣūfī mysticism was fast becoming an organized system, with rules of discipline and devotion which the novice was bound to learn from his spiritual director, to whose guidance he submitted himself absolutely, as to one regarded as being in intimate communion with God. At the head of these directors stood a mysterious personage called the *Quṭb* (Axis); on the hierarchy of saints over which he presided the whole order of the universe was believed to depend. During the next two hundred years (A.D. 900–1100), various manuals of theory and practice were compiled: the *Kitāb al Luma'* by Abū Naṣr al-Sarrāj, the *Qūt al-Qulūb* by Abū Ṭālib'al-Makkī, the *Risāla* of Qushayrī, the Persian *Kashf al-Maḥjūb* by 'Alī ibn 'Uthmān al-Hujwīrī, and the famous *Iḥyā* by Ghazālī. They all expatiate on the discipline of the soul and describe the process of purgation which it must undergo before entering on the contemplative life. The traveller journeying towards God passes through a series of ascending "stations"; in the oldest extant treatise these are: (1) repentance, (2) abstinence, (3) renunciation, (4) poverty, (5) patience, (6) trust in God, (7) acquiescence in the will of God. After the "stations" comes a parallel scale of "states" of spiritual feeling (*aḥwāl*), such as fear, hope, love, etc., leading up to contemplation (*mushāhadat*) and intuition (*yaqīn*). It only remained to provide Ṣūfīism with a metaphysical basis, and to reconcile it with orthodox Islam. The double task was finally accomplished by Ghazālī (*q.v.*). He made Islamic theology mystical, and since his time the revelation (*kashf*) of the mystic has taken its place beside tradition (*naql*) and reason (*'aql*) as a source and fundamental principle of the faith.

MANY SHADES OF OPINION

The Ṣūfīs comprise many shades of opinion—from asceticism and quietism to pantheism. The pantheistic type which prevails in Persia throws the transcendental and visionary aspects of Ṣūfīism into undue relief, as in the sayings attributed to Bāyazīd (d. A.D. 874), *e.g.*, "I am the winedrinker and the wine and the cup-bearer"; "I went from God to God, until they cried from me in me, 'O Thou I.'" The peculiar imagery which distinguishes the poetry of the Persian Ṣūfīs was developed by Abū Sa'īd ibn Abi'l-Khayr (d. A.D. 1049) in his quatrains which express the relation between God and the soul by glowing and fantastic allegories of earthly love, beauty and intoxication. Henceforward, the great poets of Persia, with few exceptions, adopt this symbolic language. The whole doctrine of Persian Ṣūfīism is expounded in the celebrated *Mathnawī* of Jalāluddīn Rūmī (*q.v.*) but in a discursive and unscientific manner; its leading principles may be stated briefly as follows:—

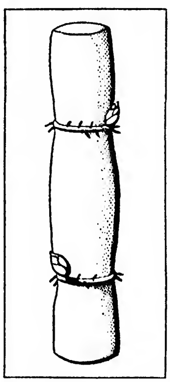
God is the sole reality (al-Ḥaqq) and is above all names and definitions. He is not only absolute Being, but also absolute Good, and therefore absolute Beauty. It is the nature of beauty to desire manifestation; the phenomenal universe is the result of this desire, according to the famous Tradition in which God says, "I was a hidden treasure, and I desired to be known, so I created the creatures in order that I might be known." As things can be known only through their opposites, Being can only be known through Not-being, wherein as in a mirror Being is reflected; and this reflection is the phenomenal universe, which accordingly has no more reality than a shadow cast by the sun.

The Ṣūfī theosophy as it appears in Persian and Turkish poetry tends to abolish the distinction between good and evil—the latter is nothing but an aspect of not-being and has no real existence—and it leads to the deification of the hierophant who can say, like Ḥusain b. Manṣur al-Ḥallāj, "I am the Truth." Ṣūfī fraternities, living in a convent under the direction of a shaykh, became widely spread before A.D. 1100 and gave rise to Dervish orders, most of which indulge in the practice of exciting ecstasy by music, dancing, drugs and various kinds of hypnotic suggestion (*see* DERVISH).

BIBLIOGRAPHY.—The foremost authority is Professor R. A. Nicholson, whose writings [*Selected poems from the Dīvāni Shamsi Tabrīz*, translated with an introduction, etc. (Cambridge, 1898); *Enquiry concerning the origin and development of Ṣūfīism* (J.R.A.S., 1906, 303 *sqq.*); *Translation of the Kashf al-Mahjūb, the oldest Persian treatise on Ṣūfīism* (London, 1911); *Studies in Islamic Mysticism* (Cambridge, 1921); *The Idea of Personality in Ṣūfīism* (Cambridge, 1923); together with his more popular treatise *The Mystics of Islam* (London, 1914)] have caused most previous works to have merely an antiquarian interest. He also published the text and translation of *The Mathnawí of Jalálu'ddin Rúmí* (Books I. and II., London, 1925, 1926). An excellent introduction to the study of Islamic mysticism is given in E. J. W. Gibb's *History of Ottoman Poetry*, 1, 33 *sqq.* (London, 1900). Professor L. Massignon's *La Passion d'al-Ḥallaj, martyr mystique de l'Islam*, followed by *Essai sur les origines du lexique technique de la mystique musulmane* (Paris, 1922), is a mine of erudition. Some account of Ṣūfīism is also given by D. B. Macdonald, *The religious attitude and life in Islam* (Chicago, 1909), and I. Goldziher, *Vorlesungen über den Islam* (Heidelberg, 1925).

SUGAR. This name applies to over 100 substances, having distinctive properties and scientific names; for example, sucrose, glucose, fructose, lactose, maltose.

Of the numerous sugars which occur in plants, sucrose (*q.v.*) is the most abundant and has been extracted commercially from sugar cane, sugar beet, maple tree, Indian maize, sorghum grass, and several species of palm. As it occurs in solution in the sap or juice, man's task is to extract the juice, and to convert the dissolved sucrose into the marketable crystals we call *sugar*. Therefore, cane sugar, beet sugar, maple sugar, etc., consist essentially of sucrose, admixed with small percentages of impurities derived from the plant-juices. These impurities account for differences in colour, odour, and flavour of raw cane and beet sugars. When refined these sugars are colourless and odourless, have equal sweetening power, contain about 99·8% of sucrose, and cannot be distinguished by chemical analysis. After further purification in the laboratory, they both contain 100% of sucrose.



FROM HERIOT, "MANUFACTURE OF SUGAR" (LONGMANS GREEN & CO.)

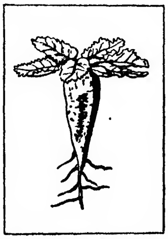
FIG. 1.—SUGAR CANE STEM

The Sugar Cane.—This plant is a gigantic grass, sometimes attaining, under favourable conditions of growth, a height of 20 ft. (*See* Plate, fig. 1.) The average length of stalk is about 12 ft. The plant belongs to the natural order *Gramineae*, genus *Saccharum*, and is a perennial. It requires a moist and warm climate. Some varieties can only thrive in the tropics, others can be grown successfully in sub-tropical countries. The time required to reach maturity varies with climate and averages 13 months. The stems of different varieties vary in diameter from

one half to nearly three inches, and are divided transversely by nodes (fig. 1).

The stem has a hard, very thin skin or rind, varying in colour from pale yellow or green to deep purple and sometimes striped with two colours. The interior of the stem is solid, consisting of colourless fibrous tissue in which the juice is stored. The leaves are from 3 to 4 ft. in length and from 2 to 3 in. in width, a single leaf springing from each node, and on alternate sides of the stem. Although the plant usually bears flowers and seed, it has always been propagated from cuttings of the stem, the attached "eyes" or buds (fig. 1) then forming a cluster or *stool* of canes.

When harvested, the canes are cut at the ground-level, the leafy upper joints (*tops*) cut off and reserved for planting material, and the long stems transported to the sugar factory. They contain from 11 to 16% of sucrose, with a general average of 13%. The root-stock, left in the ground, remains alive and sends up new stems in successive years. On reaching maturity, most varieties produce an immense number of flowers, of microscopic size, forming a feathery plume called the *arrow*. This is borne on a stalk which grows erect from the top of the stem, to a height of 2 or 3 ft.



FROM HERIOT, "MANUFACTURE OF SUGAR" (LONGMANS GREEN & CO.)
FIG. 2.—SUGAR BEET

Since 1890, great efforts have been made to produce improved varieties of cane, following the example set in the beet sugar industry. For this purpose, the cane was raised from seed, and hybrid varieties obtained with greater resistance to disease.

The Sugar Beet.—This plant belongs to the natural order *Chenopodiaceae*, genus *Beta*, and belongs to the same family as the red garden beet and mangel-wurzel. The modern sugar beet (fig. 2) was evolved from a white beet (*Beta Alba*) formerly grown as a forage crop in Silesia. By systematic seed-selection, extending over many years, the sucrose content was gradually increased from about 5% in the Silesian root, to 20%, or even more. At the same time, the tap-root was much reduced in size, and the purity of the sap increased by a reduction in the saline impurities. The plant is a biennial, developing root and foliage and storing up sucrose during the first year's growth. During the second year, it sends up tall, branched shoots which flower and bear seed, after which the plant dies

The tap-root consists of colourless parenchyma tissue, in which the juice is stored, and alternate layers of fibrous tissue. The external skin is usually white, but, in some varieties, pink. Fine root-threads extend from the sides and apex of the tap-root, to supply the plant with water and mineral plant-foods. The large leaves spring from the top, or crown of the tap-root, and spread laterally just above the ground. The flowers are very small, greenish in colour, and finally develop into the fruit or seed-ball. This is commonly called the *seed*, but contains from one to seven embryos (true seeds), and is used for propagating the plant.

All modern varieties are derived from two standard types of "improved" sugar beet, namely, *Vilmorin's Blanche Ameliorée* produced in France, and *Klein Wanzleben* produced in Germany. Although some varieties may contain over 20% of sucrose, the average sucrose-content is 16%, as compared with 13% for the sugar cane.

The Cane and Beet Compared.—The record production for beet was 2·19 tons of commercial sugar per acre in Germany in 1910–11, and for cane 5·5 tons per acre in Java in 1925–26; or about 2½ times that for beet. The corresponding crops were 12 tons of washed beets and 42 tons of canes per acre.

For the Chemistry of the Sugars, *see* articles: CARBOHYDRATES; SUCROSE; GLUCOSE; and FRUCTOSE.

MANUFACTURING AND REFINING

Formerly, white sugar could be produced only by the combined operations of the "raw sugar factory" and the "refinery." Raw sugars, made from cane and beet juices, contain about 96% of sucrose. Refined white sugars, made by further treatment of raw sugars, contain about 99·8% of sucrose. With progress in sugar technology, it became possible to produce white sugars, of high purity, from cane and beet juices by a direct process (not used in the refinery). They are termed "direct consumption sugars."

Extraction from the Cane.—From the earliest times, the juice has been extracted by crushing the canes between rollers, and a simple form of mill consists of three horizontal rollers, one being placed above the other two (*see* one of the four mills shown in section in fig. 3). Slow rotary motion of the top-roller is transmitted to each of the two lower rollers (front and back rollers) by toothed gearing, causing the three rollers to rotate at the same speed of 2 to 2½ rev. per min. The canes are crushed between the top and front rollers, and again, between the top and back rollers; while the extracted juice flows down the surfaces of the two lower rollers and falls into a receiver below, whence it flows to a strainer and pump.

The modern cane-mill, fig. 3, is a combination of three or more of these mills, with mechanical transporters for carrying the crushed cane (*megass* or *bagasse*) from one mill to the next, and from the last mill to the furnaces, where it is used as fuel. In order to prepare a uniform and compact *feed* entering the first mill, the canes are first reduced to small pieces by passing through one or more machines, called *knives, crushers* and *shredders*. In fig. 3, the first mill is preceded by a crusher, consisting of two rollers having interlocking teeth which cut the canes into short lengths, squeezing them and extracting much juice.

The heavy pressure applied by the mill-rollers is produced by hydraulic power acting on the sliding bearings of each top-roller, forcing these rollers vertically downwards upon the *feed* passing over the lower rollers. One top-roller may thus apply a pressure of over 500 tons.

The extraction is greatly increased by spraying water upon the bagasse as it passes from one mill to the next, thus diluting the unextracted juice in the bagasse, and facilitating its extraction in the following mill. In fig. 3, water is sprayed upon the bagasse behind the third mill; the very dilute juice extracted by the fourth is pumped to a spraying-pipe behind the second (*see* pipe-line and arrow); and the dilute juice extracted by the third mill is pumped to a spraying-pipe behind the first The juice extracted by the crusher and first two mills flows to a tank from which it is pumped to another part of the factory. By this system of spraying with water and dilute juice, the mill shown in fig. 3 will extract from 95 to 96% of the total sucrose in the canes. The addition of a shredder between the crusher and the first mill will increase the extraction to 97 or even 98%, according to the quantity of saturation water applied between the mills. A more powerful milling plant consists of two sets of knives, followed by a crusher, a shredder and five mills, and extracting about 99% of the sucrose in the canes.

The bagasse, leaving the last mill, contains about 45% water, 50% fibre, and 2 to 4% unextracted sucrose. Under normal conditions, no other fuel is required for steam production

The extracted juice is a dark, opaque liquid, having an acid reaction. It contains from 12 to 16% of dissolved sucrose, and small percentages of glucose, fructose, organic acids, colouring matters, nitrogen compounds, pectin, gum and mineral matters. It also holds in suspension finely divided fibre, wax, clay and air-bubbles; the last slowly rising to the surface, forming a thick white foam.

Chemical Treatment of the Juice.—As the dissolved non-sugars are colloidal (*see* COLLOIDS), the juice must undergo some form of chemical treatment before it can be filtered satisfactorily. The natural acidity of the juice must also be neutralized, because sucrose decomposes on heating acid juices, the sucrose combining with water and breaking up into two simpler sugars, glucose and fructose, as shown in the equation:—

$$C_{12}H_{22}O_{11}+H_2O=C_6H_{12}O_6+C_6H_{12}O_6.$$

This is termed *inversion* of sucrose, and the resulting mixture of glucose and fructose is termed *invert sugar*.

The object of chemical treatment is fourfold:—(1) To neutralize the natural acidity (as just explained); (2) to remove suspended impurities, thus rendering the juice transparent; (3)

STEPS IN SUGAR MANUFACTURE

1. Field of sugar cane. The large bundle of stalks in the foreground is piled across strong ropes. It will be hoisted on carts and transported to the factory
2. First step in harvesting field of sugar beets. Ploughs drawn by mules cut tap-root where it is small and loosen surrounding earth so that beets may be pulled easily by hand
3. Machinery used in the final operations of sugar making. While moist, sugar is carried to revolving sugar drier (top) fitted with narrow shelves. Sugar is carried repeatedly upward on shelves while current of hot air is drawn through drum for drying. Sugar next drops into revolving sifter (centre) where it is sorted into three sizes or grades. It then gravitates to automatic weighing machines (bottom) from which bags are suspended
4. Cutting sugar slabs into cubes with modern machinery
5. Vacuum pan (top) where colourless first liquor is boiled and crystallized. Different pans are required for different grades of sugar. The product discharged from the vacuum pan goes into the Massecuite Receiver (bottom) where it undergoes further treatment

FIG. 3.—MULTIPLE CANE-MILL

to precipitate dissolved non-sugars, thus increasing the purity of the juice; and (4) to decolourize the juice in the manufacture of white sugar.

The chemical agents used are:—quicklime (CaO), usually added in the form of lime-cream (CaH_2O_2); sulphur dioxide gas (SO_2); carbon dioxide gas (CO_2); and, occasionally, phosphoric acid (H_3PO_4). The effect of these chemical agents is completed by heating the juice to boiling point in an apparatus called a *juice-heater*, the juice flowing continuously through a number of brass tubes heated externally by steam. Certain impurities, previously dissolved in the juice, are thus rendered insoluble and form a dark coloured precipitate which can be separated in various ways: (*a*) by causing it to rise to the surface (with the escaping air-bubbles), forming a *scum* which is removed by skimming ladles; (*b*) by allowing it to subside (after separation of the air) and removing it as a *sediment;* (*c*) by filtration through cloth or other filtering media; (*d*) by centrifugal action.

In the manufacture of *raw sugar,* about two gals. of lime-cream (15° Beaumé) are added per 1,000 gals. of juice; the mixture is heated to boiling point and discharged into settling tanks (*subsiders* or *clarifiers*), each holding 1,000 gal. or more, and filled in rotation. After subsidence for about an hour, the clear juice is drawn off into one gutter, and the sediments into another. The sediments are usually resubsided in additional tanks, more clear juice being then drawn off. The final sediments are pumped through filter-presses (*see* article FILTRATION), yielding clear filtered juice and cakes of solid matter. The clear juices flowing from the first subsiders, resubsiders and filter-presses, are mixed and pass to the multiple-effect evaporator (to be described later).

In the manufacture of *white sugar,* a more thorough purification of the juice is essential, and two methods are used, (a) *acid sulphitation* and (b) *carbonation.* As the latter method is mainly used for treating beet juice it will be described under that heading. In the former, *a*, from 4 to 5 gal. of lime-cream are added per 1,000 gal. of juice, and sufficient sulphur dioxide gas to precipitate this lime, with the formation of a granular precipitate of calcium sulphite ($CaSO_3$), as shown in the equation

$$CaO+SO_2=CaSO_3.$$

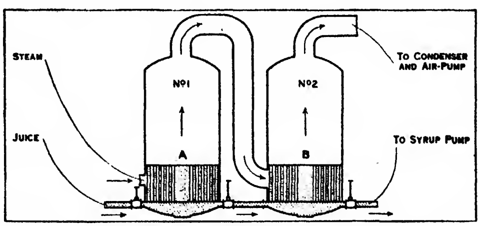
The gas may be added either before or after liming, the final result being the same. The juice is then heated and subsided.

Evaporation of Water.—A large quantity of water must be evaporated from the purified juice before the dissolved sucrose can begin to crystallize. To avoid destruction of sucrose at high temperatures the juice is boiled in closed vessels under a vacuum, thus lowering the boiling point. Further, in order to economize fuel, *multiple effect evaporators* are used.

Fig. 4 is a sectional view of a *double-effect* evaporator. The lower part of each vessel contains numerous vertical brass tubes, their open ends passing through perforations in two horizontal plates. The space between these plates forms a steam-drum, with steam-inlet. The shaded space below the drum and inside the tubes is filled with the boiling juice. The large space above the drum is filled with steam generated by the boiling juice. Steam entering the drum of No. 1 condenses on the exterior of the tubes, transmitting its latent heat to the juice inside the tubes and causing it to boil. The steam thus generated passes into the steam-drum of No. 2 and there acts in the same manner. The steam generated here by the boiling juice passes to a condenser and air-pump, which maintain a vacuum of about 25 inches in No. 2. This vacuum fixes the boiling point of the juice here, also the temperature at which steam (leaving No. 1) can condense on the tubes in No. 2, also the pressure of that steam and the boiling point of the juice in No. 1. Consequently, the high vacuum and low boiling point in No. 2 produce a lower vacuum and higher boiling point in No. 1. Multiple effect evaporation is applicable to any number of connected vessels.

In fig. 4 the level of the boiling juice in No. 2 is maintained constant at B by drawing in juice from No. 1; similarly, the level in No. 1 is maintained constant at A by drawing in juice from an external supply-tank. At the same time, concentrated juice, or syrup, is drawn off continuously from No. 2 by a pump, and at such a rate that the density of the syrup in No. 2, and of that drawn off, remains constant at about 30° Beaumé. This syrup contains from 55 to 60% of dissolved solids (including sucrose). It is, therefore, an unsaturated solution, free from crystals.

Crystallization of the Syrup.—The final stage of evaporation, accompanied by the crystallization of the syrup, is carried out in the Vacuum Pan. This apparatus is shown in the Plate, fig. 5 (centre). Part of the interior, with steam-heated tubes, is shown on the left. Above, and to the right, is the condenser (shown in section) wherein the vapour generated by the boiling syrup is condensed by sprays of water. A vacuum of about 26″ is maintained inside the pan by the combined action of the condenser and air-pump (to right of pan); thereby lowering the boiling point of the syrup to about 130° F. Cane and beet sugar factories are equipped with three or four pans, each discharging from 10 to 20 tons of crystals after each boiling operation is completed.



FROM HERIOT, "MANUFACTURE OF SUGAR" (LONGMANS GREEN & CO.)

FIG. 4.—DOUBLE-EFFECT EVAPORATOR (VERTICAL SECTION)

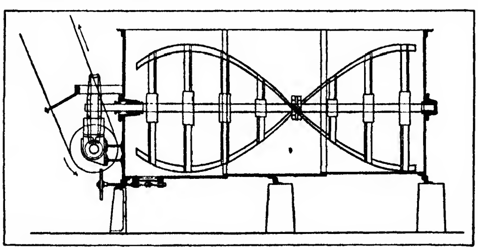
Sufficient syrup is first drawn into the pan to occupy only a part of its total capacity, and steam is admitted to the coils which are covered by the syrup. After a period of rapid boiling, the syrup becomes supersaturated and microscopic crystals begin to form. This is called the *graining point,* and it is important to

produce a sufficient quantity of *grain* as rapidly as possible, in order that the crystals may be of nearly uniform size during all stages of growth Having formed the grain, the operator reduces the supersaturation by drawing in small charges of unsaturated syrup from the supply-tank, at suitable intervals, thus preventing further formation of grain but causing the previously formed grain to grow until the pan is filled in from 3 to 4 hours. To make a large-grained final product, the operator starts with a smaller volume of syrup, yielding a proportionally smaller quantity of grain, thereby increasing the rate of growth of each grain. Conversely, to make a small-grained final product, he starts with a larger volume of syrup, yielding a larger quantity of grain, thereby reducing the rate of growth of each grain.

The time available for growth can be extended by transferring half the contents of a full pan to a second, empty pan, the two halves being then boiled simultaneously with further additions of syrup to each, causing continued growth of the original grain until both pans are filled During the process of boiling, the operator is guided by the appearance of small samples of the crystallized syrup which he removes from the pan at short intervals by means of a *proofstick*. The samples are spread upon a sheet of glass and examined by transmitted light from a lamp When the pan is full, the mixture of crystals and mother-liquor (called *massecuite*) is finally concentrated until it contains from 9 to 11% of water It is then semi-fluid and contains about 65% by weight of crystals and 35% of mother-liquor. Air is now admitted to the pan, the bottom gate opened, and the massecuite discharged.

Separation of Crystals from Mother-liquor.—This operation, called *curing the sugar,* is effected by centrifugal action in a number of machines operating simultaneously. Each consists of a vertical metal drum, or "basket," which can be rotated on a central vertical spindle at a speed of 800 to 1,200 revs per min The cylindrical wall of the drum is made of perforated steel plate and fitted with a lining of woven copper-gauze After the drum is set in motion, a charge of massecuite enters through a central opening at the top, and the centrifugal action forces the massecuite against the wire-gauze liner which acts as a strainer, allowing the fluid mother-liquor to pass through but retaining the crystals The separation is complete in about 2 mins. The plate shows the positions of the vacuum pan, massecuite-receiver, centrifugals and band-conveyor

In the manufacture of *raw sugar,* the above treatment yields sugar containing from 95 to 98% of sucrose and about 1% of water The colour, moisture and odour of this sugar are due to residual mother-liquor adhering to the crystals and which cannot be completely separated by centrifugal action alone. The band-



BY COURTESY OF THE MIRLESS WATSON CO

FIG 5.—CRYSTALLISER (VERTICAL SECTION)

conveyor (Plate, fig. 5) carries the sugar from the centrifugals to a storage-bin from which the sugar gravitates through chutes into bags placed upon weighing machines.

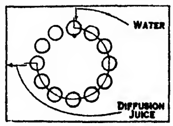
In the manufacture of *white sugar,* the separation of the mother-liquor is carried much further by spraying water over the layer of sugar in the centrifugal drum whilst this is rotating at full speed Indeed, two sets of centrifugals may be employed. To conceal any yellowish tint in the sugar, this is sprayed with ultramarine and water (called *blueing the sugar*) before the machine is stopped. After passing through a rotary *drier* (described later) the dry white sugar contains from 99·5 to 99·9% of sucrose.

The mother-liquor separated in the centrifugals contains a high percentage of sucrose It is reboiled in the vacuum pan where it crystallizes, forming *second grade massecuite.* This is treated in centrifugals where it separates into *second grade crystals* and *second grade mother-liquor.* The last is reboiled in the vacuum pan to form *third grade massecuite* which is discharged into large cylindrical *crystallizers,* each fitted with a slowly rotating central shaft carrying stirrers (fig. 3). The mother-liquor, from which no more sucrose can crystallize, is called *molasses* It is a highly concentrated solution containing sucrose and various organic and inorganic impurities derived from the original cane juice.

By-products.—These include: (*a*) the crushed cane (*bagasse* or *megass*) which is used as fuel, (*b*) filter-press cakes, which are used as fertilizer, (*c*) molasses, which is used for the production of alcohol, or as fertilizer, cattle-food, or fuel

THE MANUFACTURE OF SUGAR FROM THE BEET

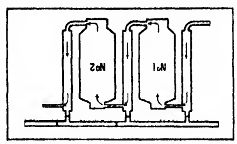
The *diffusion process* extracts sucrose from the beet juice (*see* DIALYSIS) The roots are reduced to thin shreds (*slices* or *cossettes*) and the slices immersed in warm water in vertical cylindrical vessels (*diffusers*). These have a capacity of from 500 to 2,500 gals each, according to the size of the factory, from 10 to 14 diffusers forming one battery Fig 6 represents a plan of a circular battery of 12 diffusers, and fig. 7 shows a vertical section of two of the diffusers, with connecting pipes Each has a small door at top for charging with fresh slices, and a large discharge-door at bottom for removing the spent slices Liquids pass from the bottom of any one diffuser to the top of the next (*see* arrows in fig 7), the slices remaining stationary in each As all the water used for diffusion must afterwards be evaporated before the contained sucrose can crystallize, this water is passed through many diffusers, extracting sucrose from the slices in each, until it attains a sufficiently high density and sucrose-content to be drawn off, being then called *diffusion juice*



FROM HERIOT, "MANUFACTURE OF SUGAR" (LONGMANS GREEN & CO)

FIG 6 —PLAN OF A CIRCULAR DIFFUSION BATTERY

In fig 6 diffuser No 1 has been longest in action, so that the extraction is nearly complete It is less complete in No 2, still less in No. 3, and so on up to No 10 where extraction is just beginning, this diffuser having just been filled with fresh slices and also with liquid entering it from No 9. Water is entering No 1 (*see* arrow in fig 6) in order to complete the extraction, and this water displaces an equal volume of liquid (already in No 1) into No 2, that already in No 2 into No 3, and so on up to No 10, where it displaces an equal volume of diffusion juice (*see* arrows and dotted line in fig 4) A part of this displaced juice flows through a pipe leading to a measuring tank, and the remainder passes forward into No 11 (just filled with slices), causing diffusion to begin in No 11. The extraction in No. 1 is now complete, and the spent slices are discharged Water is now forced into No. 2, causing displacements of liquids from No 2 into No. 3, from No. 3 into No. 4, and so on up to No. 11, where it displaces an equal volume of diffusion juice Part of this juice passes to the measuring tank and the remainder goes forward into No 12 (just filled with slices), causing diffusion to begin here. The extraction in No 2 is now complete, and the spent slices are discharged. Water is now forced into No 3 (continuing as before) The same series of operations is repeated round and round the battery. Fresh water is added to each diffuser in turn at one part of the battery; diffusion juice is drawn off from each diffuser in turn at another part; spent slices are discharged from each diffuser in turn; and fresh slices enter each diffuser in turn. A diffusion battery may sometimes be arranged in two parallel lines



FROM HERIOT, "MANUFACTURE OF SUGAR" (LONGMANS GREEN & CO)

FIG. 7 —TWO DIFFUSERS (VERTICAL SECTION)

instead of in a circle. The tops of the diffusers project just above the floor, and the battery is operated from this position. The motions of the liquids are controlled by three valves attached to the top of each diffuser.

The efficiency of extraction is proportional to the number of diffusers in action at one time and to the volume of water added to the battery per 100 kilo. of fresh slices. An extraction of 99% of the sucrose in the roots is easily obtained. Several forms of apparatus for continuous diffusion have been patented, the most successful being the *Raabe System.* It is a long, cylindrical vessel, divided transversely into numerous compartments, through which the slices and diffusion liquids move in opposite directions.

Chemical Treatment of the Juice.—The method used is called *Double Carbonation,* and its essential feature is the formation of an abundant precipitate of calcium carbonate ($CaCO_3$) in the juice, after the addition of quicklime (CaO) and carbon dioxide gas (CO_2). These chemical agents are produced simultaneously in a lime-kiln attached to the factory. A mixture of limestone ($CaCO_3$) and coke is added at the top of the kiln and gravitates very slowly to the bottom. The combustion of the coke produces a temperature of 1,000° to 1,300° C and the limestone decomposes, as shown in the equation:—$CaCO_3 = CaO + CO_2$. The gases rising to the top of the kiln are drawn off by a pump and forced through a *gas-washer* and thence through pipes to the tanks containing the juice. The quicklime is removed from the bottom of the kiln in small quantities at suitable intervals.

The raw diffusion juice is pumped through heaters into *liming* tanks where from 2 to 3% of lime is added, either in the form of quicklime (CaO) or as lime-cream (CaH_2O_2). After thorough stirring, the mixture gravitates to tall, rectangular, closed tanks (*carbonation tanks*), fitted with a gas-distributor at bottom for injecting the carbon dioxide gas, juice inlet and outlet cocks, a steam-coil for regulating the temperature of the juice, and a chimney at top for carrying off any unabsorbed gas. As the gas bubbles through the strongly alkaline juice, a gelatinous precipitate is first formed, this gradually decomposing with the formation of a granular precipitate of calcium carbonate, the final result being represented by the equation:—$CaO + CO_2 = CaCO_3$. This treatment (*first carbonation*) is continued until the alkalinity of the juice is reduced to about 0·1% of lime, when the opaque juice is pumped through filter-presses (*see* FILTRATION). The clear, filtered juice is still alkaline and passes to another set of *carbonation tanks* for a second treatment with the gas (*second carbonation*). This is continued until the alkalinity is reduced to 0·03 or 0·06% lime, causing a further precipitation of calcium carbonate, which is removed by a second filtration, yielding a transparent, light-coloured juice which, in some factories, is treated with sulphur dioxide gas (SO_2), followed by filtration, in order to bleach it.

The subsequent operations—evaporation of water, crystallization of the syrup, and separation of crystals from the mother-liquor—have been described above under "cane sugar."

By-products.—These include: (*a*) beet-pulp, used as fodder, either in the moist state or after drying; (*b*) filter-press cakes, which are sometimes used as fertilizer but more usually discarded; (*c*) molasses, which is used in the production of alcohol and cattle-fodder; (*d*) waster waters of no commercial value.

REFINING OF RAW CANE AND BEET SUGARS

This consists of three main operations: (1) dissolving the raw sugar in water; (2) decolourizing the resulting solution; and (3) re-crystallization.

Dissolving (or "Melting") the Raw Sugar.—This usually includes two operations. First, washing the raw sugar crystals to remove adhering molasses. Second, dissolving the washed raw sugar in hot water and filtering the resulting liquor to remove insoluble impurities. The raw sugar is mixed with syrup to form a magma which is fed into centrifugal machines (described above). These separate the magma into two parts:—(*a*) *washed raw sugar crystals* and (*b*) *affination syrup* or *wash-syrup.* The crystals are sprayed with water in the centrifugal to remove adhering wash-syrup, after which the machine is stopped and the washed raw sugar discharged. From 100 tons of *raw sugar* (96% sucrose) about 90 tons of *washed crystals* (99% sucrose) are obtained by the separation of 10 tons of dissolved sugar and impurities in the *wash-syrup.* This is called the *affination* process.

The washed raw sugar then passes to large cylindrical vessels (*melting tanks*) each holding from 5 to 10 tons of sugar and sufficient hot water to give a liquor containing about 60% by weight of sugar when all has dissolved. The melting tanks are fitted with mechanical stirrers and perforated steam-coils for heating. The resulting solution is termed *washed raw sugar liquor.* It is dark brown in colour and contains numerous insoluble impurities in suspension. To remove these, it is filtered through cloth in *leaf-filters, filter-presses* or *bag-filters* (*see* article FILTRATION). The filtered liquor is transparent but strongly coloured.

Decolourizing the Liquor.—This is effected by the action of bone-char (*q.v.*) in *char-filters,* large vessels measuring from 20 to 50 ft. in height, and from 5 to 10 ft. in diameter. The dark-coloured liquor enters at the top, and percolates through the char in from 3 to 6 hours, the rate of descent being regulated by the inlet-cock. In passing through the char, the liquor is completely decolourized and flows into a gutter leading to the *first liquor* tank.

After operating for several hours, the char begins to lose its power, and the treated liquor becomes slightly tinted, this being run into a second gutter leading to the *second liquor* tank. When the tint increases to a predetermined limit, the liquor-inlet cock is closed, and a cock admitting hot water is opened, this water displacing the tinted liquor remaining in the char, and gradually diluting it. When the outflowing tinted liquor begins to decrease in density it flows into two other receivers, one for *light liquor* until the density falls to 18° Beaumé, and another for *char water* until the density falls to 0·5° Beaumé. About 1 ton of water is required per ton of char, and the operation is called *sweetening off.* After further washing with hot water, which runs to waste, the char is dried and strongly heated in a *char-kiln,* thereby restoring its activity so that it can be used again. This cycle of operations is repeated several times a week for a few years; at the end of this time the char is of poor decolourizing power and is therefore discarded as "*spent char.*"

Crystallization.—The colourless *first liquor* is boiled and crystallized in the vacuum pan (Plate, fig. 5) in the same manner as cane syrup, but the size to which the crystals grow depends on the class of refined sugar to be made. A very large grain is required for *crystal* or *coffee sugar;* a medium grain for *granulated;* and a mixed small grain for *cube* (or *loaf*) and *caster* sugars. In each case, the product discharged from the vacuum pan is a mixture of crystals and mother-liquor (*massecuite*) which must undergo further treatment.

In the manufacture of *granulated, crystal* and coarse *caster* sugars, the massecuite from the vacuum pan is treated as in the manufacture of white granulated sugar direct from cane and beet juices. The final operations of drying, sifting and bagging are shown in Plate, fig. 3. The moist white sugar leaving the centrifugals is carried by the band-conveyor (Plate, fig. 5 [bottom]) to the raised extremity of the revolving sugar drier (Plate, fig. 3 [top]). The interior of the drier is fitted with narrow shelves (parallel to its axis) so that as the drum rotates, the sugar is repeatedly carried upwards on the shelves and then dropped, whilst a current of hot air is drawn through the drum by means of a fan (shown on the right). On reaching the lower extremity of the drum, the sugar becomes dry and contains about 99·9% of sucrose. It gravitates to the revolving sifter below, Plate, fig. 3, which is made in three sections, each section having wire-gauze of different mesh. The crystals are thus sorted into three sizes or grades:—*fine, medium* and *coarse* which fall into three cone-shaped hoppers below. Any lumps (accidentally produced) pass beyond the sieve and fall into a fourth hopper. The sifted sugar next gravitates from these hoppers to automatic weighing machines from which bags are suspended (Plate, fig. 3). The attendant opens a shutter which allows the sugar to flow into a bag, and, when the correct weight has entered, the machine automatically closes the shutter. The attendant then unfastens a strap holding the bag to the machine and the filled bag drops a few inches upon a band-conveyor which carries it to a sewing machine by which it is stitched up.

Cube sugar, sometimes called *loaf sugar,* is made by two alternative methods which can only be very briefly described here. *Method* (*a*). The production of rectangular slabs of white sugar, measuring about $20'' \times 10'' \times \frac{3}{4}''$, these being then cut up into single cubes by machinery. This method includes the Scheibler process (now little used) and the more modern Adant and Hubner processes. In the Adant process, the hot massecuite is run into a number of rectangular metal moulds, where it sets during partial cooling. The filled moulds are then transferred to a centrifugal machine of special construction, the mother-liquor separated by spinning, and the slabs of sugar washed with pure syrup entering at the centre of the machine The latter is then stopped, the moulds removed, and the slabs of white sugar dried and cut up into small cubes (*see* Plate, fig 4) The Hubner process is a modification of Adant's, and, whilst it economizes time and labour, gives a slightly reduced yield

Method (*b*). The sugar is moulded directly into cubes instead of into slabs. The massecuite discharged from the vacuum pan is spun in the ordinary type of centrifugal (Plate, fig. 5 [bottom]). The crystals are washed white and discharged into a *mixer* where they are thoroughly mixed with white sugar-liquor to form a magma. This flows into rows of small cubical pockets on the surface of a slowly rotating horizontal drum.

During every half-revolution of this drum, the magma is compressed inside each pocket forming single cubes, and rows of these cubes are ejected from the drum when the pockets reach their lowest positions. The empty pockets are refilled with magma on further rotation to their highest positions. The cubes fall from the drum upon a travelling band which carries them slowly through a drying chamber to the packing cases without any handling.

Icing sugar and the finest grade of *caster sugar* are made from some of the foregoing grades by grinding in mills.

By-products.—These include: (*a*) spent char, which is used as fertilizer; (*b*) molasses which may be fermented to yield alcohol or used in the manufacture of cattle-food, or purified to make edible syrup, or *treacle.*

PRODUCTION AND TRADE

Sugar is produced in Europe, Asia, Africa, America and Australia. In Europe and in parts of North America it is made from the sugar beet and in the other continents, from the sugar cane. When impurities have been removed by refining, no difference can be detected either by taste or smell, the chemical analysis of refined beet and cane sugar being identical

Output.—The quantities of cane and beet sugar produced in recent years have been, according to Willett and Gray·—

	1927–28	1926–27	1925–26	1913–14
	Tons	Tons	Tons	Tons
Cane	16,300,000	16,100,000	16,300,000	9,900,000
Beet	9,000,000	7,700,000	8,300,000	8,800,000
	25,300,000	23,800,000	24,600,000	18,700,000

The large increase in cane sugar is due to high prices during the World War The European beet sugar crops, on the other hand, were curtailed severely and in 1919–20 amounted to only 2,600,000 tons as compared with 8,000,000 tons made in 1913–14 —a decrease of 67½%. The chief producing countries are·—

	Tons	Year
Cuba	4,480,000 cane	1927–28
British India	3,600,000 ,,	1927–28
Java	2,950,000 ,,	1928–29
Germany	1,785,000 beet	1928–29
Russia	1,360,000 ,,	1927–28
Czechoslovakia	1,364,000 ,,	1927–28
United States	1,174,000 ,,	1927–28

Cuba is capable of producing more sugar, but prices of recent years have not been sufficiently remunerative to encourage increased production. During 1927 and 1928 an attempt was made by the Cuban Government to raise and stabilize the price of sugar by artificial crop restriction This experiment failed and the crop restriction policy has been dropped.

British Sugar.—About one-fifth of the total production of sugar is produced in British Dominions, as under —

	1927–28	1913–14
	Tons	Tons
British West Indies	253,000	120,000
Demerara	114,000	102,000
Australia	493,000	255,000
Fiji	95,000	100,000
Mauritius	215,000	250,000
Natal	221,000	86,000
Canada	27,000	10,000
United Kingdom	208,000	Nil
	1,626,000	923,000
British India	3,200,000	2,291,000
	4,826,000	3,214,000

British India consumes the whole of her crop, but the other parts of the Empire export nearly all the sugar they make, and this forms an increasing proportion of the raw material for the refineries of the United Kingdom and Canada.

The imports of empire-produced raw sugar into the United Kingdom have increased from 67,000 tons in 1913, to 333,000 tons in 1925 and to 556,000 tons in 1928 This increase has been largely brought about by Imperial Preference (*q v.*).

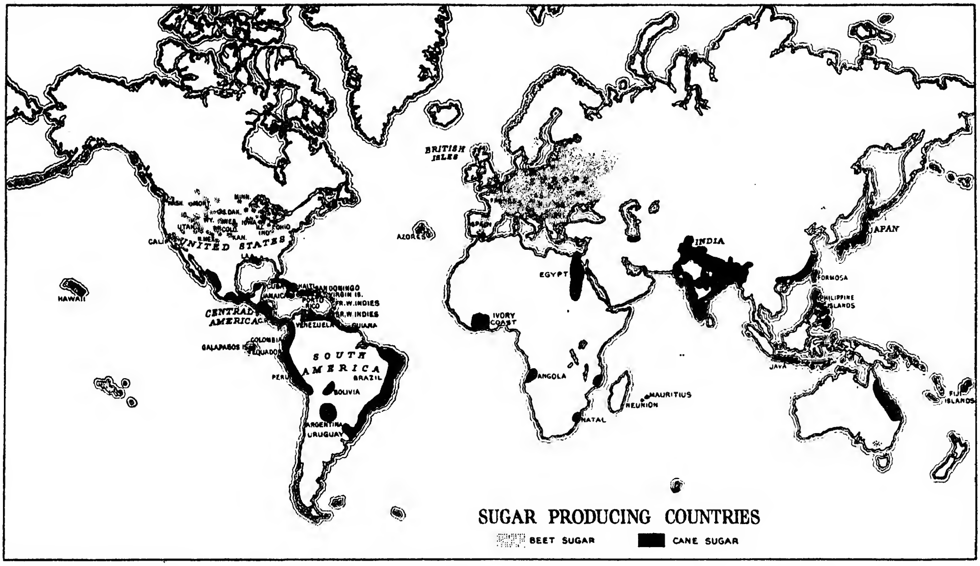
The quantity of sugar produced from an acre of land varies with conditions of weather, soil, labour and quality of cane. In parts of India, where primitive methods are still employed, less than one ton of sugar is made from one acre of cane On the other hand, the production in Java sometimes exceeds 5 tons to the acre, and in parts of the Hawaiian Islands as much as 12 tons per acre have been produced. The following figures show some approximate average yields.—

	tons per acre
Hawaii (cane)	5 ,,
Java (cane)	5 ,,
Cuba (cane)	2 ,,
India (cane)	1⅛ ,,
Philippines (cane)	⅞ ,,
Europe (beet)	1¼ to 2 ,,
United Kingdom (beet)	⅞ to 1¼ ,,

State Assistance.—This assistance may be either by way of a direct subsidy, as in England and the Irish Free State, or by means of a customs duty as in most of the European beet-growing countries Producers in such countries often form a "Cartel," by which is meant an agreement among themselves to raise the price of sugar to the consumer in their own country to a level just within the limit of the duty. Any sugar which they may make in excess of their home requirements is then exported at or below the world's price The producers may lose on the sugar exported, but the profits made on their sales at home are ample to recoup them for their loss.

In the United Kingdom, the beet sugar industry, stimulated by the subsidy and preference in Excise Duty provided under the British Sugar (Subsidy) Act of 1925, has expanded, and in the season 1927–28 the production of sugar was 225,000 tons. The total amount of assistance granted by the Government to the British beet sugar industry during the period commencing Oct. 1, 1924 and ending Sept. 30, 1928 was 26/10½d. per cwt. of sugar produced, made up as follows:—

	On each cwt. of sugar produced
Subsidy on sugar	19/6d.
Subsidy on molasses equivalent to	3/1½
The excise duty being lower than the duty on imported refined sugar by	4/3
	26/10½d.



BY COURTESY OF FARR & CO., N.Y.

MAP SHOWING THE SUGAR PRODUCING COUNTRIES OF THE WORLD

As from Oct. 1, 1928 the assistance was reduced to 19/4d. per cwt. and on Oct. 1, 1931 a further reduction to 11/9½d. per cwt. will take place. The primary object of the act was to aid agriculture, and the grant of the subsidy is contingent upon the factories paying certain minimum prices for their beets.

The United Kingdom and Canada aid sugar producers within the Empire by preferential tariffs. That is to say, sugar produced in the British Empire pays a lower import duty than other sugar when it enters the United Kingdom or Canada. In the United Kingdom this preference amounts to 3/9d. per cwt. on raw sugar and in Canada to about 1/- per cwt. more.

The United States in order to encourage the production of:—

(1) Beet sugar in the U.S.A.
(2) Cane sugar in Louisiana
(3) „ „ „ the Philippines }
(4) „ „ „ Porto Rico } all American Colonies
(5) „ „ „ Hawaii }

levies no duty upon the sugar produced by these countries, whereas an import duty of 11/- per cwt. is charged upon sugar imported from other localities. Cuban sugar is allowed to enter the United States on paying 20% less duty than other foreign sugar.

Prominent among the countries which receive no artificial stimulus is Java, where production has steadily increased, due partly to the fact that labour is cheap, and also to the highly organized state of the industry.

Sugar Consumption.—Before the war, the world's consumption of sugar increased with almost clock-like regularity. The average yearly increase over a period of 60 years was 3½% and in 1913 the quantity used was 19,000,000 tons. This expansion was arrested by the war, but consumption now shows definite signs of expansion, and in 1927 amounted approximately to 26,000,000 tons distributed roughly, as follows:—

	Tons
Europe	9,650,000
America	8,150,000
Asia	7,200,000
Africa	675,000
Oceania	450,000
	26,125,000

The United States, the United Kingdom, and British India together consume nearly one-half of this amount.

The countries which consume the largest quantity of sugar per head of the population are Australia, New Zealand, the United States and Denmark. In each about 1 cwt. per person is used, the tonnage being:—

	Tons
United States	5,500,000
Australia	325,000
New Zealand	70,000
Denmark	185,000

The next largest consumers are:—

	Per head in lb.
United Kingdom	95
Canada	92
Switzerland	85
Argentine	73
Holland	68
Sweden	66
Austria	65

In the Far East the question of prices is a more important factor than anywhere else in determining the consumption of sugar, and a rise in price in the western markets is invariably checked by the drifting thither of sugar not required by the Far East. In most countries it is consumed after it has been refined, a noticeable exception being India, where sugar is still largely consumed in a primitive form known as "Gur," practically the same as the old-fashioned sugar candy.

The United Kingdom consumes annually about 1,750,000 tons of sugar, and as she produces only a small crop herself, has to import large quantities. It is drawn from all parts of the world, and is imported partly in the refined form, but chiefly as raw sugar to be refined in London, Liverpool and the refineries of the Clyde.

The following are details of the imports of sugar into the United Kingdom, showing sources of refined and unrefined sugar for 1927 as compared with 1913:—

	1928	1913
Refined	Tons	Tons
Czechoslovakia	100,425	198,064
Holland	88,101	178,567
Germany	1,079	465,453
Others	7,651	79,276
Total all Europe	197,256	921,360
From places outside Europe	24,488	1,185
Total Refined	221,744	922,545
Unrefined		
Germany		472,026
Czechoslovakia	21,282	160,858
Total above and other places in Europe	44,555	682,730
Cuba	702,780	224,227
San Domingo	208,359	9,412
Peru	99,933	27,487
Mauritius	133,675	20,075
B W.I	150,604	47,736
Australia		
Total above and other places outside Europe	1,887,365	363,985
Total Raws	1,931,920	1,046,715
Total Raw and Refined	2,153,664	1,969,260

Sugar Taxes.—Sugar is taxed in most countries for the purposes of revenue, and in some a protective tax on imported sugar is levied In the United Kingdom the import duty is payable according to polarization, and during the present century, the amount charged upon sugar exceeding 98° polarization has varied as follows:—

	Year	Amount of duty per cwt.
April	1901	4/2d
May	1908	1/10
September	1915	9/4
April	1916	14/–
April	1918	25/8
April	1924	11/8

Raw sugar not exceeding 98° polarization produced in the British Empire pays a duty lower by 47/5d per cwt than non-European sugar of the same polarization, this preferential tariff has been stabilized for ten years ending in 1935, and the excise duty payable upon beet sugar produced in the United Kingdom under the British Sugar (Subsidy) Act, 1925, is the same as the import duty on sugar of empire origin The budget of 1928 reduced the import duty on raw sugar not exceeding 98° polarization by the equivalent of ½d. per lb on refined sugar

Import and Excise duties in other parts of the world are as follows, expressed in shillings per cwt —

	Import duty	Additional excise duty payable alike by home produced and imported sugar
Holland	Nil	23/9d.
Czechoslovakia	21/–	9/3
Poland	14/2	8/9
France	8/3	10/3
Germany	7/6	5/3
Sweden	5/7	4/6
Belgium	4/9	2/4
U S A	11/-	Nil
Canada	8/9	Nil

Sugar Prices.—Prior to 1914 the price of raw sugar fluctuated between 9/– and 11/6d per cwt, which was sufficiently remunerative to maintain the equilibrium between supply and demand. Occasional crop failures raised prices above that level, and the effect upon production was immediate

The highest price for raw sugar in recent years, was paid on May 19, 1920, when Cuban raw sugar was sold to New York at a price equal to 140/– per cwt. After violent fluctuations during 1921–24 there was a decline through overproduction, and at the end of May 1929 the price was 8/6 per cwt.

SUGAR IN COOKERY

As sugar is an important soluble carbohydrate and is easily assimilable, it is valuable in the diet. Candy contains a high proportion of sugar (or glucose), but no dish for the table should do so. In adding sugar to fruit, more is needed if it is cooked with the fruit than if added when the cooking is completed

Cane and Beet Sugars (Sucrose).—These are the principal sugars used in cookery. They dissolve in one-third their own bulk of cold water, and in a smaller amount of hot water Their melting point is 320° F If cooled at that point, they become barley sugar; if cooked beyond that point they become burnt sugar or caramel. Fine granulated or castor sugar is generally used in cookery. For icings, meringues and whips, powdered or pulverized (icing) sugar is used, the finest form being confectioners' sugar All powdered sugars must be rolled and sifted fine before using These sugars are all pure white refined products Brown and yellow sugars, which are produced by evaporation, are also used in cookery when there is no objection to a dark colour, and some of them have a delicious flavour They vary in both colour and flavour, the best known being Demerara or coffee sugar, and dark brown or Barbadoes sugar

Other Sugars.—Glucose is less sweet than sucrose, and the commercial form is cheaper. It is used in many manufactured candies, jams and syrups to economize, but is not much used in the home Commercial grape sugar is a dextrose Maple sugar (sucrose) is much prized for its special flavour, but is made in comparatively small quantity, as is also palm sugar Ame is a Japanese sweetening material that contains dextrin and maltose. Saccharin is not a sugar, and has no food value, but it is very sweet and is sometimes substituted for sugar, usually on a physician's orders.

Caramel or Burnt Sugar.—This is marketed ready prepared, for use as "browning" for sauces, gravies, stews and the like, and also as a flavouring in such dishes as caramel custard (custard with caramel below or around it). It can be prepared at home by melting granulated sugar in a saucepan over a low fire, with constant stirring. It may be used at once as it is, or after removing from the fire, boiling water (¼ cup water to 1 cup sugar) may be added very slowly, again with constant stirring Return this mixture to the fire and cook to a rich dark brown (8 to 10 minutes). This hardens on standing, but can be melted over hot water (*See* also Treacle, Honey.)

SUGAR BEET: *see* Beet.

SUGAR-BIRD, the English name of the West India birds of the genus *Certhiola* (belonging to the Passerine family *Coerebidae*) for their habit of frequenting the curing-houses where sugar is kept, attracted thither by the flies. In their figure and motions they resemble a nuthatch, while their coloration—black, yellow, olive, grey, and white—recalls a titmouse

SUGER (*c.* 1081–1151), French ecclesiastic, statesman and historian entered the abbey of St. Denis about 1091. Until about 1104 he was educated at the priory of St. Denis de l'Estrée, and there first met his pupil King Louis VI In 1118 he was sent by Louis VI. to the court of Pope Gelasius II. at Maguelonne, and lived from 1121 to 1122 at the court of his successor, Calixtus II. On his return Suger was appointed abbot of St. Denis, devoting himself to reforms. During the second crusade he was a regent of the kingdom.

Suger wrote a panegyric on Louis VI. (*Vita Ludovici regis*), and was part-author of the *Historia gloriosi regis Ludovici* (Louis

VII.). In his *Liber de rebus in administratione sua gestis*, and its supplement *Libellus de consecratione ecclesiae S. Dionysii*, he treats of the improvements he had made to St. Denis, describes the treasure of the church, and gives an account of the rebuilding. Suger's works served to imbue the monks of St. Denis with a taste for history, frequently resulting in quasi-official chronicles.

See O. Cartellieri, *Abt Suger von Saint-Denis* (Berlin, 1898); A. Luchaire, *Louis le Gros* (Paris, 1890); F. A. Gervaise, *Histoire de Suger* (Paris, 1721).

SUGGESTION. By the older writers on psychology the words "suggest" and "suggestion" were generally used in senses very close to those of common speech. Modern studies in mental pathology and hypnotism (*q.v.*) have led to the use of these words by psychologists in a special and technical sense. The hypnotists of the Nancy school rediscovered and gave general currency to the doctrine that the most essential feature of the hypnotic state is the unquestioning obedience and docility with which the hypnotized subject accepts, believes and acts in accordance with every command or proposition of the hypnotizer. These commands were called "suggestions"; and the subject that accepted them in this fashion was said to be "suggestible." It is made clear, chiefly by French physicians, that a high degree of "suggestibility" is a leading feature of hysteria.

It is also becoming widely recognized that the suggestibility of hypnosis and of hysteria is conditioned by a peculiar state of the brain, namely a cerebral or mental dissociation, which in hypnosis is temporarily induced by the operations of the hypnotist, and in hysteria arises from some deficiency of energy in the whole psycho-physical system. But as to the range of suggestion great differences of opinion still obtain. Firstly, it is maintained (notably by Professor Pierre Janet, whose studies of hysterical patients are celebrated) that suggestibility is a condition peculiar to hysterical subjects. In view of assertions of physicians that they find more than 90% of all subjects hypnotizable, it would seem that this stigmatization of suggestibility as in every case a morbid symptom, is erroneous. A second group consists of writers who admit that suggestion may operate in normal minds, but that it is a process of very exceptional nature. They hold that suggestion, whether it occurs in morbid or in healthy subjects, always implies the coming into operation of some obscurely conceived faculty or region of the mind which is present in all men, but which usually lies hidden beneath our more commonplace mental activities. This submerged faculty is variously called the secondary or submerged stratum of consciousness, the subconscious or subliminal self (*see* SUBLIMINAL SELF). These writers insist upon the more startling of the effects producible by suggestion, such as paralysis, contracture, hyperaesthesia, increased power of recollection, hallucinations (*q.v.*), etc.; and they regard dissociation as the process by which the supernormal faculty (or faculties) is liberated from the normal waking self.

A third view connects itself with, and bases itself upon, the view of Professor Bernheim and his colleagues of the Nancy school of hypnotism. According to this view all men are normally suggestible under favourable conditions, and the hypnotic subject and the hysteric patient differ from the normal human being chiefly in that their normal suggestibility is more or less (sometimes very greatly) increased, owing to the prevalence of the state of cerebral dissociation.

According to this third view, suggestion may be defined as the communication of any proposition from one person (or persons) to another in such a way as to secure its acceptance with conviction, in the absence of adequate logical grounds for its acceptance. The idea or belief so introduced to the mind of the recipient is held to operate powerfully upon his bodily and mental processes in proportion to the degree of its dominance over all other ideas or mental processes; and the extraordinary character of the effects, both bodily and mental, of suggestion in hypnotic and hysterical subjects is held to be due to the fact that, in these conditions of mental dissociation, the dominance of the suggested idea is complete and absolute; whereas in the absence of such dissociation the operation of the suggested idea is always subject to some weakening or inhibition through the influence of many opposed or incompatible tendencies and ideas, even if these do not rise into explicit consciousness.

This third view seems justified by the facts that no sharp line can be drawn between the suggestibility of normal men and that of hypnotized or hysterical subjects, and that under favourable conditions many of the most striking results of suggestion (*e.g.*, hallucinations, contractures, inability to move, insensibility of various sense-organs, and so forth) may be produced in subjects who present at the time no other symptom of the hypnotic or hysterical condition.

If, then, we recognize, as we must, that the alogical production of conviction is the essence of suggestion, and that this frequently occurs in normal minds as well as in those suffering from various degrees of dissociation, it becomes necessary to define the conditions which are resident, on the one hand, in the recipient of the suggestion, and, on the other hand, in the source from which the suggestion comes.

(*a*) Defect of knowledge. The usual well-trained mind is relatively insuggestible, firstly because it possesses large stores of knowledge and belief; secondly, because this mass of knowledge and belief is systematically organized in such a way that all its parts hang together and mutually support one another. On the other hand, the young child, the uncultured adult, and especially the savage, are apt to be suggestible in regard to very many topics, firstly, because they have relatively little knowledge; secondly, because what little they have is of a low degree of organization; *i.e.*, it does not form a logically coherent system whose parts reciprocally support one another. Suggestion in such cases may be said to be conditioned by primitive credulity or the suggestibility of ignorance. (*b*) But the same person will not be found to be equally suggestible at all times under similar external conditions. A man is least suggestible when his mind works most efficiently; every departure from this state, due to fatigue, bodily ill-health, emotional perturbation, drugs or any other cause, favours suggestibility. (*c*) Persons of equal degrees of knowledge or ignorance will be found, even at their times of greatest mental efficiency, to be unequally suggestible owing to differences of native disposition; one person is by nature more open than another to personal influence, more easily swayed by others, more ready to accept their dicta and adopt their opinions for his own. Differences of this kind are probably the expression of differences in the native strength of one of the fundamental instinctive dispositions of the human mind.

Considered from the side of the agent, suggestion is favoured by whatever tends to render him impressive to the subject or patient—great bodily strength or stature, fine clothes, a confident manner, superior abilities of any kind, age and experience, any reputation for special capacities, high social position or the occupation of any position of acknowledged authority; in short, all that is summed up by the term "personality," all that contributes to make a personality "magnetic" or to give it prestige renders it capable of evoking on the part of others the submissive suggestible attitude. A group of persons in agreement is capable of evoking the suggestible attitude far more effectively than any single member of the group, and the larger the group the more strongly does it exert this influence. Hence the suggestive force of the popularly accepted maxims and well-established social conventions; such propositions are collective suggestions which carry with them all the immense collective prestige of organized society, both of the present and the past; they embody the wisdom of the ages. It is in the main through the suggestive power of moral maxims, endowed with all the prestige of great moral teachers and of the collective voice of society, that the child is led to accept with but little questioning the code of morals of his age and country; and the propagation of all religious and other dogma rests on the same basis. The normal suggestibility of the child is thus a principal condition of its docility, and it is in the main by the operation of normal suggestion that society moulds the characters, sentiments and beliefs of its members, and renders the mass of its elements harmonious and homogeneous to the degree that is a necessary condition of its collective mental

life. Normal suggestion produces its most striking effects in the form of mass-suggestion, *i.e.*, when it operates in large assemblies or crowds, especially if the members have but little positive knowledge and culture.

Conditions very favourable to mass-suggestion prevailed during the middle ages of European history; for these "dark ages" were characterized by the existence of dense populations, among whom there was free intercourse but very little positive knowledge of nature, and who were dominated by a church wielding immense prestige. Hence the frequent and powerful operations of suggestion on a large scale. From time to time fantastic beliefs, giving rise to most extravagant behaviour, swept over large areas of Europe like virulent epidemics—epidemics of dancing, of flagellation, of hallucination, of belief in the miraculous powers of relics or of individuals, and so forth. At the present time, modified instances are the popular pilgrimages to Lourdes, Holywell and other places that acquire reputations for miraculous curative powers.

Auto-suggestion.—Although auto-suggestion does not strictly fall under the definition of suggestion given above, its usage to denote a mental process which produces effects very similar to those producible by suggestion is now so well established that it must be accepted In auto-suggestion a proposition is formulated in the mind of the subject rather than communicated from another mind, and is accepted with conviction in the absence of adequate logical grounds. Generally the belief is initiated by some external event or some bodily change, or through some interpretation of the behaviour of other persons; *e g*, a man falls on the road and a wagon very nearly passes over his legs, perhaps grazing them merely; when he is picked up, his legs are found to be paralysed. The event has induced the conviction that his legs are seriously injured, and this conviction operates so effectively as to realize itself. Or a savage, suffering some slight indisposition, interprets the behaviour of some person in a way which leads him to the conviction that this person is compassing his death by means of magical practices; accordingly he lies down in deep despondency and, in the course of some days or weeks, dies, unless his friends succeed in buying off, or in some way counteracting, the malign influence. Or, as a more familiar and trivial instance of auto-suggestion, we may cite the case of a man who, having taken a bread pill in the belief that it contains a strong purgative or emetic, realizes the results that he expects

SUHL, a town in Prussian Saxony, situated on the Lauter, in the Thuringian Forest. Pop. (1925) 15,557. Suhl, which obtained civic rights in 1527, formed a part of Saxony assigned to Prussia by the Congress of Vienna in 1815 The armourers of Suhl, mentioned in the 9th century, enjoyed their highest vogue from 1550 to 1634. The knights of south Germany especially prized the swords and armour of this town

SUICIDE, the act of intentional self-destruction. At the present time it is held to be reprehensible, if not indeed criminal, in ethics and in law. This was not always the case. Even in European countries it is not so very long ago that suicide was esteemed infinitely more honourable than disgrace.

Factors Affecting.—Much has been written as to the striking differences in the suicide-rate between one country and another. As to "occupational" suicide, the data are too meagre to allow of definite inferences. Climatic influences appear to be uniformly at work in most countries, the rate rising with the lengthening of the days and the increase of temperature and declining to minimum in winter Religion appears to have a modifying influence on suicide, Jews being less prone to self-destruction than Roman Catholics and Roman Catholics than Protestants, when living under similar conditions. Thus in Switzerland, the suicide-rate is invariably much higher in the Protestant than in the Roman Catholic cantons. According to the late Dr. Ogle, suicide is more common among the educated than the illiterate classes, and the latest statistics for England and Wales show it to be considerably higher in the two highest groups arranged according to social well-being than in the three lower ones. In the United States the suicide-rate for whites is considerably higher than that for negroes. Loss of interest in life itself is probably a powerful factor. There is the striking fact that the rate for unoccupied males in England and Wales is enormously greater than for those who are occupied. Generally speaking the rate is higher in the cities and large towns than in the rural areas.

Suicide by Sex and Age.—Men are much more prone to commit suicide than are women. In England and Wales, the proportions are about three to one—the rate for males in the quinquennium 1921–25 being 154 per million against 54 for females. In New Zealand, the disproportion was even greater, the respective rates being 192 and 46 In Germany, Italy and the Netherlands the ratio of male to female suicides was nearly as high as in England and Wales. Even in Japan, the male suicide rate is fifty per cent above that for females. In Europe, as in other parts of the world for which statistics are available, the suicide rate rises with age, the maximum being attained after 50 With women, however, the rise is not so regular as with men, there being a more decided rise at the earlier years 15 to 20 years. In 1926 the figures at age-groups were in England and Wales:—

	10–15	15–20	20–25	25–35	35–45	45–55	55–65	Over 65
Males	3	54	117	297	522	779	780	547
Females	3	58	80	203	272	340	258	136

Methods Employed.—The modes adopted by suicides to bring about their own destruction follow fairly well defined lines, men adopting the cruder methods and women avoiding in general those modes which involve the spilling of blood or personal disfigurement There are, however, what may be termed new fashions in suicide, while a determining factor is often the accessibility of the means to achieve the desired end The following brief table shows what happened in England and Wales in the case of the adoption of coal-gas as a means of self destruction

Suicides in England and Wales
(Years 1900–6)

	Males		Females		Both sexes	
		%		%		%
Total	17,455	100	5,752	100	23,207	100
By hanging	5,124	30	940	16	6,064	26
„ drowning	3,305	19	1,937	33	5,242	23
„ cutting	3,231	18	600	10	3,831	16
„ corrosives	2,240	13	1,517	26	3,757	16
„ gaseous poisons	98	0 6	28	0·5	126	0 5

(Years 1920–6)

	Males		Females		Both sexes	
		%		%		%
Total	21,680	100	7,782	100	29,462	100
By hanging	4,391	20	1,072	14	5,463	18
„ drowning	3,704	17	2,362	30	6,066	21
„ cutting	3,942	18	725	9	4,677	16
„ corrosives	1,656	8	1,366	17	3,022	10
„ gaseous poisoning	1,658	8	1,218	15	2,876	9

The most notable feature is, of course, the enormous rise in the suicides from gaseous poisoning during the present century. The following are, in order of preference, the methods adopted in recent years in some other countries.

Males		
United States	Italy	Switzerland
1 Firearms 2 Hanging 3 Poison gas 4 Corrosives	1 Firearms 2 Hanging 3 Drowning 4 Poison	1 Hanging 2 Firearms 3 Drowning ..
Females		
United States	Italy	Switzerland
1 Poison gas 2 Corrosives 3 Firearms 4 Drowning	1 Poison 2 Drowning 3 Hanging ..	1 Drowning 2 Hanging 3 Poison ..

In the cases of Italy and Switzerland, "poison" appears to include poisoning by corrosives and by gas. In Japan, hanging (1) and drowning (2) are the favourite methods for both sexes.

The Suicide-rate.—A careful investigation gives the impression that, from a variety of causes, the numbers of actual suicides is understated to a greater or less extent. For example, in England and Wales where an inquest has been held and an "open" verdict is returned, the death is not classified as suicide. In how many cases do we find the verdict "found drowned"? In most cases, probably, suicide is to be inferred. The suicide-rates here given err, therefore, on the side of understatement. But the variations in the suicide rate seem to be in an upward direction, at any rate up to the beginning of the present century.

For England and Wales the rates were:—

1871–75	66 per million living
1881–85	75 " " "
1891–95	88 " " "
1901–05	100 " " "
1911–14	99 " " "

In the following table the quinquennial suicide rate per million living is given for certain countries from 1871–75 onwards.

Country	Period				
	1871–75	1881–85	1891–95	1901–05	1911–14
Scotland	36	53	59	58	57
Ireland	18	22	29	33	32
Australia	99	98	117	125	131
Italy		50	60	64	85
Netherlands	31	50	60	64	63
Sweden	80	97	145	154	174
Switzerland	190	236	213	232	249

The variation in the suicide rate between the various countries for which statistics are available is very great:

Chile (1923)	24 per million living
Spain (1923)	37 " " "
Netherlands (1925)	62 " " "
Iceland (1925)	63 " " "
Colombia (1920)	84 " " "
Italy (1925)	92 " " "
Union of South Africa (whites only) (1923)	113 " " "
England and Wales (1926)	114 " " "
Australia (1926)	118 " " "
United States (1926)	128 " " "
New Zealand (1925)	130 " " "
Belgium (1922)	131 " " "
Denmark (1925)	136 " " "
Uruguay (1923)	136 " " "
France (1925)	200 " " "
Austria (1922)	228 " " "
Germany (1925)	243 " " "
Hungary (1922)	275 " " "

It has been stated that in any given country suicide is more frequent in the hotter months of the year and one would naturally conclude that in warmer countries the rate would be higher than in the colder ones. A glance at the above table shows that such is far from being the case. Within the United States the range of the rate from State to State was as great as that shown in the preceding table. The four States with the lowest and with the highest rates in 1925 were:—

South Carolina	32	Oregon	195
Mississippi	35	Wyoming	201
North Carolina	46	Washington	211
Alabama	50	California	267

In the larger cities it ranged from 68 in Cambridge, 72 in Lowell to 296 in Oakland and 388 in San Francisco. In Chicago it was 153, in New York 143.

Influence of the World War.—Complete records for the war period do not exist. However, the following figures, relating as they do to nine of the belligerent countries and two non-belligerents closely affected by war conditions show beyond any possibility of doubt the profound effect produced upon the suicide-rate by the World War. To the theory that nervous strain is one of the prime causes which lead to self-destruction, they give a complete and emphatic contradiction—while on the other hand, they furnish the most weighty volume of indirect evidence that, as stated earlier, lack of interest in life itself should be regarded as one of, if not *the*, most potent of the factors at work.

The following table shows the suicide rate per 1 million in the years immediately preceding, during and after the World War:

Country	Period		
	1911–14	1915–18	1921–25
England and Wales	99	73	101
Scotland	57	46	66
Australia	131	106	109
New Zealand	124	113	123
Union of South Africa	93	67	82
United States	162	138	116
Germany	222	168	221
Italy	85	73	88
Japan	200	180	217
Sweden	174	122	140
Switzerland	249	198	230

In every case the war-period is marked by a notable decline in the suicide-rate. And, in looking at these figures it must be borne in mind that the men withdrawn from civil life and consequently from the population under statistical review were not at the ages at which suicide becomes most prevalent. Had suicide remained at even the same level amongst the civilian population as before, the *general* rate would have risen owing to the smaller numbers at ages where suicide is at a lower level. Incidentally, although the fall in the rate was greater among men than among women, the latter did show a quite distinct decline. Here are the rates, by sexes for England and Wales:

	Per million living	
	Men	Women
1911–14	152	40
1915–18	111	44
1921–25	154	54

Thus, while the fall during the war for men was one of 37 per cent, for women it was 10 per cent. Here, finally are the percentage declines in the general suicide-rate during the years 1915–18 in the eleven countries under review:

	%		%
New Zealand	9	Switzerland	21
Italy	9·5	Germany	24
Japan	10	England and Wales	26
United States	15	Union of South Africa	28
Scotland	19	Sweden	30
Australia	19		

(S. DE J.)

SUIDAS, Greek lexicographer. Nothing is known of him, except that he must have lived before Eustathius (12th–13th century), who frequently quotes him. Under the heading "Adam" the author of the lexicon (which a prefatory note states to be "by Suidas") gives a brief chronology of the world, ending with the death of the emperor John Zimisces (975), and under "Constantinople" his successors Basil and Constantine are mentioned. It would thus appear that Suidas lived in the latter part of the 10th century. The lexicon of Suidas is arranged alphabetically with some slight deviations. It partakes of the nature of a dic-

tionary and encyclopaedia. It includes numerous quotations from ancient writers; the scholiasts on Aristophanes, Homer, Sophocles and Thucydides are also much used. The work deals with scriptural as well as pagan subjects, and doubtless the writer was a Christian A prefatory note gives a list of earlier dictionaries. Although the work is uncritical, interpolated, and very unequal, it contains much information on ancient history and life.

Editio princeps, by Demetrius Chalcondyles (1499), later editions by L. Kuster (1705), T. Gaisford (1834), G. Bernhardy (1834–53) and I. Bekker (1854); *see* A. Daub, *De S. Biographicorum origine et fide* (1880) and *Studien zu den Biografhika des S.* (1882); and J. E. Sandys, *Hist. of Classical Scholarship* (1906), p. 407.

SUI-FU (SU-CHOW-FU), a Chinese river port at the junction of the Minkiang and the Kin-sha-kiang, in south-west Szechwan. In the south of the province are favourable conditions for breeding the wax insect on the insect trees. The insects are taken at the end of April, travelling by night along the hillsides, to secure coolness and delay hatching, to the district of Kia-ting-fu, on the Minkiang, north of Sui-fu, where the insects are put on the trees, appear to contract a disease and secrete wax The wax is dealt in at Sui-fu. The town receives medicinal herbs and extracts, musk, etc., from Tibet, and metals from Yunnan; it exports cotton goods, chiefly to Yunnan. A recent estimate of the population gives a total of 125,000.

SUIJO-SUNAYE (sand-picture-on-water): *see* BON-SEKI.

SUINA, a group of non-ruminating artiodactyle ungulate mammals typified by the swine (*Suidae*), but also including the hippopotamus (*Hippopotamidae*), and certain extinct forms. (*See* ARTIODACTYLA; HIPPOPOTAMUS; PECCARY, SWINE.)

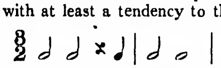
SUI-SEKI (stone-in-water): *see* BON-SEKI.

SUITE (*Suite de pièces; Ordre; Partita*), in music, a group of dance tunes in melodic forms (*see* SONATA FORMS). It consists essentially of four principal movements with the insertion of one or more lighter movements between the third and the last.

The first movement is the *allemande,* in slow common time and rich flowing rhythm, beginning with one or three short notes before the first full bar.

The second movement is the *courante,* of which there are two kinds. The French *courante* begins with one or three notes before the main beat, and is in a triple time ($\frac{3}{2}$) which, invariably at the cadences and sometimes elsewhere, drops into a crossing triple rhythm of twice the pace ($\frac{6}{4}$). In homage to Couperin, Bach often uses the French *courante,* but he is happier with the Italian type of *corrente,* a brilliant continuously running piece in quick triple time ($\frac{3}{4}$ or $\frac{3}{8}$).

The *sarabande* is a slow movement in triple time beginning on the full bar, and with at least a tendency to the rhythm



of which Handel's aria *Lascia ch'io pianga* is a familiar example. Bach's *sarabandes* are among the most simply eloquent and characteristic of his smaller compositions.

Then come the *galanteries,* from one to three in number. These are the only suite-movements (except some of Couperin's *courantes*) which can have an alternative section and a *da capo.* The commonest *galanteries* are: (1) the *minuet,* often with a second minuet which is called "trio" only when it is in real three-part writing; it is a little faster than the stately minuet in Mozart's *Don Giovanni,* and it always begins on the full bar. (2) The *gavotte,* a lively dance in a not too rapid *alla breve* time; the gavotte always begins on the half-bar. A second alternating gavotte is frequently founded on a pedal or drone-bass, and is then called *musette.* (3) The *bourrée,* which is not unlike the gavotte, but quicker, and beginning on the last quarter of the bar. (4) The *passepied,* a lively dance in quick triple time, beginning on the third beat. These dances are not always cast in binary form, and there are famous examples of gavottes and passepieds *en rondeau.* Other less common *galanteries* are: (5) the *loure,* a slow dance in $\frac{6}{4}$ time and dotted rhythm; (6) the *polonaise,* a leisurely triple-time piece, with cadences on the second instead of (as in later polonaises) the third beat of the bar; (7) the *air,* a short movement, quietly flowing, in a more florid style than its name would suggest. It sometimes precedes the sarabande.

The suite concludes with a *gigue,* in the finest examples of which the melodic binary form is combined with a light fugue style. The gigue is generally in some triplet rhythm, *e.g.,* $\frac{3}{8}$, $\frac{6}{8}$, $\frac{9}{8}$, $\frac{12}{8}$; but examples in a graver style may be found in slow square time with dotted rhythms, as in Bach's first French suite and the sixth Partita of the *Klavierubung.* In Couperin's first volume of *Ordres,* the *gigue* is followed by an enormous number of pieces which cannot have been intended to be all played on the same occasion, though they were all in the same key.

Suites on a large scale begin with a prelude in some larger form. Bach's French Suites have no preludes; his English Suites all have a great first movement which, except in the first suite, is in full *da capo* concerto form. His *Partitas* cover a wider range both in their preludes and their other contents. Some large suites have finales after the gigue, the great chaconne for violin solo being the finale of a partita (*see* VARIATIONS)

Examples illustrating the suite:

For another type of Gigue see SONATA FORMS, Ex. 1, and for a Gavotte see RONDO, Ex. 1.

In later times the term "suite" is more loosely employed.
(D. F. T.)

SUK, JOSEF (1874–), Czech violinist and composer, was born at Křečovice, Bohemia, on Jan. 4, 1874. He studied at Prague conservatorium, taking composition with Dvořák, whose daughter Ottilie he afterwards married He was a member of the celebrated Bohemian Quartet. He became (1924) director of the Conservatorium at Prague. His principal works are the symphonic poems: *Prague,* op. 26, *Asrael,* op. 27, *Summer Tale,* op. 29, and *Zrani,* op. 34 (1924); incidental music to the dramatized fairy-tale, *Raduz and Mahulena; Meditation on the choral St. Wenceslaus, Legend of Dead Victors* (a war work); piano pieces, settings of Serbian folk-songs, and chamber music, including a string quartet op. 35a.

SUKHOMLINOV, VLADIMIR (1848–1926), Russian general and war minister, was born in 1848. He took part in

the Russo-Turkish war as a staff officer (1877–78), and was head of the officers' cavalry school in St. Petersburg from 1886–97, being now promoted general. He was Russian war minister from 1909–16, and it was under him that the Russian orders for mobilization were given at the outbreak of the World War. He played a disastrous role in the administration of the Russian army, but it was only in 1916, under pressure of public opinion, that the Tsar Nicholas II. dismissed him from office. He was finally tried and sentenced to penal servitude on the charge of treason, but was freed by an amnesty granted by the Bolsheviks and went to Finland. In 1921 he began the publication of his memoirs, which were completed in 1924.

SUKHUM-KALEH, a Russian seaport on the Black Sea. It is in the Abkhasian S.S.R. Pop. (1926) 20,032. Sukhum Bay is sheltered by mountains and is never frozen, but the anchorage is poor. There is no railway link with the interior, though a line is under construction (1928); the site is marshy and malarial. It is the ancient Greek Dioskurias, and was in Turkish possession until 1829, since when it has been Russian except for temporary Turkish occupation in 1854 and 1877.

SUKKUR, a town and district in Sind, Bombay. The town stands on the right bank of the Indus 24 mi. S.E. of Shikarpur. Pop. (1921) 42,759. The river is now crossed by a cantilever bridge carrying the North-Western railway to Kotri.

The DISTRICT OF SUKKUR was created in 1901 out of part of Shikarpur district, the remainder of which was formed into the district of Larkana. Area, 5,606 sq.m.; pop. (1921) 510,292. It is chiefly alluvial plain, but there are slight hills at Sukkur and Rohri. A considerable part of the district is irrigated, the principal crops being wheat, millets, rice, pulses and oil seeds. Earthen, leathern and metal ware, cotton cloth and tussore silk are manufactured, also pipe-bowls, snuff-boxes and scissors. Lines of the North-Western railway serve the district, and there is a branch from Sukkur towards Quetta. Sukkur is the site of the proposed Lloyd Barrage of the Indus. The scheme, which is estimated to cost £12,000,000 will provide irrigation for 5·3 million acres.

SULA ISLANDS, a chain of islands (Sulla, Xulla, Dutch *Soela*), east of Celebes, Dutch East Indies, really an extension of the eastern peninsula of that island. There are three large islands, Taliabu, Mangola and Sula Besi, and several smaller ones. Taliabu and Mangola, very long and narrow, extend west and east (with Lisamatula), 135 miles. Both are mountainous, thickly forested, and thinly populated. Taliabu, the largest in area, very little known, is said to contain mountains from 3,000 to 4,000 ft. high, and hot springs. Mangola, which is much narrower than Taliabu, has Mt. Buja in its western part. Sula Besi, the smallest of the three, is well populated and cultivated. Wallace considers there is an approximation between the birds of the Sula isles and those of Buru, indicating that intervening land has disappeared. The babirusa and crested baboon of Buru are found in the Sula islands. Weber's Line, suggested as an alternative division between the Oriental and Australian zoological regions, in place of the Wallace Line, passes east of the Sula Islands, but west of Buru. The islands produce good timber for shipbuilding and the natives are good navigators. Damar is collected in the forests; rice, maize, tobacco and sugar-cane are grown on Sula Besi, where cultivation is far superior to that of the other islands, and the sago palm is common, forming the staple food on Taliabu and Mangola. Coal of inferior quality is found on Sula Besi, where the natives weave sarongs and plait mats. The population of the islands is estimated at 16,458, with 20 Europeans and Eurasians. The people resemble the natives of Buru and Ceram; Wallace thinks the Sula islanders are Malays from eastern Celebes. Most of the natives are pagans, but Mohammedanism is making headway, particularly in Sula Besi, the capital of which island, Sanana (pop. 1,725) is the residence of the *Gezaghebber* in charge of the islands, which form part of the residency of Ternate. Sanana, formerly the haunt of pirates, has a good roadstead, and is a port of call for vessels of the Royal Packet Navigation company. The Banggai or Peling islands, which lie off the western end of Taliabu, and also form part of the residency of Ternate, are little known, except that Peling is mountainous and well forested, with bays affording anchorage, but also with reefs. They furnish trepang and turtle. The people, who are mostly pagan, though Mohammedans live along the coast, are poor and miserably housed. Royal Packet Navigation vessels call at Banggai. The Sula and Banggai isles once formed part of the territory of the Sultan of Ternate and came under Dutch influence when, in 1683, the Dutch stripped the Sultan of his possessions.

(E. E. L.)

SULCI, an ancient town (mod. S. Antioco), on an island on the south-west of Sardinia and of Carthaginian origin. Its walls, of rectangular blocks of stone, can be traced for more than a mile. Phoenician and Roman antiquities, including statues, inscriptions, gems and a cistern of fine masonry, perhaps dating from the Punic period, have been found. The Phoenician tombs are cut in the rock, each measuring about 14 ft. square and 8 ft. high, and approached by a staircase: some are converted into dwellings. Curious sculptured *stelae* found in these tombs are in the museum of Cagliari. The goddess Tanit is represented, often in a form resembling Isis. The Roman tombs are simply rock trenches. There are catacombs originally Punic tombs, connected by passages in which was discovered the body of the martyr St. Antiochus, from whom the modern town takes its name. The church is cruciform, with heavy pillars and a dome: it is Byzantine. A fort occupies the highest point—the acropolis of the Punic period. The isthmus which, with bridges, connects the island with the mainland, is in part artificial. At Tratalías, on the mainland is the fine Romanesque church of S. Maria (12th–13th cent.), formerly the cathedral. At Sulci, the Carthaginian admiral Hannibal took refuge after his defeat by C. Sulpicius, but was crucified. (*See* PUNIC WARS.) In 46 B.C. the city was punished by Caesar for having helped Pompey's admiral Nasidius.

(T. A.)

SULEIMAN: *see* SOLIMAN.

SULEIMANIYE, an Iraqi town on the Persian frontier, on the caravan route from Baghdad to Tabriz. Pop. (mostly Kurds) probably somewhat over 10,000. There was formerly a large trade with Persia. The town gives its name to the administrative division.

SULGRAVE MANOR, the early English home of the ancestors of George Washington. Situated 2½m. N.W. of Helmdon in Northamptonshire, England, it is a notable shrine. Laurence Washington, twice mayor of Northampton, bought the property from King Henry VIII. in 1539, on the dissolution of

SULGRAVE MANOR, NORTHAMPTONSHIRE, THE ANCESTRAL HOME OF GEORGE WASHINGTON

the smaller religious houses. It had previously belonged to the priory of St. Andrew, Northampton. Laurence Washington, from whom George Washington was seventh in direct descent, and his children and grandchildren lived in the manor house until 1610.

Sulgrave Manor was purchased, in Jan. 1914, for £8,400, by the British committee for the celebration of 100 years of peace between Great Britain and the United States (1814–1914), and is vested in three ex-officio trustees: the American ambassador in London, the British ambassador in Washington and the regent of the Mount Vernon Ladies' Association of the Union.

It is partly restored to its original condition, and furnished with choice furniture of the period. A formal reopening took place, on June 21 1921. In 1927 the restoration was completed by the rebuilding of the western wing, which had been demolished in the 18th century. The funds were collected by the American Society of Colonial Dames, which body had, two years previously, raised a permanent endowment of over £20,000.

On the gable of the central porch are the royal arms of the Tudors; and in the right spandrel of the arch of the main doorway, the Washington Arms, three mullets and two bars, which were the origin of the Stars and Stripes, the American national flag. The furnishings are gifts from British and American donors, and include an original Gilbert Stuart portrait of George Washington and many other treasures. (L. of F.)

SULIDAE: *see* Gannet.

SULIMAN HILLS, a mountain system on the north-west frontier of India. The chief mass of the range is known as Takht-i-Suliman or Solomon's throne. The legend of the mountain is that Solomon visited Hindostan to marry Balkis, and that as they were returning through the air, on a throne supported by genii, the bride implored the bridegroom to let her look back for a few moments on her beloved land. Solomon directed the genii to scoop out a hollow for the throne on the summit of the mountain. The hollow is a cavity some 30 ft. square cut out of the solid rock, at the southern extremity of the mountain and is a place of pilgrimage for both Hindus and Mohammedans. The shrine is about 2 m. S. of the highest peak. The whole mountain culminates in two points, 11,070 ft. and 11,300 ft high.

SULINA, the second Black sea port of Rumania, and the only free port for imports. Pop. (1928) 8,000. Grain is brought down the Danube for ocean-going steamers. The port is under the European Danube Commission. The depth of water at the Sulina entrance to the Danube is 24 feet. The mouth is generally blocked with ice in the winter.

SULITJELMA, a mountain (6,158 ft.) on the frontier between Norway and Sweden. It is covered with a snow-field from which many glaciers descend. The mountain is famous as a source of pyrites, rich in copper, which occurs as lodes in schists. From Sjönstaa steamers on the Langvand and a light railway give communication between the sea and Furulund, the mining centre.

SULLA, LUCIUS CORNELIUS (138–78 B.C.), surnamed Felix, Roman general, politician and dictator, belonged to a minor and impoverished branch of the famous patrician Cornelian gens. He was quaestor in 107 under Marius, for whom he commanded the cavalry in the Jugurthian war. The surrender of Jugurtha was made to Sulla, and was the beginning of the rivalry with Marius. Sulla won the enthusiastic devotion of his troops From 104 to 101 he served again under Marius in the war with the Cimbri and Teutons and fought in the last great battle in the Raudian plains near Verona. In 93 he was elected praetor after a lavish squandering of money and he delighted the populace with an exhibition of a hundred lions from Africa. Next year (92) he went as propraetor of Cilicia with special authority from the senate to make Mithradates VI. of Pontus restore Cappadocia to Ariobarzanes, one of Rome's dependants in Asia. This he did, subsequently receiving an embassy from the Parthians asking alliance with Rome. In 91 he returned to Rome, now one of the leading men on the senatorial side. He outshone Marius in the Social War by defeating the Samnites and taking Bovianum.

Consul.—Sulla was consul in 88, and finished the revolt by the capture of Nola Meanwhile he had obtained by lot the command against Mithradates; Marius wanted that, and in order to get it entered into a coalition with Sulpicius Rufus, who had a plan of revolutionary legislation to carry out. Sulpicius, quite unconstitutionally, transferred the command to Marius by vote of the assembly. Rioting took place at Rome at the prompting of the popular leaders, Sulla narrowly escaping to his legions in Campania, whence he marched on Rome, being the first Roman who entered the city at the head of a Roman army. Sulpicius was put to death, and Marius fled. Sulla, leaving things quiet at Rome, quitted Italy in 87, and for the next four years he was winning victory after victory against the armies of Mithradates and accumulating boundless plunder. Athens, the headquarters of the Mithradatic cause, was taken and sacked in 86; and in the same year, at Chaeroneia, the scene of Philip II. of Macedon's victory more than two and a half centuries before, and in the year following, at the neighbouring Orchomenus, he scattered immense hosts of the enemy with trifling loss to himself. Crossing the Hellespont in 84 into Asia, he was joined by the troops of C. Flavius Fimbria, who soon deserted their general, a man sent out by the Marian party, now again in the ascendant at Rome. The same year peace was concluded with Mithradates.

Sulla returned to Italy in 83, landing at Brundisium. Marius had died in 86, and the revolutionary party, specially represented by L. Cornelius Cinna, Cn. Papirius Carbo and the younger Marius, had massacred Sulla's supporters wholesale, confiscated his property, and declared him a public enemy. They had large forces ready to meet him, but Sulla's declaration that he did not intend to deprive the Italians of the franchise cut the ground from under their feet, and only the Samnites remained in arms.

In the following year (82) he won a decisive victory over the younger Marius near Praeneste (mod. Palestrina) and then marched upon Rome, where again, just before his defeat of Marius, there had been a great massacre of his adherents, in which the learned jurist Q. Mucius Scaevola perished. Rome was at the same time in extreme peril from the advance of a Samnite army, and was barely saved by Sulla, who, after a hard-fought battle, routed the enemy under Pontius Telesinus at the Colline gate of Rome With the death of the younger Marius, who killed himself after the surrender of Praeneste, the civil war was at an end, and Sulla was master of Rome. Then came the memorable "proscription," when for the first time in Roman history a list of men declared to be outlaws and public enemies was exhibited in the forum, so starting a reign of terror.

Dictator.—The title of "dictator" was revived and Sulla was in fact emperor of Rome. After celebrating a splendid triumph for the Mithradatic War and assuming the surname of "Felix" he carried in 80 and 70 his great political reforms (*see* Rome: *History*). Their effect was to establish the senate by law in the position which it had held unchallenged by custom until the Gracchi, to systematise the provincial arrangements, and to set up a permanent organization for the courts of justice. The mainstay of his political system was to be the military colonies which he had established with grants of land throughout every part of Italy, to the final ruin of Italian agriculture.

In 79 Sulla resigned his dictatorship and retired to Puteoli (mod. Pozzuoli), where he died in the following year, probably, from the bursting of a blood-vessel in a fit of passion. The "half-lion, half fox," as his enemies called him, the "Don Juan of politics" (Mommsen), the man who carried out a policy of "blood and iron" with a grim humour, amused himself in his last days with actors and actresses, with dabbling in poetry and completing his *Memoires* (*see* H. Peter, *Historicorum romanorum reliquiae*).

He was accorded a magnificent public funeral, his body being removed to Rome and buried in the Campus Martius His monument bore an inscription written by himself, to the effect that he had always fully repaid the kindnesses of his friends and the wrongs done him by his enemies. His reforms, mechanically excellent, were all falling to pieces before his death, except the *quaestiones perpetuae,* which became the basis of Roman criminal justice. He tried in vain to put the clock back.

Bibliography.—The ancient authorities for Sulla and his time are his *Life* by Plutarch (who made use of the *Memoirs*); Appian, *Bell. civ.;* for the references in Cicero *see* Orelli's *Onomasticon Tullianum.* Modern treatises by C. S. Zachariä, *L. Cornelius S. als Ordner des römischen Freystaates* (1834); T. Lau, *Lucius Cornelius Sulla* (1855); E. Linden, *De bello civili Sullano* (1896); P. Cantalupi, *La Guerra civile Sullana in Italia* (1892); C. W. Oman, *Seven Roman Statesmen* (1902); F. D. Gerlach, *Marius und Sulla* (1856); J. M. Sunden, "De tribunicia potestate a Lucio Sulla imminuta" in *Skrifter utgifna af k. humanistika Vetenskapssamfundet i Uppsala,* v., 1897, in which it is argued against Mommsen that Sulla did not deprive the tribunes of the right of proposing rogations. *See* also Mommsen's *History of Rome,* vol. iii., bk. iv., ch. 8, 9; Drumann, *Geschichte Roms,* 2nd ed. by Groebe, ii. 364–432; Pauly-Wissowa, *Realencyklopädie,* iv.

SULLIVAN, SIR ARTHUR SEYMOUR (1842–1900), English composer, was born in Lambeth on May 13, 1842, being the son of a cultivated Irish musician who was bandmaster at the Royal Military College, Sandhurst, from 1845 to 1856, and taught at the Military School of Music at Kneller Hall from 1857 till his death in 1866. His mother, *née* Mary Coghlan (1811–1882), had Italian blood in her veins. Arthur Sullivan was brought up to music from boyhood, and he had learnt to play every wind instrument in his father's band by the age of eight. He also had a fine treble voice, and became a chorister of the Chapel Royal. In 1856 he won the Mendelssohn scholarship at the Royal Academy, where he studied under Sterndale Bennett, Arthur O'Leary and John Goss. In 1858 he was sent to study at Leipzig, where he had for teachers Moscheles and Plaidy for pianoforte, Hauptmann for counterpoint, Rietz and Reinecke for composition, and F. David for orchestral playing and conducting.

After two years' hard study he returned to London in April 1861 and at his instigation Schumann's first symphony was introduced at one of the Crystal Palace winter concerts. The following year his own *Tempest* music was performed at the same concerts. Then followed his *Kenilworth* cantata (remembered chiefly for the charming duet, "How Sweet the Moonlight"), the *Sapphire Necklace* overture, and the five beautiful songs from Shakespeare, which include "Orpheus with his Lute," "Oh Mistress Mine" and "The Willow Song." His attractive personality, combined with his undoubted genius and brilliant promise, brought him many friends. Costa, who was conductor at Covent Garden, gave him the post of organist, and in 1864 he produced there his *L'Ile Enchantée* ballet. Other works followed, and in 1867 he first showed his genius for light operatic music in his collaboration with F. C. Burnand in *Cox and Box* and in *Contrabandista*.

In 1871 Sullivan had become acquainted with W. S. Gilbert (*q.v.*), and in 1872 they collaborated in a piece for the Gaiety Theatre, called *Thespis; or, The Gods Grown Old,* which was a great success in spite of the limited vocal resources of the performers. In 1875 R. D'Oyly Carte, then acting as manager for Selina Dolaro at the Royalty, suggested to Gilbert collaboration with Sullivan in a piece for that theatre. Gilbert had already suggested to Sullivan an operetta with its scene in a law court, and within three weeks of his completing the libretto of *Trial by Jury* the music was written. The piece succeeded beyond all expectation; and on the strength of its promise of further successes D'Oyly Carte formed his Comedy Opera Company and took the Opéra Comique Theatre. There in 1877 *The Sorcerer* was produced, George Grossmith and Rutland Barrington being in the cast. In 1878 *H.M.S. Pinafore* was brought out at the Opéra Comique, and ran for 700 nights. In America it was enthusiastically received and pirated right and left and the two authors, with D'Oyly Carte, went over to the States in 1879, with a company of their own, in order to produce it in New York. To secure the American rights for their next opera, they brought out *The Pirates of Penzance* first at New York in 1879. In 1880, in London, it ran for nearly 400 nights. In 1881 *Patience* was produced at the Opéra Comique, and was transferred later in the year to the Savoy Theatre. There all the following operas came out: *Iolanthe* (1882), *Princess Ida* (1884), *The Mikado* (1885), *Ruddigore* (1887), *The Yeomen of the Guard* (1888), *The Gondoliers* (1889). The vogue of the new type of light opera owed something to such admirable performers as George Grossmith, Rutland Barrington, Miss Jessie Bond, Miss Brandram, and later W. H. Denny and Walter Passmore; but these artistes only took advantage of the opportunities provided by the two authors. In place of the old adaptations of French *opéra bouffe* they had substituted a genuinely English product, humorous and delightful, without a tinge of vulgarity or the commonplace. But disagreements arose between them which caused a dissolution of partnership. Sullivan's next Savoy opera, *Haddon Hall* (1892), had a libretto by Sydney Grundy; and the resumption of Gilbert's collaboration in 1893 in *Utopia, Limited,* and again in 1896 in *The Grand Duke,* was not as successful as before. Sullivan's music, however, still showed its characteristic qualities in *The Chieftain* (1894)—largely an adaptation of *Contrabandista; The Beauty Stone* (1898), with a libretto by A. W. Pinero and J. Comyns Carr; and particularly in *The Rose of Persia* (1900), with Basil Hood.

In 1872 Sullivan's *Te Deum* for the recovery of the prince of Wales was performed at the Crystal Palace. In 1873 he produced at the Birmingham Musical Festival his oratorio *The Light of the World,* in 1877 he wrote his incidental music to *Henry VIII.*, in 1880 his sacred cantata *The Martyr of Antioch,* and in 1886 *The Golden Legend* was brought out at the Leeds Festival. In 1891, for the opening of D'Oyly Carte's new English opera-house in Shaftesbury Avenue, now the Palace Theatre, he wrote his "grand opera" *Ivanhoe* to a libretto by Julian Sturgis. The attempt to put an English opera on the stage for a long run was doomed to failure, but *Ivanhoe* contains many admirable pages. In 1892 he composed incidental music to Tennyson's *Foresters.* In 1897 he wrote a ballet for the Alhambra, called *Victoria and Merrie England.* Among his numerous songs, the best known are "Orpheus with his Lute," "Thou'rt Passing Hence" and, most famous of all, "The Lost Chord." This last, hackneyed as it became, was probably the most successful English song of the 19th century. The hymn tune, "Onward, Christian Soldiers!" (1872) shows Sullivan in another light. In 1876 he accepted the principalship of the National Training School of Music, which he held for six years; this was the germ of the subsequent Royal College. He was conductor of the Leeds Festivals from 1879 to 1898, besides being conductor of the Philharmonic Society in 1885. He died on Nov. 22, 1900 and was buried in St. Paul's cathedral. Among works which he left unpublished may be mentioned a *Te Deum* written for performance at the end of the Boer War, and an unfinished Savoy opera to a libretto by Basil Hood, which, completed by Edward German, was produced in 1901 as *The Emerald Isle.*

Sullivan was the one really popular English composer of any artistic standing in his time. One of the most agreeable companions, broad-minded, and free from all affectation, he was intensely admired and loved in all circles of society; and though he suffered during many years from a painful ailment, he enjoyed life without being spoilt by success.

See A. Lawrence, *Sir Arthur Sullivan: Life Story, Letters and Reminiscences* (1899); H. Saxe-Wyndham, *Arthur Seymour Sullivan* (1926); Herbert Sullivan and Newman Flower, *Sir Arthur Sullivan, His Life, Letters and Diaries* (1928).

SULLIVAN, JOHN (1740–1795), American soldier, was born in Somersworth (now Rollinsford), N.H., on Feb. 17, 1740. He practised law at Berwick, Maine, and at Durham, N.H., was a member of the New Hampshire Provisional Assembly (1774), and also a member of the first Continental Congress. In June, 1775, he was appointed brigadier-general in the Continental Army, and aided in the siege of Boston. In the same year, he took command of the American army in Canada, and exhibited great skill in effecting a retreat from that province. Soon afterward, having been superseded in command by General Gates, he rejoined Washington's army and took part in the battle of Long Island, where he was taken prisoner. In December he was exchanged, and succeeded General Charles Lee in command as major-general of the right wing of Washington's army. In the battle of Trenton he led an attack on the Hessians, and on Aug. 22, 1777, he led a night attack against the British and Loyalists on Staten Island. He commanded the American right in the battle of Brandywine and took part in the battle of Germantown. In March 1778 he was placed in command in Rhode Island, and in the following summer plans were made for his co-operation with the French fleet under Count d'Estaing in an attack on Newport.

The Indian raids in western New York, especially the atrocities in the Wyoming and Cherry valleys caused a retaliatory expedition to be sent to "chastise and humble the Six Nations," and Sullivan was chosen to lead the expedition. With about 4,000 men, he defeated the Iroquois and their Loyalist allies at Newtown (now Elmira, N.Y.), burned their villages, and destroyed their orchards and crops. Although severely criticized for his conduct of the expedition, he received the thanks of Congress in October 1779, and in November resigned from the army. Sullivan was

again a delegate to the Continental Congress in 1780–81 and from 1782 to 1785 he was attorney-general of New Hampshire. He was president of the State in 1786–87 and in 1789, and in 1786 suppressed an insurrection at Exeter immediately preceding the Shays Rebellion in Massachusetts. He presided over the New Hampshire convention which ratified the Federal Constitution in June 1788. From 1789 until his death at Durham, on Jan. 28, 1795, he was United States district judge in New Hampshire.

See O. W. B. Peabody, "Life of John Sullivan" in Jared Sparks's *Library of American Biography*, vol. iii. (1844); G. S. Conover, *Journals of the Military Expedition of Major John Sullivan against the Six Nations* (1887); Oscar E Rising, *A New Hampshire Lawyer in General Washington's Army* (Geneva, N.Y., 1915).

SULLIVAN, a city of south-western Indiana, U.S.A., on federal highway 41, 26 m S of Terre Haute; the county-seat of Sullivan county. It is served by the Chicago and Eastern Illinois, the Chicago, Milwaukee, St. Paul and Pacific, and the Illinois Central railways. The population was 4,489 in 1920 (97% native white). It is in one of the principal coalfields of the State, and there are oil-wells near by. The city was founded in 1842 and incorporated in 1909.

SULLY, JAMES (1842–1923), English psychologist, was born on the 3rd of March 1842 at Bridgwater, and was educated at the Independent college, Taunton, the Regent's Park college, Göttingen and Berlin. He was originally destined for the Nonconformist ministry, but in 1871 adopted a literary and philosophic career. He was Grote professor of the philosophy of mind logic at University college, London, from 1892 to 1903, when he was succeeded by Carveth Read. An adherent of the associationist school of psychology, his views had great affinity with those of Alexander Bain. His monographs, as that on pessimism, are ably and readably written, and his text-books, of which *The Human Mind* (1892) is the most important, are models of sound exposition He died at Richmond, Surrey, on Oct 31, 1923

WORKS.—*Sensation and Intuition* (1874), *Pessimism* (1877), *Illusions* (1881, 4th ed, 1895), *Outlines of Psychology* (1884; many editions), *Teacher's Handbook of Psychology* (1886), *Studies of Childhood* (1895), *Children's Ways* (1897), and *An Essay on Laughter* (1902).

SULLY, MAXIMILIEN DE BÉTHUNE, DUC DE (1560–1641), French statesman, was born at the château of Rosny near Mantes, on Dec. 13, 1560, son of François de Béthune, baron de Rosny (1532–1575). Brought up in the Reformed faith, Maximilien joined the court of Henry of Navarre in 1571. He was taken to Paris by his patron, and was studying at the college of Bourgogne at the time of the St. Bartholomew massacre, from which he escaped by discreetly carrying a book of hours under his arm. On the outbreak of civil war in 1575 he enlisted in the Huguenot army. In 1576 he accompanied the duke of Anjou on an expedition into the Netherlands in order to regain the former Rosny estates, but being unsuccessful he attached himself for a time to the prince of Orange. Later rejoining Henry of Navarre in Guienne, he displayed particular ability as an engineer. In 1583 he was Henry's special agent in Paris. In 1584 he married Anne de Courtenay, a wealthy heiress, who died, however, in 1589. On the renewal of civil war Rosny again joined Henry of Navarre, and at the battle of Ivry (1590) was seriously wounded. He counselled Henry IV.'s conversion to Roman Catholicism, but steadfastly refused himself to become a Roman Catholic.

Rosny became a member of the king's council of finance in 1596, and appears to have been sole superintendent as early as 1598. He authorized the free exportation of grain and wine, reduced legal interest from 8⅓ to 6¼%, established a special court for trial of cases of peculation, forbade provincial governors to raise money on their own authority, and otherwise removed many abuses of tax-collecting, abolished several offices, and by his honest, rigorous conduct of the country's finances was able to save between 1600 and 1610 an average of a million livres a year His achievements were by no means solely financial. In 1599 he was appointed grand commissioner of highways and public works, superintendent of fortifications and grand master of artillery; in 1602 governor of Mantes and of Jargeau, captain-general of the queen's gens d'armes and governor of the Bastille; in 1604 governor of Poitou; and in 1606 duke and peer of Sully, ranking next to princes of the blood He declined the office of constable because he would not become a Roman Catholic. Sully encouraged agriculture, urged the free circulation of produce, promoted stock-raising, forbade the destruction of the forests, drained swamps, built roads and bridges, planned a vast system of canals and actually began the canal of Briare He strengthened the French military establishment; under his direction Évrard began the construction of a great line of defences on the frontiers. Sully opposed the king's colonial policy as inconsistent with the French genius, and likewise showed little favour to industrial pursuits, although on the urgent solicitation of the king he established a few silk factories. He fought in company with Henry IV. in Savoy (1600–1601) and negotiated the treaty of peace in 1602; in 1603 he represented Henry at the court of James I. of England; and throughout the reign he helped the king to put down insurrections of the nobles, whether Roman Catholic or Protestant. It was Sully, too, who arranged the marriage between Henry IV. and Marie de Médicis.

The political rôle of Sully practically ended with the assassination of Henry IV. on May 14, 1610. Although a member of the council of regency, his colleagues were not disposed to brook his domineering leadership, and after a stormy debate he resigned as superintendent of finances on Jan. 26, 1611, and retired to private life. The baton of marshal of France was conferred on him on Sept. 18, 1634. He died at Villebon, on Dec. 22, 1641.

Sully was hated by Catholics because he was a Protestant, by Protestants because he was faithful to the king. He was an excellent man of business, inexorable in punishing malversation and opposed to the ruinous expenditure which was the bane of European monarchies. He was implicitly trusted by Henry IV., and contributed greatly to the recovery of France.

Sully left a curious collection of memoirs bearing the title, *Mémoires des sages et royales oeconomies d'estat, domestiques, politiques, et militaires de Henry le Grand. . . .* The *Mémoires* are very valuable for the history of the time, though they contain fictitious matter such as a mission by Sully to England in 1601, and the "grand design" for a Christian republic. The best edition of the original is that in J. F. Michaud and J. J. F. Poujoulat, *Nouvelle collection des mémoires relatifs à l'histoire de France* (1854), vols. xvi–xvii. An English translation by Charlotte Lennox appeared in 1756 and was later revised and republished (4 vols, London, 1856)

See E. Lavisse, *Sully* (Paris, 1880), G. Fagniez, *Économie sociale de la France sous Henri IV.* (Paris, 1897)

SULLY, THOMAS (1783–1872), American artist, was born at Horncastle, England, on June 8, 1783 His parents, who were actors, took him to America, when he was nine years old, settling at Charleston (S C), and he was first instructed in art by a French miniature painter. Afterwards he was a pupil of Gilbert Stuart in Boston, and in 1809 he went to London and entered the studio of Benjamin West He returned in 1810, and made Philadelphia his home, but in 1837 again visited London, where he painted a full-length portrait of Queen Victoria for the St George's Society of Philadelphia. Sully was one of the best of the early American painters He died in Philadelphia on Nov. 5, 1872 Among his portraits are those of Comm. Decatur (City Hall, New York); the actor, George Frederick Cooke, as Richard III. (Pennsylvania Academy of the Fine Arts, Philadelphia); Lafayette (Independence Hall); Thomas Jefferson (U.S. Military Academy, West Point, N Y.) and Charles and Frances Anne Kemble, and Reverdy Johnson.

SULLY-PRUDHOMME, RENE FRANÇOIS ARMAND PRUDHOMME (1839–1907), French poet, born in Paris, March 16, 1839, was educated at the Lycée Bonaparte, where he took his degree as Bachelier ès Sciences. An attack of ophthalmia interrupted his studies and necessitated an entire change in the course of his career. He found employment for a time in the Schneider factory at Creuzot, but he soon abandoned an occupation to which he was eminently unsuited. He subsequently entered a notary's office in Paris. It was during this period that he composed those early poems which were not long in acquiring celebrity among an ever-widening circle of friends. In 1865 he published his first volume of poems, which was favourably reviewed by Sainte-Beuve, to whose notice it had been brought by Gaston Paris. It was at this moment that the small circle of

which Leconte de Lisle was the centre were preparing the *Parnasse*, to which Sully-Prudhomme contributed several pieces. In 1866 Lemerre published a new edition of the *Stances et poèmes* and a collection of sonnets entitled *Les Épreuves* (1866). From this time forward Sully-Prudhomme devoted his life entirely to poetry. It was in the volume of *Les Épreuves* that the note of melancholy which was to dominate through the whole work of his life was first clearly discernible. In 1869 he published a translation of the first book of Lucretius with a preface, and *Les Solitudes*. In 1870 a series of domestic bereavements and a serious paralytic illness resulting from the strain and fatigue of the winter of 1870, during which he served in the Garde Mobile, shattered his health. In 1872 he published *Les Écuries d'Augias*, *Croquis italiens*, *Impressions de la guerre* (1866–72) and *Les Destins*, *La Révolte des heurs* in 1874, in 1875 *Les vaines Tendresses*, in 1878 *La Justice*, in 1886 *Le Prisme*, and in 1888 *Le Bonheur*. All these poems were collected and republished under the title of *Poésies*, occupying four volumes of his *Oeuvres* (6 vols., 1883–1904). After the publication of *Le Bonheur* he practically ceased to produce verse, and devoted himself almost entirely to philosophy. He published two volumes of prose criticism *L'expression dans les beaux arts* (1884) and *Réflexions sur l'art des vers* (1892). Various monographs by him appeared from time to time in the philosophical reviews, and among them a remarkable series of essays (*Revue des deux mondes*, Oct. 15th, Nov. 15th, 1890) on Pascal, and a valuable study on the "Psychologie du libre arbitre" in the *Revue de métaphysique et de morale* (1906). He was elected to the Academy on the 8th of December 1881. On the 10th of December 1901 he was awarded the Nobel prize for literature, and devoted most of the money to the foundation of a prize for poetry to be awarded by the *Société des gens de lettres*. He was one of the earliest champions of Captain Dreyfus. In 1902 he wrote, in collaboration with Charles Richet, *Le Problème des causes finales*. During his later years he lived at Châtenay in great isolation, a victim of perpetual ill-health, and mainly occupied with his *Vraie religion selon Pascal* (1905). He had been partially paralysed for some time when he died suddenly on the 6th of September 1907. He left a volume of unpublished verse and a prose work, *Le Lien social*, which was a revision of an introduction which he had contributed to Michelet's *La Bible de l'humanité*. *See* C. Hémon, *La Philosophie de Sully-Prudhomme* (1907), *Sully-Prudhomme* by E. Zyromski (Paris 1907).

SULMONA (anc. *Sulmo*), a city of the Abruzzi, Italy. Pop. (1921), 16,676 (town), 18,797 (commune). Sulmona is situated at a height of 1,322 ft. above the sea on the Gizio, a tributary of the Pescara, which supplies water-power to its paper-mills, fulling-mills and copper-works. Its cathedral of San Panfilo has a 14th-century portal, and an 11th-century crypt. S. Maria della Tomba is a good Gothic church. S. Francesco della Scarpa occupies the site of an older and larger church, the Romanesque portal of which still stands at the end of the Corso Ovidio, and forms the entrance to the market. Opposite is a picturesque aqueduct of 1256 with pointed arches, which supplies the Renaissance Fontana del Vecchio (1474). S. Agostino has a good Gothic portal. The Palazzo dell' Annunziata, begun in 1320, shows an interesting and successful mixture of Gothic and Renaissance styles. In the court of the grammar school is a fine 15th-century statue of Ovid, the most celebrated native of the town, whose memory is preserved among the peasants in songs and folk-lore, and outside is a good monument to him by Ettore Ferrari (1925). The Porta Napoli is an interesting gate of the 14th century. Innocent VII. was a native of the town. In the vicinity of the town is Monte Morrone where Pietro da Morrone lived as a hermit and founded a monastery for his hermits, who after his elevation to the papacy as Celestine V. (1294) took the name of Celestines; the monastery (S. Spirito) is now a prison.

Sulmo was devastated by Hannibal (211 B.C.). It was famous for its ironsmiths. Charles V. bestowed it on Charles Launoy, who had captured Francis I. at the battle of Pavia. The town has suffered much from earthquakes.

SULPHONAL GROUP, THE. This group of hypnotics includes *sulphonal*, *methyl sulphonal* known under the trade name of "trional" and *ethyl sulphonal* known as "tetronal," both of which are scheduled as poisons.

Sulphonal, or acetone diethyl sulphone $(CH_3)_2C(SO_2C_2H_5)_2$, crystallizes in prisms melting at 125° C, which are practically insoluble in cold water, but dissolve in 15 parts of hot and also in alcohol and ether. It is the *sulphonalum* of the B.P. and the *sulphomethanum* of the U.S.P. It is prepared by condensing acetone (*q.v.*) with ethyl mercaptan in the presence of hydrochloric acid, the mercaptol $(CH_3)_2C(SC_2H_5)_2$ formed being subsequently oxidized by potassium permanganate. Dose 10 to 30 grains. *Trional* $(CH_3)(C_2H_5)C(SO_2C_2H_5)_2$ is slightly more soluble in cold water than Sulphonal (1 in 320). Dose 10 to 20 grains. *Tetronal* $(C_2H_5)_2C(SO_2C_2H_5)_2$ is less soluble in cold water than sulphonal (1 in 550). Dose 10 to 20 grains. All three substances are white crystalline powders, odourless and almost tasteless.

Sulphonal was discovered by Baumann and introduced into medical practice in 1888. The derivatives trional and tetronal were introduced soon afterwards. These drugs came into general use as hypnotics and were found specially valuable in calming motor excitement. They have been very largely used in mental cases and asylum practice. Their low solubility and slow absorption cause a delayed action. They have been recommended for calming the motor excitement in chorea, but great care is necessary if they are used for this purpose owing to the tender age of choreic patients and to the toxic action of the drugs.

Cumulative action may occur if the drugs are given in frequently repeated doses since owing to the slow absorption a large quantity may accumulate in the alimentary tract. Absorption over a large area may then occur and give rise to toxic symptoms some time after the initial doses were administered. They should be taken with a large quantity of hot water about four hours before the time it is desired that sleep should ensue. Constipation should be guarded against to avoid retention of the unabsorbed drug.

Owing to their slow absorption and consequent somewhat uncertain and delayed action in producing sleep these drugs have in recent years become largely displaced by the barbituric acid (*q.v.*) hypnotics which have a rapid and more certain action.

Toxic Effects.—When first introduced it was thought that the sulphonal group were harmless hypnotics. But an overdose will cause a condition of deep stupor followed by loss of consciousness from which the patient cannot be roused (coma). This comatose condition may last some days and there is in this stage great danger of the development of fatal broncho-pneumonia.

Chronic sulphonal poisoning may follow the continued daily use of full therapeutic doses, and symptoms may occur which simulate organic disease of the nervous system. Thus headache, drowsiness, vertigo and severe mental depression may result. The speech may become thick and articulation indistinct. The gait may become ataxic and reeling in type like that of alcoholic intoxication or cerebellar disease. Paralytic symptoms such as squint, ptosis, diplopia, nystagmus or facial weakness may occur. Skin rashes have frequently occurred in patients who have been taking sulphonal in repeated doses; they may be of urticarial or erythematous type and are often associated with severe itching and irritation (prurigo). Vesicular and bullous eruptions and purpura have been described. A common symptom of chronic sulphonal poisoning is the presence of altered blood pigment in the urine (haematoporphyrinuria), the urine becoming claret coloured. In some cases albumen and casts may appear in the urine due to the irritating action of the drugs on the kidneys. (W. H. Wi.)

Drug addiction (*q.v.*) is common. The mental depression not infrequently leads to the taking of a large overdose.

SULPHONIC ACIDS, organic acids containing sulphur and having the general formula, $R{\cdot}SO_3H$, where R is either an alkyl or an aryl radical. (*See* CHEMISTRY, ORGANIC.)

Aromatic Sulphonic Acids.—The acids of this more important group are obtained generally by digesting aromatic compounds with concentrated sulphuric acid, the process being called sulphonation. Such operations are frequently conducted on a manufacturing scale as in the preparation of the sulphonic acids of benzene (*q.v.*), naphthalene (*q.v.*) and anthraquinone (*q.v.*).

The sodium salt of benzenesulphonic acid is of importance since on fusion with caustic soda it yields phenol. During the World War large quantities of synthetic phenol were made by this process in order to eke out the supply of coal tar phenol, which was then insufficient for the wholesale production of the explosive, picric acid (*q v*). Benzenedisulphonic acid, made from oleum (fuming sulphuric acid) and benzene, yields by alkali fusion the important colour intermediate, resorcinol.

The sulphonic acids of naphthalene are manufactured on an extensive scale, for by alkali fusion naphthalene-α-sulphonic acid, made by low-temperature sulphonation, yields α-naphthol, whereas naphthalene-β-sulphonic acid, prepared at 140° C, when similarly treated, furnishes β-naphthol

Anthraquinone, the oxidation product of anthracene (*q.v*), when sulphonated with oleum at high temperatures yields anthraquinone-β-sulphonic acid, the sodium salt of which ("silver salt") is an important intermediate used in the manufacture of alizarin (*q v.*) and the indanthrene vat colours. (*See* DYES, SYNTHETIC.) Sulphonation of anthraquinone is facilitated by a mercuric sulphate catalyst, and in this way anthraquinone-1.5- and -1.8-disulphonic acids are produced. These disulphonic acids are also used as intermediates in the dye industry Sulphonation may be effected by chlorosulphonic acid whereby sulphonic chlorides are formed. (*See* SACCHARIN)

In addition to direct sulphonation, the sulphonic group may be introduced into the aromatic nucleus through the diazo-reaction (*see* DIAZO-COMPOUNDS).

Sulphonic acids of aromatic hydrocarbons are very soluble in water and when obtained crystalline are extremely hygroscopic With phosphorus pentachloride they yield sulphonic chlorides, which are reducible to thiophenols On distillation with sodium cyanide or ferrocyanide the sodium arylsulphonates give rise to nitriles.

Sulphanilic acid, a sulphonic acid of aniline, is sparingly soluble in cold water and is to be regarded as an internal salt,

$$\overset{+}{N}H_3 \cdot C_6H_4 \overset{-}{S}O_3$$

This compound and the similar naphthylamine sulphonic acids are important colour intermediates

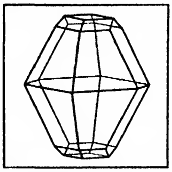
Aliphatic Sulphonic Acids are much less important than those of the aromatic series. They are obtained generally (i) by the oxidation of mercaptans, alkyl disulphides, alkyl thiocyanates or alkyl sulphinic acids; (ii.) by the interaction of alkyl iodides and metallic sulphites, (iii.) by direct action of sulphur trioxide on hexane and its homologues (J. Worstall, 1898). They are either viscous liquids or crystalline solids, converted into sulphonic chlorides by phosphorus pentachloride and into alcohols and alkali sulphites by alkali fusion.

Hydroaromatic Sulphonic Acids—Camphor yields a characteristic sulphonic acid on sulphonation with sulphuric acid in acetic anhydride The optically active camphor sulphonic acids from dextro- and laevo-modifications of camphor have been very useful in the resolution of racemoid bases (*See* STEREOCHEMISTRY.)

(G. T M)

SULPHUR, a non-metallic chemical element, also called "brimstone," has been known from remote times, and, owing to its inflammability, was regarded by the alchemists as the principle of combustion Sulphur (symbol S, atomic number 16, atomic weight 32·064), is widely and abundantly distributed in nature, both in the free state and in combination. Various forms of free or native sulphur occur in volcanic areas, but they are all related to rhombic sulphur, the monoclinic form being unknown in a natural state The crystals (*see* fig) are of hardness 1–2, and sp gr 1·9–2·1; they are transparent or translucent; highly refractive with strong birefringence, and have a characteristic lustre. Although pure sulphur is yellow, impurities such as selenium or arsenic sulphide give it a reddish tint.

Volcanic sulphur usually occurs as a sublimate on the walls of vents, probably as the result of action between hydrogen sulphide and sulphur dioxide Natural sulphureous waters, especially if hot, readily deposit sulphur owing to atmospheric oxidation of the sulphuretted hydrogen Free sulphur may also result from the weathering of pyrites, as in pyritic shales or lignites or from the pyrites of Rio Tinto (Spain). Atmospheric oxidation may affect sulphur itself, producing sulphuric acid, which in the presence of lime produces gypsum, and outcrops of sulphur in Sicily are often covered with this. Important deposits of sulphur in the world occur in Sicily in Miocene marls and limestone, in Transcaucasia and in the Transcaspian steppes, in Japan, Chile, Peru and in many States of the U.S A, especially in Louisiana. Sulphur is also found occasionally in Carrara marble in Calabria, and in carboniferous limestone in Galway.



RHOMBIC SULPHUR CRYSTAL, SHOWING PYRAMIDAL HABIT

In combination, the element occurs chiefly in sulphides and sulphates of metals. The former are of great importance and value, *e g*, copper pyrites, galena (lead), zinc blende, cinnabar (mercury). The sulphates include those of calcium (gypsum and anhydrite), barium (barytes), and magnesium (kieserite) Gaseous compounds occur in volcanic exhalations and in mineral waters The element is also present in hair, wool, albumen (*q v.*) and in certain vegetable oils, such as those of garlic and mustard.

Extraction.—As quarried or mined, free sulphur is always contaminated with clay, limestone, gypsum, etc, and its extraction depends on melting it and running it off from the earthy residue (liquation). In Sicily the method formerly employed was wasteful, but has been improved; a mass of the ore is placed in a kiln and is melted either by setting fire to a portion or by external heating; the molten sulphur is run off into moulds of damp wood, but still contains a certain proportion of impurities Further purification is effected by distillation from large iron pots, the sulphur condensing in a stone chamber either as solid *flowers of sulphur* or as a liquid which is cast into sticks and sold as *roll sulphur*

In Louisiana, the deposits are covered by quicksand and cannot be mined by ordinary methods The Frasch process was specially devised for this purpose: four concentric pipes, of diameters 10, 6, 3 and 1 inch, are sunk in a bore hole, and superheated steam is forced down the 3-inch pipe to melt the sulphur Compressed air is driven down the centre pipe and causes the mixture of water and molten sulphur to rise in the outer pipes, this mixture is run off into settling tanks and yields sulphur of 98% purity

Sulphur is also obtained from pyrites either by distilling it in iron or fire-clay tubular retorts, whereby one-third of the sulphur is obtained in the distillate ($3FeS_2 = Fe_3S_4 + 2S$), or by a modification of the Sicilian process Sulphur from pyrites, however, usually contains traces of arsenic.

Milk of sulphur is produced by boiling sulphur with a suspension of lime until it has dissolved—5 parts of sulphur require about 2 parts of quicklime—and the solution is clarified, diluted, and nearly neutralised by pure dilute hydrochloric acid; this decomposes the calcium polysulphides, giving a very fine, almost white powder, which is washed and carefully dried. If too much acid is added, the calcium thiosulphate, which is formed together with the polysulphides, is also decomposed, and this gives a yellow, coarser product.

Physical Properties.—Commercial sulphur melts at 113° C if quickly heated and boils at 444·53° C under atmospheric pressure. The orange-yellow vapour darkens with increase of temperature, being deep red at 500°, but above that it becomes lighter again and is straw-yellow at 650°. At 200° (under reduced pressure) the vapour density corresponds to S_8 molecules; at 500° to S_6, at about 1,000° to S_2 and at about 2,000° the molecules are completely dissociated to atoms. In carbon disulphide solution sulphur exists as S_8, as shown by boiling-point and freezing-point determinations. Sulphur is a bad conductor of electricity and becomes negatively electrified by friction. It is insoluble in water, it ignites in air at 363° and in oxygen at 280°, burning with a characteristic blue flame and forming sulphur dioxide, a gas with a choking smell, and traces of the trioxide Sulphur also combines directly with most elements to form sulphides.

Allotropic Modifications.—Sulphur can assume a number of

forms differing in external appearance, *e.g.*, crystal structure, and in physical properties, *e.g.*, density. Of these the two most important are rhombic (α, S_α, or S_I) and monoclinic (β, S_β, or S_{II}), since they provided the first instances of what E. Mitscherlich (1822) termed "polymorphism," but is now called "allotropy" (*q.v.*). Rhombic sulphur is readily obtained by allowing a solution of sulphur in carbon disulphide to crystallise. The monoclinic variety is formed as fine needles on the inside of the crust on molten sulphur which has been allowed to cool slightly. Both these varieties are soluble in carbon disulphide and sulphur chloride; above 96° S_α is more or less rapidly converted into S_β, whereas below 96° S_β changes gradually to S_α. If S_α is heated quickly it melts at 114° before it has had time to change into S_β, but if it is heated slowly the change is completed and the S_β formed then melts at 119°. The density of S_α is 2·07 and that of S_β 1·96. Under higher pressures the two forms can only co-exist at a definite temperature for any particular pressure (*i.e.*, the transition point is raised), and if the pressure is raised while the temperature is kept constant the rhombic form is produced, since it is the denser. This balanced state of affairs continues up to 151° and 1,288 atmospheres, above which the monoclinic form cannot exist at all.

The fact that, by rapid heating, the rhombic variety persists up to 114° (under ordinary pressure) without changing into the monoclinic is due to this change being slow and not instantaneous.

Although the foregoing account covers the more obvious phenomena, the relationships are, in fact, extremely complicated, and at least three varieties of sulphur (called S_λ, S_π, and S_μ) are involved. The first, S_λ, is almost certainly S_8, and constitutes the greater part of both the rhombic and monoclinic varieties, but the other two (possibly S_6, S_4, or S_2) form solid solutions with S_λ, and all three are involved in very complex equilibria in both the liquid and the solids. Owing to the slowness with which these equilibria are established, the physical conditions may be somewhat indefinite; thus pure S_λ is calculated to have an "ideal" freezing point of 119°, but the presence of S_π and S_μ depresses this to a varying extent (but never below 114°) according to the rate of cooling, *i.e.*, according to whether the time has sufficed for them to attain their equilibrium values.

Other forms differing in external appearance are the nacreous (or pearly) variety (S_{III}), formed when solutions of sodium thiosulphate and potassium bisulphate interact, or when hydrogen disulphide is shaken with alcohol or ether, and a tabular variety (S_{IV}), formed in the aerial oxidation of alcoholic solutions of ammonium polysulphides. Both these are monosymmetric but have different angles from S_{II}; they change rapidly to S_I at the ordinary temperature, or to S_{II} above 96°, but S_{III} may be melted at 107° if rapidly heated.

Engel's variety (S_ρ) is obtained by mixing sodium thiosulphate solution with hydrochloric acid, filtering, extracting the filtrate with chloroform, and evaporating the extract. It appears to be S_6, but its connection with the other forms has not been established. It is intermediate in colour between S_λ and S_π (*i.e.*, S_8 and S_4) and slowly changes into a mixture of these.

Apart from varieties possessing obvious external differences, more subtle differences have been detected. When sulphur melts the liquid is pale yellow, but on further heating it darkens, and at 160° C it rapidly becomes more viscous. At 180° the liquid is dark red and the viscosity attains a maximum. This behaviour has been traced to the existence of three different types of molecules in the liquid—S_λ, S_π and S_μ; if the molten liquid is poured into water, one obtains clear and elastic strings of *plastic* sulphur. From 5 to 20% of this (depending upon the temperature and time of heating of the liquid) is found to be insoluble in carbon disulphide and is S_μ and the rest is a mixture of S_λ and S_π. The material becomes opaque and brittle after a few days owing to the conversion of most of the S_μ and some of the S_π into crystalline S_λ or rhombic sulphur; the proportion of S_π and S_λ can be ascertained by taking advantage of the fact that at −80° C the latter becomes insoluble in carbon disulphide whereas the former is still soluble. The proportion of S_π in sulphur increases to about 6% at 200° from about 3·5% at 120°, and it has been shown to be tetratomic, *i.e.*, S_4. Owing to its insolubility, the molecular weight of S_μ has not been determined; it is the chief constituent of the so-called amorphous sulphur (S_γ) and of milk of sulphur, and because of its increasing production at higher temperatures it occurs in greater proportion in sulphur which has been rapidly condensed, as in flowers of sulphur.

Many of the above transformations are slow and afford instances of "dynamic" allotropy. (*See* ALLOTROPY.)

COMPOUNDS

Hydrogen sulphide or sulphuretted hydrogen results when hydrogen is passed over molten sulphur at 200°–350° C; at higher temperatures it begins to dissociate into its elements again; it is also formed when acids act on metallic sulphides, ferrous sulphide and dilute hydrochloric or sulphuric acid being most frequently used, but in this case the gas is contaminated with hydrogen. The purest hydrogen sulphide is obtained either by warming precipitated antimony sulphide with hydrochloric acid or by dropping water on to aluminium sulphide produced by a thermite process from sulphur and aluminium powder. It results from the putrefaction of organic substances containing sulphur or from the destructive distillation of coal; it is evolved when organic compounds (such as paraffin wax) are heated with sulphur.

Hydrogen sulphide, a colourless, poisonous gas having the odour of rotten eggs, is moderately soluble in water to give a very feebly acidic solution, which gradually deposits sulphur on exposure to the air; it is much more soluble in alcohol. It burns with a pale blue flame to give sulphur dioxide and water. The gas may be liquefied at 18° C by a pressure of 17 atmospheres, and the liquid boils at 61·8° under ordinary pressure, and solidifies at −83°. It is decomposed by the halogens or by sulphuric acid with the liberation of sulphur. It reacts with many metals to form sulphides, which are also produced by its action on aqueous solutions of metallic salts; the latter reaction is extensively utilised in chemical analysis. Hydrogen sulphide is also used as a reducing agent: in acid solution it reduces ferric to ferrous salts, chromates to chromium salts, and manganates to manganese salts; in alkaline solution it reduces many organic nitro-compounds to the corresponding amino-derivatives. It is rapidly attacked by oxidising agents, yielding primarily sulphur and water.

When metallic polysulphides are acted upon by hydrochloric acid they give a mixture of hydrogen polysulphides, and by fractional distillation under reduced pressure two of these have been separated as oils, viz., the *disulphide*, H_2S_2, b.p. 74°C, and the *trisulphide*, H_2S_3, b.p. 69°/2 mm. They are readily decomposed by the action of light or of water.

Halogen Compounds.—*Sulphur hexafluoride*, SF_6, formed by the action of fluorine on sulphur, is a tasteless, colourless and odourless gas, which may be condensed to a solid melting at −55° C; it is remarkably stable, being unaffected even by fused caustic alkalis, and is of considerable theoretical interest.

Sulphur chloride, S_2Cl_2, occurs as a by-product in the manufacture of carbon tetrachloride from carbon disulphide and chlorine, and may readily be prepared by passing chlorine over molten sulphur and condensing the issuing gas. It is an amber-coloured, fuming liquid with a very irritating smell; it boils at 139° and freezes at −80°. It is slowly decomposed by water to sulphur and a mixture of sulphur acids. Its chief use is in the vulcanisation of rubber, since it dissolves sulphur very readily.

Sulphur dichloride, SCl_2, had its entity definitely established by T. M. Lowry, L. P. McHatton, and G. G. Jones in 1927, before which it was frequently said to be a mixture of the mono- and tetra-chlorides. Chlorine reacts very slowly with the monochloride, but in the presence of a trace of iodine reaction becomes rapid, and by taking advantage of this discovery (among others), these authors were able to show that both SCl_2 and S_3Cl_4 exist; the former, however, becomes unstable just about its melting point (−83°) and gives SCl_4 and lower chlorides; S_3Cl_4 has a narrow range of existence but melts at −103°.

Sulphur tetrachloride, SCl_4, is formed by saturating S_2Cl_2 with chlorine at −22°; it is a yellowish-brown liquid, solidifying to a crystalline mass at −30° C, and dissociating rapidly above

$-20°$. It is violently decomposed by water: $SCl_4+3H_2O=H_2SO_3+4HCl$.

Sulphur bromide, S_2Br_2, is a dark red liquid boiling at 56° under 0·2 mm. pressure and decomposing at about 200°. Sulphur forms no definite compound with iodine.

Oxides.—*Sulphur dioxide*, SO_2, occurs in gaseous exhalations of volcanoes and in solution in some volcanic springs It is formed when sulphur burns in air or oxygen, when metallic sulphides are roasted, and when sulphuric acid is reduced by being heated with carbon, sulphur, or certain metals:

$$C+H_2SO_4=2SO_2+CO_2+2H_2O;$$
$$S+2H_2SO_4=3SO_2+2H_2O;\ Cu+2H_2SO_4=SO_2+CuSO_4+2H_2O.$$

It is also a product of decomposition of many sulphur acids by dilute mineral acids. It is a colourless, incombustible gas with a suffocating odour; it dissolves readily in alcohol or water, the solution in the latter possessing acidic properties. The gas can be liquefied at $-8°$ C and solidified at $-73°$ C; the liquid is a good solvent for certain salts, giving definite compounds in some cases—*e.g.*, $KI,2SO_2$ and $KI,4SO_2$. It combines directly with chlorine (especially in the presence of camphor) to give sulphuryl chloride, and with many peroxides to give sulphates. In the presence of water it acts as a bleaching agent owing to its reducing properties, and these are also manifested in acid solution by the reduction of the manganates to manganese salts and of iodates or iodine to iodides· $2KIO_3+5SO_2+4H_2O=I_2+2KHSO_4+3H_2SO_4$, followed by $I_2+2H_2O+SO_2=H_2SO_4+2HI$. Owing to its reduction of chlorine, it is used as an "antichlor " It is prepared industrially for the manufacture of sulphuric acid (*q.v*), for use as a bleaching agent and disinfectant, and for use in refrigerating machines.

The solution of sulphur dioxide in water is called sulphurous acid, but the acid (probably H_2SO_3) cannot be isolated because the solutions lose sulphur dioxide on concentration. A hydrate, $SO_2,7H_2O$ can be obtained on cooling, but it is unstable above 7°. The salts of the acid are termed bisulphites or sulphites according as one or two of the hydrogen atoms are replaced by metals. The sulphites of the alkali metals, *e.g.*, Na_2SO_3, are soluble in water and give an alkaline reaction; the other sulphites are more or less insoluble; the bisulphites are either neutral or feebly acidic in solution, and as solids they probably exist as *metabisulphites* ($Na_2S_2O_5+H_2O\rightleftharpoons2NaHSO_3$). The sulphites are formed by the action of sulphur dioxide on oxides, hydroxides or carbonates, whereas excess of the gas produces the bisulphites. The acid is probably an equilibrium mixture of two tautomeric forms $O{:}S(OH)_2$ and $O_2S(OH)H$, and a study of the organic derivatives of the salts suggests that they are chiefly of the second (unsymmetrical) type.

Thionyl fluoride, SOF_2, is obtained by decomposing arsenic fluoride with thionyl chloride; it is readily decomposed by water into hydrofluoric and sulphurous acids. *Thionyl chloride*, $SOCl_2$, results from the action of phosphorus pentachloride on sodium sulphite, or of chlorine monoxide on sulphur at low temperatures; it is a colourless, highly refractive liquid, boiling at 78°, and fumes in moist air giving hydrochloric and sulphurous acids: $SOCl_2+2H_2O=H_2SO_3+2HCl$. Thionyl chloride is manufactured by adding sulphur trioxide to sulphur chloride at 75–80° C, sulphur is eliminated and the other volatile product is sulphur dioxide: $SO_3+S_2Cl_2=SOCl_2+SO_2+S$ The process is rendered continuous by passing in chlorine to reconvert the sulphur into chloride.

Sulphur trioxide is obtainable from the distillation of concentrated sulphuric acid with phosphoric oxide, but is chiefly prepared by the direct union of oxygen and sulphur dioxide in presence of a catalyst, such as platinised asbestos. (*See* SULPHURIC ACID.) It exists in two forms; the α-form results from the condensation of the vapour and melts at 17° and boils at 46°; the β-form either melts or undergoes transformation at a higher temperature (about 50°), and has an asbestos-like appearance (A. Smits, 1926, 1927). They are probably SO_3 and S_2O_6, respectively (G. Oddo, 1927) The trioxide combines violently with water to give sulphuric acid and with concentrated sulphuric acid to give pyrosulphuric acid. It is applied either directly or as the latter acid in the dye industry. It frequently chars organic matter.

Sulphuryl fluoride, SO_2F_2, formed by the direct union of the dioxide with fluorine, is an extremely stable colourless gas solidifying at $-120°$. *Sulphuryl chloride*, SO_2Cl_2, is obtained as described under sulphur dioxide, or by heating chlorosulphuric acid in the presence of a catalyst (*e g.*, mercuric sulphate): $2SO_2Cl{\cdot}OH=SO_2Cl_2+H_2SO_4$; it is a colourless fuming liquid, boiling at 69° C and decomposing readily with water: $SO_2Cl_2+2H_2O=2HCl+H_2SO_4$.

Fluorosulphuric acid, $SO_2F{\cdot}OH$, from cooled sulphur trioxide and excess of hydrofluoric acid, or by distilling calcium fluoride with sulphuric acid, boils at 162° and is comparatively stable; it is slowly decomposed by water, an equilibrium being set up. $HFSO_3+H_2O\rightleftharpoons H_2SO_4+HF$. *Chlorosulphonic acid*, $SO_2Cl{\cdot}OH$, is formed by the direct union of hydrogen chloride and sulphur trioxide or by distilling sulphuric acid with phosphoryl chloride: $2H_2SO_4+POCl_3=HCl+HPO_3+2Cl{\cdot}SO_3H$; it is a colourless, fuming liquid, boiling at 155°, and is violently decomposed by water; it was used to provide smoke screens in naval warfare. *Pyrosulphuryl chloride*, $S_2O_5Cl_2$, is obtained by the action of sulphur trioxide on phosphoryl or sulphuryl chloride or on dry sodium chloride, or by distilling chlorosulphonic acid and phosphorus pentachloride; it is a colourless, oily, fuming liquid boiling at 153° and is readily decomposed by water:

$$S_2O_5Cl_2+3H_2O=2H_2SO_4+2HCl$$

Sulphur sesquioxide, S_2O_3, formed as blue drops on adding dry flowers of sulphur to the cooled molten trioxide, sets to blue-green crystals and is rapidly decomposed by warmth. It is decomposed by water but not to hyposulphurous acid, H_2S_2O.

Persulphuric anhydride, S_2O_7, a thick, viscous liquid solidifying to long needles at 0° C, is formed by the action of the silent discharge on a mixture of oxygen and the trioxide, or by the action of ozone on the trioxide.

Sulphur Acids.—Apart from sulphurous acid (*see* above) and sulphuric acid (*q v*) many other acids are known

Hyposulphurous or *hydrosulphurous acid*, $H_2S_2O_4$, has not been isolated, since its solutions are very unstable. The sodium salt is obtained (P. Schutzenberger, 1869) by dissolving zinc in a concentrated solution of sodium bisulphite: $Zn+4NaHSO_3=Na_2S_2O_4+ZnSO_3+Na_2SO_3+2H_2O$; the sulphites separate as a less soluble double salt and the hydrosulphite is crystallised from the solution. The pure zinc salt is obtained by the action of the metal on a solution of sulphur dioxide in absolute alcohol, and the sodium salt can be obtained by passing sulphur dioxide over sodium hydride. The "sodium hyposulphite" of photography is strictly a thiosulphate. Sulphoxylic acid, H_2SO_2, is unknown, but an important derivative, sodium formaldehyde-sulphoxylate (known as "rongalite"), is obtained from formaldehyde and sodium bisulphite: there are two products of the reaction, and fractional crystallisation from alcohol separates the formaldehyde-bisulphite compound, $CH_2O{\cdot}NaHSO_3$ from the formaldehyde-sulphoxylate, $NaHSO_2{\cdot}CH_2O{\cdot}2H_2O$. Both rongalite and sodium hydrosulphite are extensively employed as powerful reducing agents The composition of the latter was for long a matter of dispute but was settled by C. Bernthsen in 1881. The mono-zinc salt of hydrosulphurous acid is used under the name "decrolin."

Permono- and *perdi-sulphuric acids*, H_2SO_5 and $H_2S_2O_8$, result from the electrolysis of solutions of sulphuric acid or bisulphates and by the action of hydrogen peroxide on concentrated sulphuric acid. They have been isolated in a state of purity by the action of the theoretical amounts of chlorosulphonic acid on hydrogen peroxide, the hydrogen chloride formed being pumped off under reduced pressure:

$$H_2O_2+HSO_3Cl=HCl+H_2SO_5;\ H_2O_2+2HSO_3Cl=2HCl+H_2S_2O_8.$$

The mono-acid melts at 45° and the di-acid at 65°. Potassium persulphate, $K_2S_2O_8$, was first obtained in 1891 by H. Marshall by electrolysing solutions of potassium bisulphate, and the existence of the permonosulphate was detected by Caro (1898) in solutions of the perdisulphate which had become partially hydrolysed: $K_2S_2O_8+H_2O=KHSO_5+KHSO_4$. In the electrolysis, it is necessary to secure overvoltage (*e.g.*, by use of a smooth platinum electrode), to have high anode potential and high current density, to cool the anode solution, and to separate

the anode (by the use of a divided cell) so that the per-acids formed by anodic oxidation shall not be reduced at the cathode. Potassium and ammonium salts are more suitable than sodium salts, and ammonium persulphate, being less soluble than the potassium salt, is more easily crystallised. The yields of the per-acids depend largely on conditions: if sulphuric acid is used, that of sp.gr. 1·42 gives a maximum yield of the perdi-acid, and weaker or stronger solutions favour the permono-acid.

Solutions of both free acids slowly decompose to hydrogen peroxide and thence to oxygen on standing. Concentrated sulphuric acid "hydrolyses" the di-acid to the mono-acid: $H_2S_2O_8+H_2O=H_2SO_5+H_2SO_4$, but dilute acid is almost without effect. Caro's acid, on the other hand, is fairly stable in concentrated sulphuric acid and an equilibrium is set up, which shows that the acid may be formed from hydrogen peroxide and sulphuric acid: $H_2SO_5+H_2O \rightleftharpoons H_2O_2+H_2SO_4$. The constitutions of the acids are probably $HO{\cdot}SO_2{\cdot}O{\cdot}OH$ and $HO{\cdot}SO_2{\cdot}O{\cdot}O{\cdot}SO_2{\cdot}OH$. These explain certain differences: (1) Caro's acid is only monobasic, the peroxidic hydrogen atom in $-O{\cdot}OH$ not being acidic, whereas the sulphonic hydrogen atom in $SO_2{\cdot}OH$ is. (2) Caro's acid oxidises aniline to nitrosobenzene, $C_6H_5{\cdot}NH_2 \rightarrow C_6H_5{\cdot}NO$, in virtue of its $O{\cdot}OH$ group, whereas the perdi-acid does not—the action is unique. (3) Caro's acid oxidises solutions of iodides immediately, whereas acid solutions of persulphates act only slowly. Both types of acids oxidise ferrous salts but do not react with permanganates.

Thiosulphuric acid, $H_2S_2O_3$, is unstable in solution, but its salts are perfectly stable, the sodium salt, $Na_2S_2O_3,5H_2O$, being the well-known "hyposulphite" of photography; this is prepared by boiling sulphur with milk of lime, exposing the deep yellow solution of polysulphides to atmospheric oxidation, and converting the resulting calcium thiosulphate to the sodium salt by addition of sodium carbonate or sulphate. Thiosulphates are readily decomposed by mineral acids with liberation of sulphur and sulphur dioxide and formation of other sulphur acids, including trithionic acid. They form many double salts and give with ferric chloride a dark violet coloration which fades on standing. The acid is said to possess the structure $O_2S(SH)(OH)$, but in the absence of definite evidence it is better to formulate it as $\left[\begin{smallmatrix} O & n & O \\ & S & \\ O & & S \end{smallmatrix}\right] H_2$.

The *thionic acids* are a group of general formula $H_2S_nO_6$, where n may be 2, 3, 4, 5, and possibly 6. *Dithionic acid*, $H_2S_2O_6$ is formed by passing sulphur dioxide into an aqueous suspension of freshly precipitated manganese dioxide or, better, ferric hydroxide; addition of barium hydroxide precipitates the barium salt, and if this is treated with dilute sulphuric acid, the resulting solution of dithionic acid can be concentrated to sp.gr. 1·35 but then decomposes (as do its salts when treated with hydrochloric acid) to sulphuric acid and sulphur dioxide. All the salts are more or less soluble in water.

Trithionic acid, $H_2S_3O_6$, may be obtained in the form of its salts by the action of sulphur dioxide on potassium thiosulphate solution, by warming silver potassium thiosulphate solution, or by adding iodine to a mixture of sodium thiosulphate and sulphite (Spring's reaction): $Na_2SO_3+Na_2S_2O_3+I_2=Na_2S_3O_6+2NaI$. The salts and the solutions of the acid are unstable.

Tetrathionic acid, $H_2S_4O_6$, is obtained by the action of dilute sulphuric acid on the barium salt, obtained by digesting barium thiosulphate with iodine—compare the fundamental reaction of iodometric titrations: $2Na_2S_2O_3+I_2=Na_2S_4O_6+2NaI$. The free acid decomposes when its solutions are concentrated.

Wackenroder's Solution.—When hydrogen sulphide is repeatedly passed into a saturated aqueous solution of sulphur dioxide at 0° C, the resulting solution contains colloidal sulphur (also called Sδ, but $S_8{\cdot}H_2O$ according to Spring) and small quantities of all the thionic acids, especially pentathionic acid, $H_2S_5O_6$. The reactions involved are very complex and have been studied *inter alios* by H. Debus (1888), F. Foerster, F. Raschig, A. Kurtenacher, and H. Bassett and R. G. Durrant (1927), but in every case it has been found necessary to postulate the existence of one or more hypothetical compounds, such as SO, S_5O_5, $S_{10}O_{10}$, $H_2S_2O_2$, etc., for which there is only indirect evidence. The views of Bassett and Durrant may be summarised. (1) Sulphur dioxide reacts in the form of the hypothetical pyrosulphurous acid giving sulphoxylic acid and pyrosulphoxylic acid (both of these are hypothetical, and the latter is distinct from thiosulphuric acid): $H_2S+H_2S_2O_5 \rightarrow S(OH)_2+HO{\cdot}S{\cdot}O{\cdot}S{\cdot}OH$. (2) Hydrolysis of pyrosulphoxylic acid gives more sulphoxylic acid: $H_2S_2O_3+H_2O \rightarrow 2H_2SO_2$. (3) Sulphoxylic acid and hydrogen sulphide then react: $H_2SO_2+H_2S \rightarrow 2S+2H_2O$. (4) The finely divided sulphur thus formed is very reactive and rapidly gives thiosulphuric acid with sulphurous acid ($S+H_2SO_3=H_2S_2O_3$) which, in the dilute feebly acidic solution, is sufficiently stable to have a temporary existence. (5) Thiosulphuric acid decomposes to give trithionic acid: $2H_2S_2O_3 \rightarrow H_2S+H_2S_3O_6$. (6) This acid reacts with (*a*) finely divided sulphur or (*b*) thiosulphuric acid to give tetra- and pentathionic acids: (*a*) $H_2S_3O_6 \rightarrow H_2S_4O_6 \rightarrow H_2S_5O_6$; (*b*) $H_2S_3O_6+H_2S_2O_3 \rightarrow H_2S_4O_6+H_2SO_3$ and $H_2S_4O_6+H_2S_2O_3=H_2S_5O_6+H_2SO_3$. Trithionic acid is thus the first of the thionic acids to be formed, and pentathionic acid is a later product.

Pharmacology and Therapeutics.—The sulphur preparations mentioned in the British Pharmacopoeia are: (1) *Sulphur sublimatum*, flowers of sulphur, from which are made (*a*) *confectio sulphuris*, a mixture with potassium bitartrate, and (*b*) *unguentum sulphuris*. (2) *Sulphur praecititatum*, milk of sulphur, used with potassium bitartrate in the lozenge *trochiscus sulphuris*. (3) *Potassa sulphurata*, liver of sulphur, chiefly sulphides of potassium. (4) *Calx sulphurata*, sulphurated lime, mostly calcium sulphide, a greyish powder obtained when calcium sulphate and carbon are heated together. *Sulphuris iodidum* forms the basis of an ointment in the U.S.P.

Sulphur as an ointment is used in skin affections such as scabies (itch) or acne, but "sulphurated lime" is more efficient in the latter case and in the treatment of boils. Internally, it is a mild laxative, being used as milk of sulphur. Sulphur and sulphurous waters (as at Harrogate, Aix-la-Chapelle, and Aix-les-Bains) are effective for congested conditions of the liver and intestines, haemorrhoids, gout and gravel. Its ability to rid the lungs of mucus, is utilised in chronic bronchial affections. In chronic rheumatism sulphur waters are effectual both internally and as baths.

The sulphur dioxide produced by burning sulphur is a powerful disinfectant and is used for fumigating rooms which have been occupied by persons suffering from infectious diseases.

The use of sulphur dioxide or sulphites as a preservative in foods is to be deprecated and is illegal in many countries. Owing to the ancient French custom of fumigating wine-casks by burning sulphur in them, a small proportion of sulphur dioxide is allowable in wines, and in Great Britain 450 parts per million parts of wine has been fixed as a legal limit. (A. D. M.)

SULPHUR, SPECIAL APPLICATIONS OF. Sulphur is a convenient source of sulphur dioxide gas, which is the basis for the manufacture of sulphuric acid and sulphite pulp. In a number of industries sulphur plays an essential part and has no substitute. This is the case in the vulcanization of rubber, and for many agricultural and horticultural purposes, such as insecticides and fungicides, and for the making of lime-sulphur solutions. Among the properties of sulphur are fusibility, acid resistance, a number of physical forms, extremely low electrical conductivity and general chemical resistance. There are few solvents for sulphur and it is not acted upon by water, but for certain purposes its inflammability is detrimental.

As an Impregnant.—All forms of pulp and paper products can be impregnated with molten sulphur and the more absorbent types take up three or four times their dry weight. Pre-formed pulp and paper articles, when impregnated with sulphur become very strong, weather-resistant and converted into much denser and harder materials. Among the applications of such paper products are flat fibre boards so treated as to prevent warping and make them resistant to acid and other destructive agencies. Spool-heads, advertising signs and many other articles of paper, fibre or pulp can be hardened and weather-proofed by means of sulphur impregnation.

Practically all species of wood may be impregnated with molten sulphur under proper conditions, the more resistant species requiring the application of vacuum and pressure. The general

procedure is very similar to that so widely used for the creosoting of wood, but the effect is quite different With sulphur there is very little change in colour, but a marked increase in weight and a phenomenal hardening and strengthening effect. Pieces of soft wood with a high sulphur content appear almost as though petrified. It converts a soft wood into a very hard and durable product, comparing favourably with the heaviest and densest tropical woods. By the addition of various sulphur soluble dyes, attractive colours are imparted. Wood so treated is much less absorbent to moisture and withstands the action of acid and other destructive agencies. Tests made on wood structures in contact with the ground indicate that sulphur acts as a preservative even though not in itself particularly toxic. Its toxicity toward wood-rot fungi may be increased by the addition of certain substances that are recognized preservatives and which have been found to be miscible with molten sulphur The applications for sulphur-treated wood are numerous and include floor blocks, especially where acids are used, fence posts, railway ties, etc Stone and concrete are likewise subject to sulphur impregnation

Textiles and fabrics may likewise be impregnated with sulphur and have the advantage of being readily formed or shaped before processing. Fabric coverings saturated with molten sulphur may be spirally wound on metal pipes or other objects in order to produce extremely dense, impervious coverings These were under test in 1928 for the prevention of underground corrosion.

Sulphur Introfiers.—The term "introfier" has been applied to certain organic substances having a most peculiar effect on the penetrance of molten sulphur They may be used to advantage in practically all the examples of sulphur impregnation heretofore described and are also valued in making certain sulphur compositions Some of the substances which not only increase the rate but the ultimate limit of penetrance of molten sulphur are napthalene, its chlorinated and hydrogenated derivatives, anthracene, triphenyl phosphate and other compounds

Other Special Uses.—In view of the fact that one of the problems of the steel industry is the removal of sulphur, it is interesting to note that it is deliberately added to steel for special purposes, notably for the making of screw stock Likewise, in petroleum, refining sulphur-compounds present in many crude oils must be removed to make them fit for refining. But for some uses an oil containing sulphur is desirable This is the case with metal-cutting oils, used largely by the metal-working industries for thread cutting, turret lathes and other machine work Sulphur is incorporated with an animal or vegetable oil base and subsequently added in proper proportion to a petroleum oil

Sulphur cements which are applied hot, consist of sulphur with various inert mineral fillers and are useful for anchoring metal in stone, such as bolts in engine foundations, iron railings and the securing of chains to granite blocks for buoys, setting electrical insulator pins, doorknobs and a great many other purposes. They are particularly useful for pointing up acid proof brick in order to protect lime mortar, cementing floor blocks in acid-pickling rooms, the pouring of pipe joints both water and acid, and for setting bushings in abrasive wheels

Other uses for sulphur are the manufacture of sulphur colours, as a preservative for dried fruits and, in the form of tapers, for locating ammonia leaks and sulphuring wine casks In colloidal form, sulphur is valuable as an intravenous injection for the treatment of certain diseases, and as a recognized curative agent in dermatology, especially for scabies, ringworm, acne, favus, prurigo and psoriasis The boiling point of sulphur, 444 6° C is used in thermometry for scale determination, while molten sulphur is an excellent heating medium. Synthetic resins result from the interaction of sulphur or sulphur chloride with phenol, and it imparts the dark amber colour to glass bottles Sulphur is used in making sheep and cattle dips, while it is admixed with the salt given to stock It is also used for the stoving of wool, and the sulphuring of hops, silks, sponges, feathers and other commodities and is employed for making plaster cast moulds Sulphur compounds are used for the so-called oxidation of silver, bronze and other metals, as well as for the bleaching of brooms, straw, wicker furniture and the tanning of leather

Sulphur in its more complex phases, especially organic, is of industrial as well as biologic interest. Allyl isothiocyanate, a sulphur compound, is found in mustard oil and is responsible for the irritating action of the ordinary mustard plaster. An important derivative dichloroethyl sulphide, was brought into prominence during the World War as mustard gas. Sulphur may be responsible for the efficacy of certain organic compounds used as flotation oils in the recovery of valuable ores This is notably the case with the various xanthates Cellulose xanthate is one of the products in the process of manufacturing artificial silk, or viscose rayon An albuminoid substance known as keratin occurs in practically all animal and human appendages such as hair, hoof, horn, fur, wool, feathers and nails, and since the keratins are very high in cystine, human hair containing about 14%, its importance is readily seen. Various complex organic sulphur compounds play an important part in the human body, and are vital to our welfare and probably to life itself. (W. H K)

SULPHURIC ACID, oil of vitriol, H_2SO_4, is commercially of the greatest importance The urgency of the market demand for this acid is recognized as one of the most accurate and sensitive indications of the general state of the trade.

Pure sulphuric acid is an oily, colourless, heavy liquid (sp gr. 1·85), freezing at 10 8° C and boiling with partial decomposition at 338° C It is highly corrosive, charring many organic substances, largely owing to its great avidity for water. So much heat is evolved that on mixing with water it is unsafe to add water to the strong acid, the acid being always poured slowly into water with thorough stirring When the vapour is heated to 450° C it is completely dissociated into water and sulphur trioxide, the latter decomposing into sulphur dioxide and oxygen on further heating The hot concentrated acid is a weak oxidizing agent, converting carbon into carbon dioxide, sulphur into dioxide, and many metals, such as copper, into their sulphates with evolution of sulphur dioxide The cold dilute acid dissolves certain of the more electropositive metals such as zinc and iron with evolution of hydrogen Sulphuric acid is dibasic, giving rise to two series of salts, acid and normal Most sulphates are readily soluble in water, the commonest exceptions being those of calcium, strontium, barium and lead Its efficacy in many common chemical processes depends on its power of liberating other acids from their compounds, not because it is necessarily stronger (*see* CHEMICAL ACTION), but because it is less volatile Its value in organic chemistry depends partly on its great affinity for water, whence its use in nitration processes (*see* DYES, SYNTHETIC; and EXPLOSIVES), and partly on its power of forming sulphonic acids with many aromatic compounds (*see* CARBOLIC ACID, INDIGO, and NAPHTHALENE).

Manufacture.—Sulphuric acid has been known for many centuries, having been originally prepared, probably by Arabian chemists, by condensing the fumes evolved on heating the naturally occurring sulphates of iron or alumina A method of preparation by burning sulphur with saltpetre was described by Basil Valentine in the 15th century. Lead chambers for carrying out this reaction were introduced by Roebuck of Birmingham in 1746 It was first manufactured on a commercial scale in Bohemia and at Nordhausen in Germany by heating weathered pyritic shales, a method adopted from the practice of the early alchemists This acid fumed strongly in the air, whence its old name of "fuming" or Nordhausen sulphuric acid A great extension arose from Liebig's discovery in 1840 of a method of rendering the phosphorus content of mineral phosphates available in soluble form for plant growth by treatment with sulphuric acid, this process affording the greatest outlet for this acid Subsequently, a more highly concentrated form of acid became essential to the manufacture of dyes and the refining of oil, and the "contact" process was developed to meet this requirement

The original raw material was brimstone from Sicily, but by the middle of the 19th century this source had been largely replaced by iron pyrites which occurs abundantly in many countries, for example, in North Wales and County Wicklow, Ireland; but after the introduction of the wet process for copper extraction the pyrites most generally used in Great Britain and the eastern

States of America was the copper-containing variety found in immense quantities in South-Western Spain where it is mined by the Rio Tinto, Tharsis and other companies. In recent years, however, the enormous production of brimstone (*see* SULPHUR) in the United States by the "Frasch" process coupled with changed economic conditions in copper extraction has led to renewed use of brimstone. Spent oxide from the purification of coal gas and zinc blende or "concentrates" from the Australian lead-zinc ores are sulphur-containing materials which furnish sulphur dioxide in appropriate furnaces. Large quantities of acid are produced in America from the waste gases from copper smelters, and during the World War a promising process was developed in Germany whereby sulphur dioxide is produced from naturally-occurring calcium sulphate, gypsum or anhydrite by calcining with clay in a rotary kiln, yielding cement as a by-product. Brimstone and spent oxide contain free sulphur, whereas in pyrites and blende the sulphur is present as sulphides of iron and zinc respectively; nevertheless, the latter materials will burn in air without extraneous heat, although with blende it is necessary to use fuel in the finishing stages in order to assist in its complete desulphurization.

Whatever the nature of the raw material the resulting burner gas should preferably contain 7–8% (by volume) of sulphur dioxide with 9–9½% of oxygen, the remainder being inert nitrogen. Actually it is easy to get as much as 10 or 11% of sulphur dioxide in the gas obtained by burning brimstone and still leave an adequate excess of oxygen for the next stage. With blende it is difficult to maintain more than 6% of dioxide; in the case of this material and of pyrites some atmospheric oxygen combines with the zinc or iron originally associated with the sulphur, while in the case of spent oxide an appreciable amount is consumed by the carbonaceous matter. Burner gas from brimstone is the purest; that from pyrites always contains arsenic, lead, selenium and other impurities originally present in the ore; that from blende has only a small amount of arsenic but often contains a little fluorine; whilst that from spent oxide, though containing little more arsenic than the gas from brimstone, always includes in addition to harmless carbon dioxide a certain amount of tarry matter and ammonia which lead to a high consumption of nitrogen compounds in the next stage.

For the large-scale production of sulphuric acid from burner gas there are two processes: (1) the *contact process,* wherein oxidation is brought about directly by passing the burner gas over a suitable catalyst, and (2) the *chamber process,* in which oxidation is brought about by an intermediate reaction with oxides of nitrogen acting as oxygen carriers between air and sulphur dioxide. The disadvantages of the latter process are that it is impossible to produce high-strength acid directly, and also that unless pure brimstone is used the impurities (*e.g.,* arsenic) originally contained in the raw material are found in the finished acid. Further, except for certain modern modifications, the plant has the disadvantage of occupying a large ground space in proportion to output, but it has the great advantage of high efficiency, the yield regularly exceeding 98% of the sulphur in the burner gas; it is also controlled with very little labour. The contact process, on the other hand, will give directly acid of any required strength up to about 25% oleum. Moreover, in the preliminary purification of burner gas all harmful impurities are removed, so that a pure acid can be obtained directly from such material as arsenical pyrites or blende. The plant is, however, more costly, the labour and power charges heavier and the efficiency lower, so that whereas the Contact type of plant now holds the field almost exclusively for the manufacture of concentrated and fuming acid, the Chamber process can still compete in acid of no more than 80% strength, as required by most consuming trades except oil refining and the manufacture of dyestuffs and explosives.

Contact Process.—Although the reaction is very slow, sulphur dioxide is oxidized appreciably to trioxide by air at atmospheric temperature. At higher temperatures, however, the reaction proceeds more rapidly but is limited by the reverse change. For example, with a 7% burner gas the maximum yields, according to Haber, are 99%, 85%, and 60% at 435°, 550°, and 645° C respectively. Since the reaction is improved by the use of low temperatures, it is beneficial to employ some substance capable of increasing the velocity of the reaction without itself undergoing any change. Such a substance is called a catalyst. (*See* CATALYSIS.) It must be emphasized that a catalyst does not change the final equilibrium between the reacting substances at any given temperature: its function is purely that of an accelerator. For this reaction the various catalysts include metallic platinum and oxides of iron and vanadium, of which the first is much the most widely used. Platinum and vanadium operate effectively at 425–450° C, which is the optimum temperature. Iron oxide becomes effective only at 600° C, so that the maximum yield of SO_3 attainable is only about 70%.

Catalysts are peculiarly susceptible to "poisoning" by impurities commonly present in burner gas. Arsenic and halogens even in minute quantities render a platinum catalyst quite inactive, although the oxides of iron and vanadium are less sensitive. Consequently a preliminary purification of burner gases is essential.

There are many types of contact plant of which the best known are the Badische (using this term to describe processes which were developed in England by Squire and Messel as early as in Germany, while actually the Badische Gesellschaft itself now employs a modification of the process developed in the United States), Grillo, Tentelew and Mannheim. Excepting the Mannheim plant, which employs ferric oxide as preliminary, all these employ platinum as catalyst, and they differ only in the nature of the plant used for scrubbing and purifying the gases and in the carrier employed for the platinum; in the Grillo process the platinum is spread over the surface of calcined magnesium sulphate, whereas in the other processes it is carried on asbestos fibre. All types of contact plant (excepting the Mannheim, where the hot burner gas passes directly up rectangular shafts packed with oxide of iron) consist first of coolers followed by or combined with scrubbing towers in which the gases are washed with cold sulphuric acid, then another wash-tower, round which is circulated very weak sulphuric acid or an alkaline solution to remove traces of halogens (chlorine and fluorine). The washed gases pass through one or two filters which may be large rectangular boxes (as much as 30′ sq. x 12′ in depth) constructed of sheet lead packed with finely graded coke. The cold filtered gases are then dried by passing up another tower, again built of lead and lined with acid-resisting brick, through which pure 95% sulphuric acid is circulated. After filtering through graded coke to stop mechanically carried spray, the gases are passed through a Root's blower which creates a draught throughout the whole apparatus. Where brimstone is burned much of the foregoing plant may be omitted, but only after this complicated purification are the gases permitted to enter the contact chambers, which are cast-iron or steel vessels containing shelves or trays packed with platinised material. The heat generated by the reaction is utilized by tubular heat exchangers to heat the cold incoming gas, so that in a well-designed plant no extraneous heat whatever is required to maintain the correct temperature.

In the latest type of plant two catalyst chambers are used in series together with two heat-exchangers. A remarkable change takes place in the appearance of the gases after passage through the contact chambers; whereas the incoming gas is colourless and invisible with an unpleasant sulphurous smell, the product issues as a dense, white, intensely acid fume of trioxide, practically without odour. After cooling, this fume is always absorbed in 98% sulphuric acid, since it is only very slowly absorbed by water. A portion of this solution is continuously diluted with water and returned to the absorbers. The surplus may be sold as "fuming" acid or *oleum,* or it may be diluted with water to any required strength. The absorption is carried out in steel towers packed with quartz, over which 98% acid is circulated by centrifugal pumps, or alternatively the gases are actually bubbled through the acid in a series of steel vessels. Although lead is generally used in plant construction up to the stage of the contact chambers, nothing but steel or cast iron can be employed in the later stages for lead is very rapidly attacked either by sulphur trioxide or by fuming acid.

Chamber Process.—In this process the oxidation of sulphur dioxide to trioxide is brought about by means of oxides of nitrogen, and the name is still applied generally, although the reaction is frequently brought about in plants differing considerably from the rectangular lead chambers formerly in exclusive use There has been considerable controversy over the nature of the reactions occurring in the chamber process. The simplest theory, that of Berzelius, suggests that nitric oxide, NO, is the essential "carrier" which takes up oxygen from the air to form nitrogen peroxide, NO_2. The latter then gives one of its atoms of oxygen to the sulphur dioxide, converting it into sulphur trioxide, which combines with water forming sulphuric acid. In yielding an atom of oxygen, nitrogen peroxide becomes again reduced to nitric oxide, which repeats the cycle of changes indefinitely except for losses which are inevitable under factory conditions. The foregoing interaction between nitrogen peroxide and sulphur dioxide only takes place in the presence of water. Nitrosyl sulphate, nitrosulphonic acid, or "chamber crystals," postulated by Lunge as an essential intermediate stage of the reaction, may appear under certain conditions in the later stages of the process when the supply of water to the chambers is insufficient.

A chamber plant of normal type includes burners to supply sulphur dioxide, with dust collecting chambers when necessary, followed as closely as possible (in order to avoid heat losses) by a *Glover tower,* which consists of a lead shell lined internally with vitrified brick and surmounted by two lead-lined cisterns Internally the tower is packed with brick chequer work or flints supported on semi-circular arches. Down this tower are fed two qualities of acid—weak acid produced in the chambers at 60–70% strength which is concentrated by the heat of the burner gases (the steam driven off passing on to the chambers), and acid from the Gay Lussac tower at the other end of the process. The latter acid contains dissolved oxides of nitrogen which are expelled by the hot burner gas and returned to the leaden chambers, while the acid reaches the base of the Glover tower concentrated to about 80% H_2SO_4 and practically free from oxides of nitrogen. This acid is then cooled in water-jacketed lead coolers, a portion being returned to the Gay Lussac towers for re-absorption of the nitrogen oxides escaping from the chambers, while the remainder is available for sale.

From the Glover tower the gases pass into the lead chambers which are large rectangular boxes of sheet lead, generally about 25ft. wide, 20 to 30ft high, and up to 140ft in length, and are usually arranged consecutively in sets of at least three The lead sheets are supported in a frame-work of timber or steel, and the leaden joints are made by "burning" or heating the lead at the junction with a blowpipe flame so that it just melts and then resolidifies. Lead of the very highest degree of purity, 99 99%, is to be preferred for this purpose. The chambers are generally erected on columns well above the ground so as to avoid unnecessary pumping of acid. Excepting in the first chamber, to which steam is largely supplied by the evaporation from the Glover tower, it is necessary to supply water to convert the sulphur trioxide produced into sulphuric acid which falls like a shower of rain to the floor of the chambers. This water was formerly supplied in the form of steam, but is now generally sprayed in a finely atomised form. The lead chambers afford sufficient time and space for the alternate cycles of oxidation and reduction to complete themselves until the whole of the sulphur dioxide has been converted into sulphuric acid, and they dissipate the heat evolved in the reaction.

By the time the residual gases leave the last chamber the whole of the sulphur dioxide should have been completely removed as sulphuric acid, whereas practically the whole of the nitrogen oxides should still be present unchanged. These are recovered by passing them up one or more *Gay Lussac towers,* which are similar to the Glover tower but of at least double the capacity, and of lighter lead since at this stage the acid is quite cold. The towers are lined with acid-resisting brick and packed either with coke, earthenware rings or narrow strips of glass with the alternate layers at right angles to one another. It is preferable to have at least two Gay Lussac towers with a fan between them controlling the draught of the whole process. These towers are fed from the Glover tower with cold strong sulphuric acid in which oxides of nitrogen are readily soluble. The nitrous vitriol leaving the first tower is returned to the Glover where its nitrogen oxides are returned to the cycle. To compensate for inevitable loss through incomplete absorption, quite apart from secondary reactions which may lead to destruction of a portion of the nitrogen oxides, it is necessary to replenish these oxides continuously. Formerly this was done by decomposing nitrate of soda with sulphuric acid in cast iron pots heated at the end of the pyrites burners. Alternatively nitric acid is trickled down the Glover tower or a mixture of ammonia gas and air is passed over a hot platinum gauze which catalyses the oxidation of ammonia to oxides of nitrogen. The amount of fresh nitre required should not be more than 2½–3% of the sulphur burned Both in America and on the continent of Europe Glover and Gay Lussac towers have been constructed without any lead casing but simply of acid-resisting brick or volvic lava set in acid-resisting cement

Attempts have been made to do away with chambers altogether, the oxidation of sulphur dioxide taking place largely in the liquid phase by means of the nitrous compounds dissolved in vitriol, as in the Opl plant where the reaction between burner gas and nitrous vitriol takes place in a series of towers, the later ones of which act as absorbers for the nitrogen oxides which are liberated in the earlier ones, the nitrous acid being returned to the first tower. Water is fed down the middle towers to maintain them at the requisite strength for the reaction. Other types of apparatus have been introduced in which, instead of the gas merely coming into contact with films of liquor flowing over tower packings, the acid is bubbled or passed through nitrous vitriol which is simultaneously agitated by revolving drums which fill the vessels with a continuously renewed spray or film of acid. Where non-arsenical acid is required from an acid produced from arsenical pyrites, the impurities are removed by treatment with sulphuretted hydrogen; this precipitates arsenious sulphide and most other impurities, which are then removed by filtration or by oil flotation methods

Concentration.—The concentration of chamber acid is of small commercial importance, because strong acid can be produced more cheaply by the contact process, but concentration is still of value in connection with such manufactures as dyes and explosives where, after nitration with mixed nitric and sulphuric acids, a dilute sulphuric acid remains which must be recovered. An installation suitable for small outputs consists of a number of basins of silicon-iron or fused silica arranged in two or three rows in cascade fashion and heated from below, but where larger quantities of acid are being concentrated, plant of the Kessler or Gaillard type is employed. The *Kessler,* of which there are many modifications, consists of a producer-gas fired, over-heat pan, generally built of volvic lava, inside a heavy lead dish and provided with baffles in the roof so as to cause the fire gases which enter at one end to strike down on the layer of acid which flows in the opposite direction At the other end of the pan is a small packed tower down which the incoming vitriol is fed on its way to the pan. The exit gases are passed through a fine coke-packed scrubber to remove acid mist. These fumes are usually removed by a Cottrell electrical precipitator, lead electrodes being used The *Gaillard tower* consists of an empty tower of 6′ to 9′ internal diameter and 40′ to 50′ high, built of volvic lava or acid-resisting brick, into the top of which weak sulphuric acid is sprayed meeting the hot gases from a coke-fired producer The exit gases from the Gaillard tower are usually passed up a scrubbing tower to remove acid vapour and are then put through a Cottrell precipitator. The Gaillard tower is suitable for dealing with dirty waste acids, but will not produce economically more than 93% vitriol, whereas the Kessler plant furnishes 95–96% vitriol.

Nomenclature.—The ordinary commercial grade of acid made from pyrites by the chamber process at 77–80% strength is known as common or brown oil of vitriol (B.O.V.); similar acid free from arsenic, either as the result of a de-arsenication process, or by preparation from a non-arsenical material such as brimstone, is called best brown oil of vitriol (B.B.O.V). The stronger grade of 93–96% acid is known as rectified vitriol (R.O.V.). Acid of 100% strength, *i.e.,* exactly H_2SO_4, is called "monohydrate";

excess of sulphur trioxide readily dissolves in this, giving rise to still stronger acid known as "fuming" sulphuric acid or "oleum."

The grade of oleum is expressed by stating the percentage of free sulphur trioxide, SO_3, which it contains apart from that combined with water to form H_2SO_4; thus 20% oleum means acid containing 20 parts of SO_3 and 80 parts of H_2SO_4. The usual commercial grades of oleum are 20% and 60–65%, both of which are liquids at ordinary temperatures, while intermediate and higher strengths are solids. More dilute grades of acid are sold for use in electrical storage batteries; these are sold by specific gravity as measured by the hydrometer, the usual strength for batteries for wireless sets and motor cars being 1·215 to 1·250 or 28–33% of sulphuric acid.

Sulphuric acid is generally sold in glass carboys holding 10 gallons, which are protected by straw packing inside an iron frame work or steel drums, but chiefly in steel tank wagons. Acid should not be transported in steel, however, at less than 75% strength. For bulk transportation of weaker acid, lead-lined tanks are used.

Documents of the League of Nations International Economic Conference Geneva (1927) give the output of sulphuric acid in 1925 as follows:—

Metric tons @ 62·5% H_2SO_4

Germany	1,800,000	Denmark	175,000
Gt. Britain	1,300,000	Sweden	140,000
United States	6,300,000	Serbia	100,000
France	1,840,000	Czechoslovakia	210,000
Belgium	740,000	Hungary	80,000
Holland	150,000	Austria	70,000
Poland	320,000	Switzerland	50,000
Spain	230,000	Italy	1,075,000
		Total	14,580,000

The output in Germany in 1913 was 2,700,000 tons. The plant capacity is doubtless much greater than the above figures: in Great Britain, for example, it is above 2,000,000 tons per annum.

SULPHUR SPRINGS, a city of Texas, U.S.A. Pop. (1920) 5,558 (21% negroes), estimated locally at 7,500 in 1928. Lignite is mined near by and natural gas is available.

SULPICIA, the name of two Roman poetesses. The earlier lived in the reign of Augustus, and was a niece of Messalla, the patron of literature. Her verses, which were preserved with those of Tibullus and were for long attributed to him, are elegiac poems addressed to a lover called Cerinthus, possibly the Cornutus addressed by Tibullus in two of his *Elegies* (bk. ii., 2 and 3; *see* Schanz, *Gesch. d. röm. Litt.* § 284; F. Plessis, *La Poésie latine*, pp. 376–377 and references there given). The younger Sulpicia lived during the reign of Domitian. Martial (x. 35, 38), praises her wifely devotion, which was the subject of her poems. An extant poem (70 hexameters) discovered in 1493, and attributed to her, is probably 5th Century, or even later.

Editions by O. Jahn (with Juvenal and Persius, revised by F. Bücheler, 1893) and in E. Bährens, *De Sulpiciae quae vocatur satira* (1873); *see* also Teuffel, *Hist. of Roman Literature* (Eng. trans., 1900), p. 233, 6. There are English translations by L. Evans in Bohn's *Classical Library* (prose, with Juvenal and Persius) and by J. Grainger (verse, 1759).

SULPICIUS RUFUS, PUBLIUS (*c.* 121–88 B.C.), Roman orator and statesman, legate in 89 to Cn. Pompeius Strabo in the Social War, and in 88 tribune of the plebs. Soon afterwards Sulpicius, hitherto an aristocrat, declared in favour of Marius and the popular party. He was deeply in debt, and it seems that Marius had promised him financial assistance in the event of his being appointed to the command in the Mithridatic War. To secure the appointment for Marius, Sulpicius brought in a franchise bill by which the newly enfranchised Italian allies and freedmen would have swamped the old electors (*see* further Rome). The majority of the senate were strongly opposed to the proposals; a *justitium* (cessation of public business) was proclaimed by the consuls, but Marius and Sulpicius got up a riot, and the consuls, in fear of their lives, withdrew the *justitium.* The proposals of Sulpicius became law, and, with the assistance of the new voters, the command was bestowed upon Marius. Sulla, who was then at Nola, immediately marched upon Rome. Marius and Sulpicius, unable to resist him, fled from the city. Marius managed to escape to Africa, but Sulpicius was discovered in a villa at Laurentum and put to death; his head was sent to Sulla and exposed in the forum. Sulpicius appears to have been originally a moderate reformer, who by force of circumstances became one of the leaders of a democratic revolt. Although he had impeached the turbulent tribune C. Norbanus, and resisted the proposal to repeal judicial sentences by popular decree, he did not hesitate to incur the displeasure of the Julian family by opposing the candidature for the consulship of C. Julius Caesar who had never been praetor and was consequently ineligible. His franchise proposals, as far as the Italians were concerned, were a necessary measure of justice; but they had been carried by violence. Of Sulpicius as an orator, Cicero says (*Brutus*, 55): "He was by far the most dignified of all the orators I have heard, and, so to speak, the most tragic; his voice was loud, but at the same time sweet and clear; his gestures were full of grace; his language was rapid and voluble, but not redundant or diffuse; he tried to imitate Crassus, but lacked his charm." Sulpicius left no written speeches, those that bore his name being written by a P. Canutius (or Cannutius). He is one of the interlocutors in Cicero's *De oratore.*

SULTANPUR, a town of British India, on the river Gumti, midway between Benares and Lucknow. Pop. (1921), 8,846. The district has an area of 1,713 sq.m. and in 1921 the population was 1,003,912.

Sumach (Rhus coriaria): from left to right: flower, branch, seed, fruit, cluster of fruit

SUMACH or **SUMAC,** the name given to numerous shrubs and small trees of the botanical genus *Rhus* (family Anacardiaceae,) which comprises about 150 species, natives chiefly of warm regions. They have a milky or resinous juice; simple or compound leaves; small flowers, with the parts in fours or sixes; and small, dry, one-seeded, often hairy, sometimes highly-coloured fruits, usually in dense clusters.

The name sumach is given also to the commercial preparation of the dried and ground leaves of the Sicilian or tanners' sumach

(*R. Coriaria*) of southern Europe, long used in making leather.

In North America the sumachs are represented by about 15 species. Several have poisonous foliage, as the poison-ivy (*q v.*); the non-poisonous sumachs include some of the most attractive American shrubs Among those found in the eastern States and Canada are the handsome staghorn sumach (*R. hirta*), sometimes 30 ft. high, and the smaller smooth sumach (*R. glabra*), sometimes 20 ft high, both of which in autumn display highly coloured fruit and foliage The dwarf or mountain sumach (*R. copallina*) is a small shrub in the North and a tree 30 ft high in the South. Its leaves, as also those of the two preceding, were formerly much used in tanning The aromatic sumach (*R. aromatica*), 3 ft. to 8 ft. high, with pleasant-scented foliage, occurs in the eastern States; its western counterpart, the skunk-bush (*R. trilobata*), with ill-scented foliage, is found from Illinois to Oregon and southward. The mahogany sumach (*R. integrifolia*), the laurel sumach (*R. laurina*), and the sugar-bush (*R. ovata*) are elegant shrubs, native to southern California.

The lacquer-tree (*R vernicifera*), of Japan, yields Japan lacquer. The wax-tree (*R succedanea*), also of Japan, furnishes wax used in candle-making. *R. javanica*, of eastern Asia, and *R. hirta* var. *dissecta*, a North American form, are planted for their ornamental foliage.

SUMATRA, lying between 5° 39′ N. and 5° 57′ S., so that the Equator divides it into two nearly equal parts, is the westernmost, and, after Borneo, the largest of the Great Sunda islands, of the Malay archipelago, and forms part of the Dutch East Indies. Its axis runs from south-east to north-west, Sunda strait to Malacca passage; it is 1,060 miles in length, and its greatest width is 248 miles. With its dependencies, Sumatra has an area of 180,380 sq m. (alone, 167,480 sq m) and is nearly four times as large as Java, almost as large as Spain, and thirteen times the size of the Netherlands. The economic development of Sumatra, though it is far behind that of Java, is much further advanced than that of any other of the islands of the Dutch East Indies.

In relief, Sumatra consists of a high mountain chain which runs along the western coast, descending eastwards to a huge tract of flat, alluvial land, seamed with many large rivers and their scores of tributaries. Its great mountain chain is a link between the mountain system of Lower Burma, which is continued by way of Preparis and Great Coco islands, the Andaman islands, and the Nicobars, to Sumatra, and thence to Java, and on through the Lesser Sunda islands to the Moluccas. This (Sumatran) chain extends for a distance of over 1,000 m., and contains numerous volcanic peaks of heights from 5,000 to over 12,000 ft. The whole system is known as *Bukit Barisan,* or the Barisan mountains, and consists in general of two or more folded chains running parallel to each other, with a valley between, which is broken up into separate sections by the intrusion of volcanic massifs, and along this valley lies a string of mountain lakes, from south to north—Ranau, Korinchi, Singkaran, Maninjau and Toba. By far the largest of these is Lake Toba, which is 45 m. long, by 15 wide, with a depth of 450 metres, and which has a large island, Pulau Samosir

The line of volcanoes commences with Krakatoa, in Sunda strait, then continuing southwards, Sinabung (7,930 ft), in the centre of the island, in the Battak country, as also are Sibayak (7,075 ft), and Pusuk Bukit (6,562 ft.), Berapi (5,875 ft), Mandailing group; Pasaman (9,844 ft.), Talang (8,399 ft), Merapi, (9,484 ft), and Singalang-Tandikat (9,479 ft), all in the Padang highlands, Korinchi, or the peak of Indrapura (12,484 ft.), in the Korinchi group; Kaba (6,528 ft.), in the Rejang group; and Dempo (10,326 ft), in the Pasuma group. In all ninety volcanoes have been discovered, twelve of them now active.

Sumatra, like Java and Borneo, is formed largely of strata of the Tertiary period, although it contains also two schistose formations, one of which is anterior to the carboniferous period. The Tertiary series are more complete than in Java; the numerous volcanoes, so characteristic of the whole archipelago, are due to the quaternary period. The western mountain system is composed largely of Archaean rocks, with occasional longitudinal bands of Jurassic and Cretaceous rock. The whole ridge is metalliferous, and erosion of the ranges exposes their mineral contents. Gold and silver are known in close association, lead in association with silver, copper, and tin, antimony and cobalt, marine schists, yielding fossil fish and plants, give petroleum; there are iron deposits, and in the stratified rocks coal, in the Lampong and Padang highlands district of Eocene age, and in Bencoolen district of Miocene. The coal-fields exist in and not under the Tertiary strata, rendering their contents easier of access. The crystalline rocks (granites, basalts, and their allies), are of various geological ages, and they are exposed by denudation, or pushed through by intrusion Intrusion causes change in some sedimentary rocks, sandstone changing into quartzite, limestone into marble, and clay, or shale, under pressure, into slates.

The river system of Sumatra is extensive and of great value to the country. Owing to the proximity of the mountains to the west coast, the rivers there run in valleys with a steep slope, have a very short lower course, and are unnavigable, except near the mouth in the case of a few. The eastern rivers run through alluvial plains, have extensive drainage areas (they are often impeded by silt), and form the principal, and often the only means of communication, and are of such value to the community, that many of the districts they water are named after the rivers. South of 3° N., there are extremely important rivers, the first, in order, being the Asahan, which drains the lake of Toba, and is navigable by steamers for a portion of its length, next the Panei (Bila and Barumun), with a very wide mouth, then the Rokan, over 120 m. long, and flowing into Malacca straits through a wide, muddy estuary, is navigable for 70 m. inland; the Kampar, a very long river, navigable for ocean steamers for 18 miles, the Indragiri, which is navigable for ocean steamers as far as Kulachenako, and for river steamers as far as Cheranti The Jambi, which springs from the peak of Indrapura, is the most beautiful and largest of all the rivers of Sumatra, having a maximum navigability of just under 500 m ; the Musi is the only one which bears comparison with the Jambi. Ocean-going vessels can reach Palembang, 54 m. from its mouth, steam launches and motor boats navigate the river for 200 m , and small boats for 330 miles. Below Palembang the Musi splits up into a number of channels which spread out amidst a vast unhealthy swamp covering an area of some 4,600 m These subsidiary channels slowly deposit their suspended quota of mud among the mangroves, thus gradually creating new land, and slowly the whole coast-line is advancing sea-wards and tending to fill up the Malacca straits and join Sumatra to the Malay peninsula. But this tendency may be counteracted by a sinking of the land.

On the coast, there are small semi-circular bays, but few large indentations, the principal being Koninginne bay, which, in Emmahaven, gives a good harbour, and Tapanuli bay (Sibolga). North of Tapanuli and south of Indrapura none of the indentations provides immunity from the south-west monsoon The north coast has precipitous cliffs crowned with dense vegetation in some parts; in others sandy beaches, and well cultivated plains, whilst the bay of Oleh Leh gives shelter for shipping. The southern coast consists, mainly, of two large indentations, Lampong bay and Semangko bay, the eastern shore of the former being mountainous and little indented, whilst the western is much cut up; the centre of the bay has a good harbour (Teluk Betong). Semangko has a mountainous coast-line, with little indentation. The whole of the east coast is formed of morasses and sandbanks, which break up into innumerable islands, large and small, particularly about the central portion, and the coast-line is deeply indented in many places and very irregular The indentations are not permanent, the coast is constantly advancing, and it is difficult to establish practicable ports or landing-places. Belawan, in the north, is the best harbour, and other harbours, also on the northern part of this coast, are Sigli, Lho Seumawe, Langsa, and Tanjong Balei. Sumatra has a chain of islands off the west coast which rise from the edge of the submarine platform and serve as a kind of outer barrier. They have an area of 5,769 sq m., several are thickly populated and some are of considerable size, whilst many are of volcanic origin and most have rocky, reef-bound coasts, dangerous of approach.

Climate.—The climate of Sumatra resembles that of Java and is hot and extremely moist, but in most eastern coastal districts and often for many miles inland the heat is tempered by cooling land and sea breezes, the wind generally being north-east by day and south-west by night all the year round. The wind system of north Sumatra differs from that of the greater part of the Dutch East Indies, the north-east monsoon blowing from December to March, and the south-west monsoon from May to October. During the south-west monsoon the strong squalls from the north-west known as "Sumatras," accompanied by thunder, lightning, and rain, blow in the Malacca strait, and they have been known to occur during the north-east monsoon. On the west coast the influence of the north-east and south-west monsoons is felt as far south as 4° N.; between 4° N., and 2° N. there is a region of calms and light variable winds, which have a westerly tendency from March to November, when the north-west monsoon is blowing along the remainder of the western coast, *i.e.*, from 2° N. to 5° 57′ S., and an easterly tendency from May to September, the period of the south-east monsoon on the western coast. Southern Sumatra has the highest temperatures, and the mean annual temperature, for the lowlands, is about 80°. At Toba, in the Battak country (3,772 ft.), this is 69·6°, and higher altitudes show a corresponding reduction. On the whole, temperature in Sumatra is slightly higher than in Java. March, April and May are the hottest months; January and February the coolest, but the difference does not exceed 2°. The different wind distribution causes a variation of the seasons. Thus in north Sumatra October is the wettest month and February and March are the driest, whilst elsewhere the wettest months are December, January, and February, and from July to September is the dry period. Accordingly the rainfall varies considerably. The annual average rainfall for north Sumatra is 95·71, for east Sumatra 106·27, and for west Sumatra 122·32 inches. The west monsoon gives the heavier rainfall and the fall is accentuated in west Sumatra by the high mountains.

Fauna.—Notwithstanding the proximity of the island to Java the fauna of Sumatra shows a greater resemblance to that of Borneo than to that of Java, this being particularly noticeable as regards the fauna of the east coast of Sumatra, whilst that of the west coast and the islands adjacent is more allied to the Javan fauna. The orang-utan, common to Sumatra (in the north-east), and Borneo, is unknown in Java; the *siamang* (*Hylobates syndactylus*) is found in Sumatra only; there are ape species common to Borneo and Sumatra, also the elephant, tapir and Malayan bear, all of which are unknown in Java, though, on the other hand, Sumatra shares the tiger with Java, whilst it is unknown in Borneo. The one-horned rhinoceros of Java is unknown in Sumatra, which shares a two-horned variety with Borneo; the wild ox, or banteng (*Bos sundaicus*), known in Java, seems to be lacking in Sumatra, which has, however, a species of antelope, (*kambing-utan*), found only in the loneliest districts of the mountains. The Sumatran fauna also includes the apes *Hylobates agilis, Semnopithecus melalophus, Cercocebus cynomolgus* and *Macacus nemestrinus,* fox-nosed monkeys (*Tarsius*); the slow loris (*Nycticebus*); tupai (*Tupaja*); and the flying maki, or lemur (*Galeopithecus volans*); the flying fox, the kerbau, or buffalo (*Bos bubalus*), the Malayan deer (*Cervus muntjac*); wild dog; wild pig; Sumatran hare (*Lepus netscheri*); and civet cat. Species of birds exist in Sumatra which are unknown in Java—the great Argus pheasant, the fire-backed and ocellated pheasants, crested partridge, small Malacca parrot (*Psitticus incertus*), great helmeted hornbill (*Buceroturus galeatus*), pheasant ground cuckoo (*Carpococcyx radiatus*), rose-crested bee-eater (*Nyctiornis amicta*), and the great and green-crested gapers. Other Sumatran birds include the woodpecker, pigeon, and trogon. Insects, which also show a marked difference from those of Java, comprise the beautiful *Papilio memnon* butterfly, the *Papilio cöon,* and other species of this section, the *Kallima paralekta* (which attaches itself to and is able to imitate the leaf of a certain plant so closely as to secure itself from the attacks of enemies), flocks of Cyrestes, *Melantis suradeva,* a new species of *Amnosia, Euthinia fulva,* one of the prettiest species of *Ecophoridae,* two specimens of the curious genus *Homopsyche,* and the moth *Pentacitritus transversa.* Lizards, large and small, frogs, tortoises and turtles abound, crocodiles frequent the mouths of rivers and are also found up-stream, there are many varieties of poisonous snakes, the rocks around the coast yield many kinds of shell-fish, and the sea, ponds, and rivers numerous sorts of edible fishes. The striking difference in species between the fauna of Sumatra and Java led A. R. Wallace to assert that the first severance of Sumatra from Java is very ancient; that since the epoch of the first (volcanic) disturbance several distinct elevations and depressions may have taken place, and the islands may have been more than once joined with each other or with the mainland (of Asia), and again separated, and that successive waves of immigration may thus have modified their animal productions and led to those anomalies in distribution which are so difficult to account for by any single operation of elevation or submergence.

Flora.—The flora of Sumatra bears a strong resemblance to that of India and the Malay peninsula in the northern part of the island, and to that of Java in the south, but it has also many varieties distinct from either, and not only different varieties, but different genera from those of Java. The pine (*Pinus Merkusii*), not found elsewhere in the East Indies, is found as far south as the Equator, and the distribution of vegetation does not appear to depend so closely on altitude as in Java. A striking feature of the vegetation is the flower of the huge Rafflesia, known from 20 to 24 inches in diameter. There are immense areas of savannah country, covered with coarse grasses, chiefly *alang-alang* and *glaga,* which stifle other forms of vegetation and give shelter to hordes of wild animals. These tracts occur as low as within 700 ft. of sea level. Myrtles, eucalyptus, bamboo, rhododendrons and moss-loving orchids are well known, palms abound, and orders strongly represented are Dipterocarps, Begonias, Nepenthes, Oxalidaceae, Melastomaceae, Myristicaceae, Chryobalanaceae, Connaraceae, Cyrtandraceae, Amyridaceae, Epacridaceae, Eriocaulaceae and Ternstromiaceae. There are zones of vegetation, differing with altitude, but the general tendency is for all forms to grow at a lower level than is the case in Java. The Sumatran forest begins at a height of from 300 to 400 feet, and it extends to all but the highest mountain peaks, this wealth of vegetation producing very beautiful mountain scenery. The forests contain the finest timber-producing woods in the archipelago; there is not only a great variety of trees, but they possess both stature and beauty. Deciduous trees such as the oak, chestnut, etc., grow on lower slopes than in Java, and apart from ebony, ironwood, camphor-wood, and sandalwood, there are also many species of resin and wild rubber-producing trees. The forestry service of Java has been extended within recent years to Sumatra, which is divided into five districts for this purpose, and all wasteful exploitation of timber is checked, where this is possible.

Population.—The following table gives the area and population of the several administrative divisions and of the island as a whole.

Division	Area	Population, 1927
	sq.km.	
Sumatra East Coast	93,500	1,183,283
Sumatra West Coast	50,723	1,598,262
Lampong Districts	28,268	239,985
Palembang	85,918	844,626
Bencoolen	25,886	271,373
Tapanuli	38,227	895,146
Achin and Dependencies	55,549	782,493
Jambi	44,452	179,691
Indragiri (the mainland territory of Riouw and Lingga Dependencies)	32,391 (with Riouw-Lingga)	224,145 (with Riouw-Lingga)
Total	454,914	6,219,004

The population includes 19,259 Europeans and Eurasians, and 229,775 foreign Asiatics, including Chinese. One-third of the

Europeans and four-fifths of the Chinese live in the East Coast Government. Sumatra has a very small urban population.

Arabs, Chinese and Indians of many races have long been settlers round the coast, where, also, there were once Hindu-Javanese colonies, and the mixture of blood which has resulted, and European contact, has given a much higher civilization than that which prevails in the interior, where the Hindu-Javanese influence was little felt in many regions, and even Islamic culture failed to penetrate, leaving the people in their ancient state of animistic barbarism. Many of the indigenous tribes of the interior are still in a state of development comparatively low, but simple education is spreading under advancing Dutch influence, barbarous customs are disappearing rapidly, lack of clothing is giving place to garments of Malayan style, a higher standard of living is beginning to assert itself, also improved methods of agriculture, and there are the beginnings of industry, whilst both Christianity and Islam are tending to replace the animism of savagery.

The whole of the indigenous population had, probably, a common Malayo-Polynesian origin, but to-day all the races may be classified as Malay, in a wide sense, the pre-Malay blood of the country having been absorbed thoroughly, whilst there is no race of true Negrito type. Of these Malayan divisions the Achinese (*q.v*) inhabit the ancient kingdom of Achin in the north-western promontory and the whole of the north of the Gayo country.

Gayos.—The Gayos live in the northern central portion of the country, between the Achinese and the Battaks, with the Alas on their west, living mainly in the valley of the Simpang Kiri. The Gayos, numbering about 60,000, are essentially a highland and insular race, and form an ethnographical unit, all speaking one language. Akin to the Battaks, they are agricultural and pastoral, a friendly and honest race, living in well-built houses of wood, in small scattered villages, and are the equal in civilization of the Chams of Indo-China Their chief crop is rice, maize, cotton and sugar-cane are grown, horses and cattle are reared, and forest products are collected, and there is an export trade to the coast in the latter, and in horses and cattle. Forest tracks, only, exist and transport is difficult, much being carried on the backs of the natives. Mohammedan by religion (with an animistic substratum), they are clever craftsmen in wood-carving and plaiting, and they make weapons. They are patriarchal.

Battak Groups.—The Battaks number 500,000, and inhabit the mountainous region about Lake Toba, the residency of Tapanuli, and a large part of the northern coast. They are divided into several groups, differing considerably in language and customs. Of Malay-Polynesian origin, the Battaks are nearly one-third Mohammedan, 80,000 are Christian, and the remainder Animist. Their old-time cannibalism, which was largely punitive and ritualistic, and slavery have disappeared. Their standard of culture is high; they possess a written language of their own, build compact and picturesque houses, with horned roofs (on piles, many families inhabiting one house), and have rice barns, and a communal hall, and the houses are beautifully decorated, the Battaks being clever craftsmen in wood, ivory and copper, whilst they understand iron smelting. They are good agriculturists, rice cultivation, wet and dry, being their chief occupation, though maize, coffee, fruit and vegetables are grown, and horses, cattle, buffaloes and pigs are reared, and they weave and dye cotton garments, make their own jewellery, also pottery, and there are amongst them keen traders and shop-keepers, teachers and even doctors. Society is patriarchal, marriage exogamic, women are in a subordinate position, but are treated kindly, and polygamy is practised. There are village councils, a nobility, land belongs to a family, or village, but tenure differs.

Menangkabau Malays—South of the Battaks, in the Padang highlands and surrounding districts are found the Menangkabau Malays. At one time their ancient and powerful kingdom (which, legend says, rose on the ruins of a Hindu empire) covered the greater part of central Sumatra. They sent out emigrants to the Malay peninsula, and represented the highest form of Malayan civilization. Although converted to Islam, the Menangkabau Malays retained their ancient custom of the Matriarchate, *i e.*, descent and inheritance in the female line, which is said to be preserved nowhere in a purer form than amongst these Malays. A wife remains after marriage with her kinsfolk on the mother's side, the husband, having no home of his own, only visits his wife, and resides in his mother's house. Names, privileges and property derive from the mother's side. The eldest man of the elder female line is termed *Mamak*, and he is the keeper of all the possessions of the family. Land is unalienable, and always comes back into the possession of the family or village. Marriage between members of the same tribe is not allowed. Houses, raised from the ground, are very ornate and picturesque, with horned ridge-poles and finely-carved wooden fronts, sometimes painted. Several families bearing the same patronymic live in the same house, and several houses, their rice-barns, a communal house, a mosque, school, an inn and market form a village. There are priests and nobles; the people live by trade, agriculture, hunting and fishing. Their language is one of the chief branches of Malay (with a few words of Sanskrit origin). At one time the Javanese script was used; now this is Arabic. Literature is legendary and poetical. Native chronicles derive the Menangkabau dynasty from Alexander the Great; and the Achinese princes derived their ancestry from a missionary of Islam.

Other Peoples.—South of the Menangkabaus, in the Indrapura region, live the Korinchis, a small community, partly Mohammedan, partly Animist, and east of these, in Jambi, Malays, using the term as denoting a seafaring race (Mohammedans), speaking Malay and having the usual Malay characteristics, not fond of work, prone to finery, devoted to sport and gaming, friendly and intelligent, and living in tribes In Rejang-Lebong there are the Rejangs, a rather truculent people, who work in the gold and silver mines of their country, are Mohammedans, possess a script of Indian origin, and have Hindu antiquities scattered amongst them In the south are the Lampongs, who were largely under Hindu influence and attained a high degree of civilization which they have retained. Pepper culture, for the European market, is the chief occupation, and many plantation owners are men of wealth, employing a great deal of outside labour. Among the primitive tribes, there are the Kubus of the Jambi mountains, who are nomadic and quite savage, almost dwarfs, and have frizzled hair denoting negritic blood. All are extremely shy and isolated peoples, but quite peaceable, nomadic or semi-nomadic, primitively clothed, living by fishing and hunting and rude agriculture. (For "island peoples" *see* NIAS, MENTAWEI, BATU, SIMALUR.) Enggano people are Animistic Malays, fishers and agriculturists.

Administrative Divisions and Towns.—The northern part of Sumatra is administered by the Government of Achin and Dependencies (*q.v.*), the capital of which is Kota Raja (*q.v.*), with Oleh-Leh as its port. Other ports are Sigli, Idi, Lho Seumawe (pop. 1,725), and Langsa, on the north-east coast, Meulaboh (pop. 1,732), and Singkel, on the west coast. Apart from Lhoinga on the north coast, Chalang, on the west coast, and Tapatuan, which have a *controleur*, Kuala Simpang near the southern boundary on the east coast, Meuredu, Bireuen and Kota Chane (Alas country), Blang Kejeren (Gajo country), Lokop and Takengun, a mountain station (4,000 ft.), in the interior, there are no towns worthy of mention. Exports in 1926 were 19,016,628 and imports 9,636,745 guilders On the east coast, below Achin from 4 m N. to the Equator, and extending inland to the central mountains and Lake Toba in the north, and to the western mountains in the south, is the Government of the East Coast of Sumatra, the largest administrative unit in the island, with its capital at Medan, and with its chief port Belawan (Deli) (*q.v.*).

A railway runs from Kuala Simpang, where it links up with the Achin coastal railway, to Tanjong Balei (pop. 7,970), the capital of the Sultanate of Assahan. It is the seat of the Sultan of Assahan, who has two palaces here, and, situated at the mouth of the Assahan river, is a port of call for vessels of the Royal Packet Navigation Company (which call also at Belawan, Bengkalis, Labuan Bili and Bagan Si-Api Api), with a trade in copra, rubber and gambier. The railway ends here, but a long motor road runs inland to Si Paré Paré. Other motor roads follow more or less the line of the coastal railway; they also connect other

centres. South of these railways and roads there are no communications save riding-tracks and the rivers. Towns are: Bengkalis, on the island of that name (pop. 2,398), Pasir Pengarajan, and Gunung Sahilan, in the interior, Labuan Bili, on the coast, Siak Sri Indrapura, on the Siak, and Pakan Baru, 100 m. up the Siak, which is a port of call for vessels of the Royal Packet Navigation Company, and is connected by road with Gunung Sahilan. East Coast imports (1926) amounted to a total of 90,387,313 and exports were 277,453,450 guilders. Below Achin, on the west coast, opposite the East Coast Government, is Tapanuli (*q.v.*), a residency, its capital and chief port being Sibolga (pop. 5,822). Other ports are Barus and Natal, and all three are ports of call for Royal Packet Navigation Company steamers. Coffee, rubber and nutmegs are grown. Imports (1926) 5,072,923 and exports 14,899,537 guilders.

South of Tapanuli the residency of the West Coast of Sumatra has its border. With the exception of a few alluvial plains along the coast it is very mountainous, comprising the beautiful region of the Padang highlands (*q.v.*), with large lakes, Maninjau and Singarak, and many high mountains. Coffee, nutmegs, ground-nuts, coco-nuts (copra is a chief export) and cinchona are grown, apart from the usual native crops. There are coal-fields by the sides of the Ombilin river, near Sawah Lunto. Gold and silver are mined. The capital and chief port is Padang (*q.v.*) (pop. 41,238), and other ports are Ayerbangis and Priaman. Royal Packet Navigation Company vessels call at all these ports and ocean steamers at Padang. Priaman is connected by rail with Padang, and from it the railway extends to Sungai Limau along the coast. A coastal highway from Padang passes southward along the coast through Painan and Balai Salasa to Indrapura. Another road goes inland to Solok (pop. 1,965), Sawah Lunto (pop. 14,353), headquarters of the coal-mining district, Sijunjun-Jung and Sungai Dareh near the eastern boundary. A railway line from Padang runs inland to Padang Panjang (pop. 6,842) and 2,365 ft. above sea-level, where there is a small hotel and an industrial school for native girls and a good centre for mountain scenery. From there it branches northwards to Fort de Kock (pop. 12,624) (assistant resident), with hotels, an interesting old Dutch fortress, and the chief excursion centre for the Padang highlands. A good motor road connects with Sibolga, in Tapanuli, and thence to Lake Toba and across the island to Arnhemia. The railway extends inland to Pajokumbu (assistant resident) (pop. 5,121) (1,680 ft., a.s.), another excursion centre, which has a quaint native market, is a tobacco-growing centre and has a small hotel. In 1926 West Coast imports amounted to 22,563,046 and exports to 27,259,775 guilders.

BY COURTESY OF ROYAL PACKET NAVIGATION CO.

A YOUNG NATIVE MAN AND SLAVE

The residency of Bencoolen extends along the coast from the West Coast Government. Coffee, cloves, coco-nuts, tea and rubber are grown, and Bencoolen has gold and silver deposits in the Rejang-Lebong district. Coal occurs, but is not worked. The capital is Bencoolen (pop. 7,867), which is also the chief port. Royal Packet Navigation Company steamers call here and at Kru and Bintuhan. Bencoolen was the headquarters of the British administration in Sumatra, and the old Fort Marlborough still stands. Imports into Bencoolen for 1926 were 2,602,727 guilders and exports were 3,140,814 guilders.

East of the West Coast residency lie the residencies of—first Indragili, the mainland portion of the residency of Riouw-Lingga, the capital of which is Rengat (assistant resident), and which had, in 1926, imports valued at 6,991,360 guilders and exports 17,248,462 guilders; then Jambi (*q.v.*), the capital and port of which is Jambi (pop. 16,164) (imports [1926] 11,324,513 and exports 26,293,699 guilders); and then Palembang (*q.v.*), with capital and port the town of the same name (pop. 62,438), (imports [1926] 41,775,831 and exports 89,827,248 guilders). The whole of the south-eastern extremity of Sumatra is occupied by the residency of the Lampongs (*q.v.*), capital and port Teluk Betong (pop. 14,980), and which is a great pepper-growing centre. Imports (1926) were 1,173,722 and exports 15,492,735 guilders.

Agriculture.—Agriculture is divided into two classes, native and European. Native agriculture is occupied chiefly with rice cultivation, rice being the main food staple. Both *sawah*, wet, and *ladang*, dry, methods are used. Government helps cultivation with irrigation and agricultural advice. Sumatra does not grow sufficient rice to feed its population and has to import rice from British India, Saigon and Siam. Another food crop is maize (grown by the Battaks as a primary crop). Coffee, tobacco, pepper, cotton, kapok, cloves, nutmegs, coco-nuts, gambier, ground-nuts and betel-nuts are grown for export, generally being sold to Chinese middlemen. Of very recent years there has been a great expansion of native-grown rubber. Cattle-, pig- and horse-breeding is carried on in a primitive fashion (the Battak-bred horse is small; the Padang breed is larger), fishing is a common occupation (there is a considerable dried fish export trade, mostly in Chinese hands), whilst shells, trepang and prawn-spawn are exported, and such forest products as wild rubber, *jelutong*, rattan and resins are collected for export, while ebony, sandalwood and ironwood are cut for sale.

European agriculture is estate cultivation, the chief products being rubber and tobacco. Rubber is grown chiefly on the East Coast, with imported labour—Javanese, Chinese, Indian, etc. At the end of 1926 there were 238,563 hectares of rubber planted in Sumatra. The total crop for 1925, including native-grown rubber, was 133,660 tons. The tobacco centre is on the East Coast. Sumatra tobacco is a thin silky-looking leaf, of excellent colour and quality. It fetches a high price in Holland. In 1926, 19,008 hectares were under cultivation and the crop was 20,049 tons of estate leaf tobacco. Coffee produced in 1926 was 36,313 tons. Tea is also an important crop. In 1926 there were 15,802 hectares planted and production was 8,558 tons. Tea-growing is a young industry but the quality is so high that it bids fair to prosper. The intensive cultivation of the oil palm during the past seven years has been remarkable. The cultivated area is 28,642 hectares and the production for 1926 was 9,483,990 kg. of oil and 1,627,230 kg. of kernels. As against 36% of fatty acids in African palm oil, Sumatra oil contains only 12%. Cinchona (quinine) is produced on the West Coast. The planted area is 2,181 hectares, and production, in 1926, was 1,326 tons. A rapidly extending cultivation of agave fibres surpasses the production of the much older Java plantations. Production in 1926, from large estates on the East Coast, was 22,000 tons. Extensive areas are being planted with manila hemp, until now grown exclusively in the Philippine islands. Two East Coast estates in 1926 produced 2,800 tons of gambier. Coca (cocaine) is grown on the East Coast.

Native rubber production in 1925 was 53,000 tons. Pepper production in 1926 was about 23,000 tons and copra production, chiefly native, 33,366 tons. Padang shipped 14,607 buffalo hides and 8,879 cow hides also 1,317 tons of damar, 100 tons of gum benzoin and 1,000 tons of rattan, whilst Palembang shipped (1926), 3,633 tons of rattan and 1,053 tons of gum benzoin. Tanning barks to the extent of 18,800 tons were shipped from Sumatra East Coast, and 4,900 tons of areca nuts, also 2,339 tons of areca nuts from Palembang. Shipments of areca nuts from Acheen (quantities unascertainable) were much larger. The total imports and exports for Sumatra in 1926 were, respectively, 191,528,180 guilders and 490,227,730 guilders. Exports from Belawan were 189,463,289 guilders, from Palembang 89,287,248 guilders and from Padang 27,289,775 guilders.

Industries.—Coal is mined at Ombilin, near Sawah Lunto,

in the Padang highlands (mining started in 1892), at Bukit Asem, 12 km. south-west of Muaro Enim, in Palembang, at Pulu Punggung, Darmo, Buluran and Laje, in Palembang, and at Bukit Durian (West Coast) Ombilin and Bukit Asem are operated by the Government and are modern-equipped Production in 1925 was, Ombilin, 543,745 tons and Bukit Asem 245,638 tons. Petroleum is secured in Achin, East Coast, Palembang and Jambi. Crude petroleum production in 1925 was—Palembang 441,588 tons, East Coast 79,579 tons, Achin 74,670 tons and Jambi 13,274 tons. The oil produces benzene, kerosene and lubricating oil Gold and silver are mined on the West Coast and in Bencoolen. Government-owned mines in 1925 produced gold worth 550,281 guilders, and silver worth 1,608,198 guilders, the Rejang-Lebong mine, gold 2,117,244 guilders and silver 460,076 guilders, the Simau mine, gold 2,334,507 and silver 910,952 guilders, the Aequator mine, gold 926,456 guilders and silver 983,641 guilders, and the Kinandam mine, gold 187,220 and silver 449,516 guilders. Lead, sulphur, naphtha, alum and saltpetre are found, also lignite and magnetite. A tank for palm oil has been completed at the port of Belawan, from which the oil will be pumped to steamers

HISTORY

Some authorities suggest that Sumatra, not Ceylon, may have been the Taprobane of Pliny. The island was the first to receive the Hindu emigrants whose descendants by the 7th century had made it the seat of a powerful Hindu Kingdom. In the 13th century the Arabs invaded Achin and Mohammedanism took firm hold of some of the most important states. On ancient inscriptions discovered in the Padang highlands, the island was called "the first Java"; Marco Polo called it "Java Minor." It became known to Europeans as Sumatra through Ludovico de Varthema, an Italian, in 1505. The Portuguese established a trading post about 1509 and were driven out by the Dutch at the end of the century. For the next three centuries the Dutch were engaged in costly efforts to establish supremacy in Achin: a thirty years' war, started in 1873, is estimated to have cost 250,000 lives and £50,000,000 sterling In 1602, the English first visited Achin, when Sir John Lancaster was well received, and eleven years later, to the annoyance of Dutch and Portuguese, were given permission to start a factory. Elsewhere Dutch sovereignty was gradually extended—in 1664 over Indra-pura; in 1666 over Padang; in 1620 they secured a modest concession in Palembang; the Sultans repeatedly sought to throw off the yoke; twice—in 1654 and 1819—the Dutch were actually driven out, and not till after a serious revolt in 1851 had been suppressed was their tenure secure. In Jambi the efforts of the Sultans to escape the consequences of concessions were equally persistent. Throughout the 18th century Dutch and British maintained a constant rivalry in Sumatran waters. Benkulen, where the English acquired a footing in 1685, was among the sources of irritation to the Dutch, and was handed over to them in 1824 in exchange for Malacca. In Deli, in Menangkabau—whose princes claimed descent from Sultan Iskander (Alexander the Great)—and elsewhere, the Dutch established their authority in the teeth of repeated insurgence and generally as the result of the quarrels of native rulers who invoked their help and had to pay the price. Politically Sumatra is not as far advanced as Java, but is under the Governor General of the Netherlands East Indies, and enjoys the same representative rights in the Volksraad. (C. H.; E. S.)

SUMBA (Dutch *Soemba*), also known as Sandalwood, one of the Lesser Sunda islands, Dutch East Indies; area 4,600 sq.m. Sumba forms part of the residency of Timor. The island is dominated by heights of from 2,200 to over 3,000 ft. Several bays on the north coast give good anchorage, the best being that of Waingapu. The rivers, mostly unnavigable, are of importance for agriculture. A fertile soil and a fairly good rainfall (average 63·7 in annually) help to produce good forests, grazing ground and food crops. The forests yield sandalwood (giving rise to the old name for the island), dye-woods, wax and wild cinnamon. On the grazing grounds are bred some of the finest horses in Netherlands India—the sandalwood breed—and fine cattle (Ongole), both figuring largely as exports, whilst rice is raised on *sawahs* and *ladangs*, and maize, coffee, tobacco, coco-nuts, vegetables and fruit are grown; copra being exported. The population is 124,401, consisting, apart from the indigenous Sumbanese, of people from Flores, Savu and Rotti. The Sumbanese are a Malayo-Papuan people of good physique. Except in the interior, where clothing is far more primitive, the *sarong* and *baju* are generally worn by women, and sometimes by men. Both sexes are fond of ornaments. They cultivate the soil, fish, mostly in rivers, not being a sea-loving race, collect forest products, edible birds' nests and turtles, make fishing-nets and plait baskets. There are workers in copper and iron, whilst the women weave, spin and dye, and make pottery. The natives are largely pagan (there are some Mohammedan), and make offerings on stone altars. A particular breed of horses is held sacred. The Sumbanese enjoy feasts, music and dancing. Marriage is by dowry and polygamy is fairly common amongst the upper classes There is no written form of the Sumbanese language, which is allied to that of Savu Sumba has numerous megalithic monuments. The assistant resident lives in Waingapu (pop 1,622), and vessels of the Royal Packet Navigation Company call

The sandalwood of Sumba attracted attention to the island in the 17th century, when Sumba appears to have been a tributary of the state of Bima, in Sumbawa. Later Sumba became independent of Sumbawa, and treaties were concluded in 1756 with the Dutch. Between 1856 and 1874, new treaties were made, but there have been frequent difficulties with the natives, due to piracy and slave raids. The trouble continued and in 1901 the Dutch were compelled to land troops. Most of the chiefs of the tribes are now bound by the "short declaration," but there were disturbances in Sumba (Lamboja), necessitating a Dutch armed force as recently as 1914 (E E. L)

SUMBAWA (Dutch SOEMBAWA), one of the Lesser Sunda Islands, Dutch East Indies, between Lombok and Flores, and separated from the former by Alas Strait and from the latter by Sapeh Strait and the island of Komodo. Sumbawa with neighbouring islands, has an area of 5,240 sq m From 30 to 100 m. north of Sumbawa there are the Tenga and Sabalana Islands, small low banks, surrounded by reefs. Mountain chains traverse the centre of each of the peninsulas. There are only a few stretches of alluvial land along the coast: off the southern shore great depths of water are soon reached in the Indian Ocean. The mountains, some volcanic, are highest in the north. Mt. Tamboro is still 9,042 ft. high, though it was very severely damaged in the eruption of 1815. No other volcanoes appear to be active. The average annual rainfall (Bima), is 93 in. Agriculture is carried on, rice being raised on *sawahs* and *ladangs*, whilst maize, cotton, coffee, tobacco, coco-nuts, onions, and other vegetables, and fruit, are grown. Horse and cattle breeding are important industries. The forests yield teak and dye-woods, sapan wood the chief.

The population of Sumbawa is 246,179. The natives of the western peninsula (Sumbawa) are of Malayan stock and allied to the Sassaks of Lombok, and those of the eastern peninsula (Bima, Sanggar and Dompo), are Malayo-Papuan.

Sumbawa is part of the residency of Timor and dependencies, and is governed by an assistant resident, who resides at Bima. Vessels of the Royal Packet Navigation Company call at Bima, Sumbawa, and Taliwang, affording regular communication with Macassar, the other Sunda Islands, and Java ports. Sumbawa

consisted originally of six States, all owing allegiance to either Gowa or Macassar in Celebes—Bima, Dompo, Sanggar, Tambora, Papikat and Sumbawa: after a rebellion in Tambora in 1815 that State and Papikat ceased to exist. In 1701 the Dutch arbitrated between Sumbawa and other States in the island engaged in civil war, and in 1765 the Dutch made a separate agreement with Sumbawa, revised in 1875 and again in 1905, under which it has a certain measure of self-government. A contract made with Bima in 1857 and again in 1886, on the lines of that made with Sumbawa, was revised in 1905. It allows the State some self-governing powers. Sanggar was subject to the sultan of Ternate originally, then to the Sultan of Macassar, and after the Bongay Contract of 1667 it became a fief of the Dutch. A treaty made in 1858, and revised in 1905, defines its right of self-government. Dompo gave up allegiance to Macassar after the Bongay Contract, was a party to the Sumbawa treaty with the Dutch of 1765, and has had its self-governing powers fixed by subsequent treaties.

(E. E. L.)

SUMBUL or **SUMBAL,** also called Musk Root, a drug occasionally employed in European medical practice. It consists of the root of *Ferula sumbul*, Hook., a tall Umbelliferous plant found in the north of Bokhara, its range apparently extending beyond the Amur. The action and uses of the drug are the same as those of asafetida (*q.v.*).

SUMERIAN LANGUAGE. The language now called Sumerian was revealed about the middle of the 19th century to Sir Henry Rawlinson and other scholars when examining the baked clay tablets which had formed the library of Ashurbanipal, king of Assyria. These had recently been discovered by Layard in the ruins of Nineveh and brought to the British Museum. When the cuneiform script in which they were written was deciphered, it was found that certain of them contained works composed in a language entirely different from the Semitic tongue of the Assyrians, but sometimes provided with interlinear translations into Assyrian; other tablets were dictionaries in which the words of this strange language were assigned their Assyrian equivalents.

It was many years before the study of Sumerian was firmly established, although its meaning could be so confidently interpreted from the Assyrian translations. This was due both to the impossibility of discovering cognate languages, and to the factitious obstacle of a paradox which was subsequently maintained, chiefly by Joseph Halévy, that Sumerian was no true language at all, but a purely artificial system of secret writing invented for mystification of the vulgar by the Assyrian priests. The second of these hindrances was ultimately removed by the discovery of monuments inscribed in this language, which evidently belonged to a time before the Semitic tongue was written in Mesopotamia; the problem of finding a cognate language remains.

Its Speakers and Script.—The area covered by this ancient speech was probably never very extensive. It is, at any rate, found only upon the monuments from the country lying between the Euphrates and Tigris, extending somewhat to the east of the latter, and from about the latitude of Baghdad to the head of the Persian gulf, which has receded since ancient times. Its main centre was apparently the region of Nippur, the seat of the chief Sumerian cult. To the north, in the country later called Akkad, a Semitic language prevailed from very early times. Of the race or original home of the Sumerians nothing can be confidently asserted, for they appear settled in this territory from the earliest intelligence we have of them, and their own tradition of a fabulous antiquity gives no hint of another home. In this habitation they invented (for there is no evidence of borrowing) the pictorial script which became by a long process of evolution the cuneiform signs, later adapted by the Semites for the writing of their own language. The year 3500 B.C. may be taken as a round date for the beginning of this script, the development of which can now be somewhat exactly observed, from definite pictures into the purely conventional groups of wedges with which it ended in about the last century before Christ. Very early the stage was reached at which signs were used not only to express the idea which they represented as pictures, but also for the mere sound of the corresponding word in a context which did not involve the actual idea at all; thus the sign *ka* is the picture of a mouth, but it is also used to write a certain grammatical ending *-ka* which has nothing to do with the idea of "mouth." The Sumerian writing, then, is a mixture of pictorial and phonetic elements, the roots being generally written with a sign which in itself expresses the required idea, accompanied by other signs used simply to supply the grammatical modifications. Two difficulties are caused by the polyphony of signs, and the existence of homonyms; one picture (*e.g.* the "foot") having been used to express two connected but different ideas (*e.g.* the "foot" itself, and "to go"), two phonetic values, or more, became attached to the sign. On the other hand the language possessed many words, of different meanings, which chanced to be of similar sound, (*e.g.*, the word *sig* was both "low" and "to strike"). In modern works these homonyms are usually distinguished by diacritical marks. Certain of the signs are also used as determinatives, *i.e.*, they are placed before or after words to assign them to a particular class of natural things, such as man, bird, fish, wood and several more.

Outline of Grammar.—The roots of the language are generally monosyllables though a few longer words are found. These roots are not subject to internal change, since grammatical distinctions are made by grouping a number of elements together around the root, not by causing the root to assume different forms. In the case of roots having the form consonant-vowel-consonant the final consonant is often dropped when a consonant immediately follows. In itself the root expresses a bare idea only; thus *dug* means "good," and can appear not only as an adjective but (with the appropriate modifying elements) as a noun "goodness," or a verb "to be good." Nouns are mostly formed by adding prefixes, sometimes the vowels *a* or *u*, but more often *nam* or *nig* which form abstracts; thus, from *dug*, the noun "goodness" would be *nam-dug*. Sumerian has no gender, which is disregarded in places where it is indifferent and expressed where necessary either by prefixing the determinatives for "male" and "female" or by the use of entirely different words, such as *adda* "father" and *ama* "mother." Plural of nouns is not always indicated, but can be formed when required either by repeating the root (*kur* "land," *kur-kur-ra* "lands"), or by the addition of suffixes *-ene* (used of persons), *-mesh* or *hi-a*. There is no special form of the dual, though the number two can be written if essential. The relation in which the noun stands to the rest of the sentence is shown by a rather elaborate set of suffixes, which may be treated either as postpositions or case endings. Of these *-a* generally expresses the accusative, *-e* the nominative, *-da* is "with," *-ta* "from," *-ra* and *-shu* "to," *-gim* "like," while the genitive is denoted by a suffix *-ak*, which has the peculiarity of doubling itself to correspond with the number of genitives to be expressed, though this doubling is often concealed by the omission of a final consonant. Finally, the noun always stands at the head of a complex of modifying elements, with which it combines to form a kind of composite unity.

A peculiarity of the verbs is that, besides the simple roots, there are also compounds formed by the prefixing of a noun, the whole making one idea (*e.g.*, *de* "to pour" and *gu-de* "to pour out a voice, to speak"). Between the nominal and the verbal part of the compound root are placed such of the accompanying elements as normally precede the root. These accompanying elements may be classified into three kinds (*a*) subject prefixes, (*b*) conjugating elements and (*c*) infixes. The first merely indicate the subject, not expressing in themselves either number or person, and the force of the individual prefixes is still insufficiently clear. Distinction of tense, number, person, mood and voice is effected by the conjugating elements, but the resources of the language for these purposes are not highly developed, and it is clear that some of the grammatical tablets compiled by Semitic scribes for their own use lent to the Sumerian verb a number of artificial refinements which are not observed in the native texts. Extensive use is made of participial constructions, and there is a special form for the optative, and a corresponding prohibitive particle. The infixes, which convey the direct or indirect object, as well as certain adverbial relations, are included in the verbal

forms as the result of a strong tendency for the predicate to gather into itself parts representing all the other members of the sentence. The order of elements in the verb-complex follows a strict rule. The numeral system was sexagesimal and decimal.

The native grammarians knew of five different "tongues" in Sumerian. These are assumed to have been dialects, but in fact nothing is known of them except the *eme-sal* "broad (?)-tongue," in which a number of religious texts are composed. This is differentiated from the ordinary form chiefly by a weakening of certain consonants, particularly of *g* into *m*, and by a preference for phonetic writing. Sumerian ceased to be spoken before 1500 B.C., but was long used as a learned language.

SUMER IS ICUMEN IN, famous 13th century English rota or round which occupies a unique place in the history of music as standing so entirely alone in respect of the advanced character of its writing, as well as of its musical beauty, among the compositions of its period. As Father Anselm Hughes has put the matter in Grove's *Dictionary of Music,* this astonishing composition is pre-eminent in six respects, for (1) it is the oldest known canon; (2) it is the oldest known harmonised music which is frequently performed and enjoyed by singers and listeners to-day; (3) it is the oldest known 6-part composition; (4) it is one of the oldest known specimens of the use of what is now the major mode; (5) it is the oldest known specimen of ground-bass; (6) it is the oldest known manuscript in which both secular and sacred words are written to the music. The generally accepted belief is that it was composed somewhere about the year 1240, and it is ascribed to one John of Fornsete, who wrote the ms., which came from Reading Abbey. *See* article MUSIC, section 3, where the music is reproduced.

SUMMANUS, properly an epithet (= "highest") of Jupiter (q.v.); afterwards god of the nocturnal heavens, thunderstorms at night being attributed to him, those by day to Jupiter. Summanus had a temple at Rome near the Circus Maximus, dedicated at the time of the invasion of Italy by Pyrrhus, king of Epirus (278). Here sacrifice was offered every year to Summanus on June 20, together with cakes called *summanalia* baked in the form of a wheel.

See G Wissowa, *Religion und Kultus der Romer,* p. 122 (1912); W. W. Fowler, *The Roman Festivals,* p. 160 (1899).

SUMMARY JURISDICTION. (1) **Meaning:** The phrase is now understood in English law as referring to jurisdiction, exercised by justices of the peace, which may result in a summary conviction or order. Blackstone divides the proceedings in courts of criminal jurisdiction into two kinds. summary and regular: and by regular he means such as involve trial by jury, the only mode of trial known to the Common law except in the case of contempt of court. In these regular proceedings there is only a preliminary hearing before justices, followed by either a dismissal or committal for trial by jury at Quarter Sessions or Assizes.

(2) **History.**—Being unknown to the Common law, this jurisdiction is entirely the creation of statutes. A brief sketch is to be found in Stephen's *History of the Criminal Law,* vol. 1. ch. 4, of the growth of the criminal jurisdiction. Speaking generally this growth has shown itself in two distinct forms: (a) The conferring of exclusive jurisdiction in a vast number of minor offences, mainly involving the infliction of pecuniary penalties, under such headings as Army, Game, Highway, Licensing, Motor Cars, Merchant Shipping, Post Office, Public Health, Revenue and Vagrancy. These offences have been created and are being created by Acts of Parliament or by by-laws of county councils or other local authorities made under statutory authority, or by orders of Departments. (b) The providing in indictable cases of a mode of trial, alternative to trial by jury and dependent for its adoption on the consent of the tribunal, of the accused and in some instances of the prosecution. These cases are referred to as indictable cases triable summarily.

In addition to summary criminal jurisdiction, justices have been endowed by many statutes with a summary civil jurisdiction of increasing scope and importance.

(3) **General Legislation.**—A court of summary jurisdiction is defined by the Interpretation Act 1889 as "Any justice or justices of the peace or other magistrate by whatever name called, to whom jurisdiction is given by or who is authorised to act under the Summary Jurisdiction Acts and whether acting under the S. J. Acts or any of them, or under any other Act or by virtue of his commission or under the Common Law." This does not apply to justices sitting as the licensing authority nor to the preliminary hearing by justices of indictable offences.

In the Interpretation Act "The Summary Jurisdiction Acts" means the S. J. Act 1848 and the S. J. Act 1879 and any Act past or future amending those Acts or either of them: thereby including amongst others, the Criminal Justice Administration Act 1914 and the Criminal Justice Act 1925. (*See* S.J. Act 1848 s. 35; S.J. Act 1879 s. 54 and C J.A. Act 1914 s. 32 [i.]) These Acts prescribe the constitution of the courts and the procedure to be followed up to, during and following the hearing, in such civil cases as are not otherwise specially provided for, in purely summary criminal cases and in indictable cases triable summarily, and further specify what indictable offences are triable summarily, and the maximum punishment which can be inflicted on conviction. Rules made under these Acts of 1915 and 1926 deal with such matters as the register, accounts, payments and bail.

(4) **Constitution of the Courts.**—A court consisting of not more than one justice has a jurisdiction limited to receiving an information or complaint, issuing a summons or warrant (S J. Act 1848 s. 1), adjourning the hearing to the next practicable sitting of a Petty Sessional Court, and where authorised by the statute creating the offence, trying the case and imposing a punishment of not more than 14 days imprisonment or a fine of not more than 20/–(S J. Act 1879 s. 20).

A Petty Sessional Court is defined by the Interpretation Act 1889 as "A court of summary jurisdiction consisting of two or more justices when sitting in a Petty Sessional Court, and shall include the Lord Mayor of the City of London and any Alderman of that city, and any metropolitan or borough police magistrate or other stipendiary magistrate, sitting in a court-house or place at which he is authorised by law to do alone any act authorised to be done by more than one Justice of the Peace." It is by this court that summary jurisdiction must ordinarily be exercised (S.J. Act 1879 s. 20 [9 and 10])

The position in London (excluding the city) is peculiar. Under the Metropolitan Police Courts Act 1839, a number of stipendiary magistrates (commonly known as police magistrates) are appointed and sit at 14 police courts. The jurisdiction of the justices for the county of London was not expressly taken away, and in theory they possess a concurrent jurisdiction, but inasmuch as by S. 42 of the Act of 1839 court fees in respect of proceedings elsewhere than in the police courts were prohibited, a practical obstacle was interposed which has prevented the jurisdiction being exercised except to a very limited extent. It is not suggested that thereby any public mischief has ensued. Outside London, some 17 stipendiary magistrates are appointed under various statutes for various cities and boroughs.

Offences under the Conspiracy and Protection of Property Act 1875 are to be prosecuted before, and jurisdiction under the Law of Distress Amendment Act 1908 is to be exercised by, a stipendiary magistrate where there is one

(5) **Subject Matter of Criminal Jurisdiction.**—(a) *Summary Cases:* It has been already stated that *inclusive* summary jurisdiction has been conferred in numerous criminal cases both by or under special statutory authority: this statement requires qualification.

(i.) When the offence is punishable by imprisonment for more than three months the person charged may claim to be tried by jury: to this there are at least two exceptions: a male person who knowingly lives wholly or in part on the earnings of prostitution or who in a public place persistently solicits or importunes for immoral purposes. Punishment: 6 months' hard labour, with-

out right to trial by jury (Criminal Law Amendment Act 1912 S. 7 [2]).

(ii.) A like claim to the trial by jury may be asserted under the Explosives Act 1875 S. 92, and the Conspiracy and Protection of Property Act 1875 S. 9.

(iii.) Some offences are triable either summarily or by indictment, *e.g.*, assault, some forms of public indecency, cruelty to children and the offences mentioned above under C.L.A. Act 1912.

(b) *Indictable Cases Triable Summarily:* Where an adult is charged with one of the offences specified in the second schedule to the Criminal Justice Act 1925 and the court thinks it is expedient and the accused consents, the court may try the case summarily, unless the case affects the property or affairs of His Majesty or of a public body, or unless the Public Prosecutor is prosecuting, in which cases the consent of the prosecutor is also necessary. (C.J. Act 1925 S. 24.)

This statute greatly increases the number of indictable offences triable summarily, and confers wider, though more elastic, powers of punishment than any previous statute. The power to fine, which is particularly appropriate in some cases of dishonesty is not possessed by courts of Quarter Sessions or Assize when dealing with felonies.

(6) **Criminal Procedure.**—(a) *Procuring the Attendance of the Accused:* Where the offence is originally indictable, the accused is brought before the court either on arrest without warrant or upon warrant or summons under the Indictable Offences Act 1848, and the charge cannot proceed in his absence.

In summary cases, unless there has been an arrest by a constable under statutory powers, information is laid before a justice as to the offence, whereupon either a summons or a warrant may be issued. For a summons the information may be oral and unsworn; for a warrant it must be in writing and upon oath. The information must be laid within six months from the commission of the offence unless a different time is limited by some particular statute (S.J. Act 1848 S. 11) or unless the offence is a continuing one.

A warrant is not ordinarily granted in the first instance, except for a serious offence; but if the summons is disobeyed, a warrant may be issued upon proof of service.

(b) *The Hearing:* The hearing must take place in open court, and parties may appear by counsel or solicitor. If the accused does not appear and the court determines to proceed, the case must be proved in the ordinary way as if he had appeared. If the informant does not appear the case is dismissed, unless the court thinks proper to adjourn the hearing and to remand the accused either in custody (which would be very unusual) or on recognizance with or without surety. If the accused appears, he is asked to plead; if he pleads guilty, the court proceeds to judgment. If the accused pleads not guilty, the prosecutor opens his case and his witnesses are sworn, examined, cross-examined and re-examined.

A police officer of whatever rank has no right *ex officio,* and should not be permitted to act as advocate or to take any part in the proceedings at all; that is, unless he is the actual informant: even in the latter event, whatever his actual right under the S.J. Act 1848, his activities should be confined, so far as possible, to those of a witness. The attendance of a witness may be enforced either by a Crown office *subpoena* or by a summons or warrant of a justice.

If there is a variance between the evidence and the information, and the party charged is prejudiced thereby, an adjournment on terms should be granted. At the close of the evidence for the prosecution, if the court is of opinion that there is a case to answer, the defendant may open his case and call his witnesses, subject to this: that if the defendant be the only witness on his side as to fact, he must be called immediately after the close of the evidence for the prosecution.

(c) *The Judgment:* The judgment follows the opinion of the majority of justices present at the hearing, and the chairman has no second or casting-vote. In the case of an equality of votes, unless a justice withdraws his vote, the case should be adjourned for a rehearing before another court, when, if the same result ensues, the case should be dismissed. If the court decides to dismiss the information either upon the non-appearance of the informant or as being of opinion that the charge is not proved, it makes an order to that effect and may award costs to the defendant: but costs do not follow the event so frequently as in civil cases. If the charge is without foundation and the defendant is in no way to blame, there seems no reason why he should bear any part of the costs of the defence, whether the prosecution is by the police or by a private person, but a variety of considerations, generally unstated, influence the courts in this matter, and it cannot be pretended that there is any general or settled practice. If the defendant has pleaded guilty or the court is of opinion that the charge is proved, the court may either:

(i.) Postpone judgment (either for consideration or to avoid inflicting sentence of imprisonment) and remand the defendant either in custody up to 8 days, in an appropriate case, or for that or a longer period, on recognizance, with or without sureties, or

(ii.) Convict the defendant, and commit him to the Assizes or Quarter Sessions in order that a sentence of detention in a Borstal institution may be passed, or

(iii.) Convict and sentence the defendant. The maximum term of imprisonment and the maximum fine which can be inflicted are in general fixed by the statute or bye law creating the offence: an order for costs can be included in the conviction. Whatever the provisions of the statute, or bye law, the imprisonment may be either with or without hard labour, and the court may reduce the term as it thinks fit or substitute for imprisonment (where no power to fine existed) a fine not exceeding £25 and not involving, on default, a longer term of imprisonment than that prescribed by the Act or bye law: and where a fine is prescribed, the court may, if it is imposed as in respect of a first offence, reduce the prescribed amount, or

(iv.) Without proceeding to conviction, where the court is of opinion that having regard to a variety of circumstances (*see* Probation of Offenders Act 1907 S. 1) make an order dismissing the information or charge, or discharge the defendant conditionally on his entering into a recognizance, with or without sureties, to be of good behaviour and to appear for conviction and sentence at any time within not more than 3 years.

(d) *Execution and Enforcement of Payment of Fines and Costs:* Fines and costs, ascertained by conviction, are enforced by warrant of distress and, in default of distress, imprisonment on a scale set out in S. 5 of the S.J. Act 1879. The court may issue a warrant of commitment in the first instance if the defendant has sufficient means to pay or if he does not ask for time to pay or has no fixed estate within the jurisdiction or for other special reasons. (*See* further C.J. Act 1914 S. 25.) Where no fine has been inflicted but costs have been ordered to be paid either by the defendant or, upon dismissal, by the informant, recovery is by distress under S.J. Act 1848 S. 18 and C.J. Act 1914 S. 25. There are exempt from distress: the wearing apparel of the defendant and his family, and, to the extent of £5, the tools and implements of his trade. Provision is made in C.J. and S.J. Acts and rules for payment by instalments.

(e) *Appeal:* (i.) *To Quarter Sessions:* There is a general right of appeal against a conviction (including an order under S. 1 of the Probation of Offenders Act 1907) where the person aggrieved did not plead guilty (C.J. Act 1914 S. 37 [1]: C.J. [Amendment] Act 1926 S. 1), and against sentence after a plea of guilty (C.J. Act 1928 S. 25). There is no right of appeal against a dismissal, unless specially given by some statute. The procedure is regulated by the S.J. Act 1879 to which reference should be made to master the technicalities which are numerous.

(ii.) *To the High Court by a Case Stated on a Point of Law:* Such an application may be made by either party under the S.J. Acts 1857 and 1879. A recognizance, similar to that required on appeal to Quarter Sessions, is necessary. Generally speaking, the parties agree upon the form of the case: failing agreement the court settles the case.

(iii.) The court of King's Bench has further powers, on certain limited grounds, to restrain or control the exercise of a refusal to refuse to exercise jurisdiction by writ of *certiorari mandamus*

and *prohibition.*

(7) **Civil Procedure.**—(a) As before stated, justices have been authorised by many statutes to make orders for the payment of money or otherwise. and some of the statutes contain special provisions as to the procedure to be observed. Mention is made of those most in use Bastardy is specially dealt with under the Bastardy Acts 1872 and 1923 and the Affiliation Orders Act 1918.

Disputes between employers and workmen and employers and apprentices are provided for by the Employers and Workmen Act 1875

A special code, applicable to certain differences between husbands and wives, is contained in the S J (Married Women) Act 1895 as amended by the Married Women (Maintenance) Act 1920 and the S J. (Separation and Maintenance) Act 1925 and S 5 of the Licensing Act 1902.

A limited jurisdiction in ejectment is conferred on justices by the Small Tenements Recovery Act 1838, at present qualified by a variety of Rent Restriction Acts

In the absence of provision to the contrary in the Act conferring jurisdiction, the procedure is governed by such parts of the S.J. Acts and rules as deal with orders and the recovery of civil debts. A summons is issued on complaint and not on information, and no warrant can be issued to compel attendance On the hearing the civil laws of evidence apply To enforce an order for the payment of a civil debt or costs, in default of distress, a judgment summons, of which personal or substituted service is necessary, must be obtained If on the hearing of this summons it is proved that the defendant has or had, since the date of the order, means to pay, he may be committed for any term not exceeding 6 weeks. (S.J. Act 1879 S 35) Default in complying with an order other than for payment of money may be visited by an order to pay a sum (to be enforced as a civil debt) up to £1 a day during default, not exceeding £20 in the aggregate, or for imprisonment, until compliance, for a period not exceeding two months

(b) *Appeal:* There is no general right of appeal to Quarter Sessions: in Bastardy, however, either party may so appeal, and various other statutes conferring civil jurisdiction include this right For instance the Pawnbrokers Act 1872 (on refusal of a certificate) and the Money-Lenders Act 1927. In matrimonial cases a special form of appeal lies to the High Court, Probate, Divorce and Admiralty Division.

The S.J. Acts 1857 and 1879 as to appeal by stated case apply to civil determinations in like manner as they do to criminal determinations, and the powers of the High Court as to writs of *certiorari, mandamus* and *prohibition* can also be invoked

(8) **General Observations.**—The public advantage of the courts is not confined to the work done in open court The stipendiary magistrates, in London especially, act as friendly advisers of the poor, who flock to the courts for counsel and assistance. Many difficulties are solved, quarrels composed, and redress secured by extra-judicial methods

It must be confessed, however, that occasionally the need is felt for some further provision for the defence of the needy and ignorant persons in these courts Societies for the protection of women and children play their part, the magistrate does what he can and even has been known to instruct a solicitor for the defence at the expense of the poor box. Yet still there is a gap to be filled, and it seems probable that, sooner or later, some scheme, however closely limited and guarded, will have to be devised to prevent possible injustice. (H W W WIL)

THE UNITED STATES

Summary jurisdiction in the United States, as in England, is the creation of statutes. The American colonists were familiar with the institution of summary jurisdiction as developed in Stuart England and adapted it to the exigencies of their new life. Reasons such as their distrusts of bureaucratic tyranny, the lack of trained lawyers, the limited need for criminal legislation, made for a reduction in the extent of summary jurisdiction. That a vigorous and extensive jurisdiction over minor offences was exercised is, however, clear. (*See* Frankfurter and Corcoran, Petty Federal Offenses and the Constitutional Guaranty of Trial by Jury, 39 Harvard L. Rev. 917, 1926.) Some of the colonies gave general summary jurisdiction of all offences where the maximum punishment was a moderate fine and a moderate term of imprisonment. Special legislation conferred summary jurisdiction for petty offences such as swearing, gambling, illegal selling of liquor, profiteering, etc. The extent of this jurisdiction as being "a veritable social control in the daily lives of the people" is demonstrated by the fact that prior to the American Revolution the number of offences punished in the first instance by a single magistrate in Massachusetts amounted to 170, a figure equally illustrative of the extent to which summary jurisdiction prevailed in the other colonies.

Prior to the Revolution much antagonism was aroused by the Crown's denial of the right to trial by jury in a number of cases where traditionally such trial was had. This grievance of the colonists loomed large in the Declaration of Independence of 1776 and was responsible for the inclusion of provisions in the United States and State constitutions guaranteeing the right to trial by jury. The relationship of these constitutional provisions to the recognized summary jurisdiction of the magistrates has proved a controversial issue in American law It is quite clear, however, that their effect was not to introduce jury trial in all cases but that, whatever restrictions they placed upon the statutory extensions of summary jurisdiction, they left the existing ambit of that jurisdiction, in the main, untouched. The history of that jurisdiction has controlled the courts in determining the scope of the constitutional provisions for trial by jury. Thus, the constitutional provision has been interpreted by various courts as not to deny the power of the legislature to confer summary jurisdiction upon magistrates in a variety of petty offences such as assault and battery, disorderly conduct, petty larceny, violations of game, food inspection, liquor, vagrancy, Sabbath-breaking and highway laws The test of what offences can be entrusted to the summary jurisdiction of single magistrates has been framed by the New Jersey court of errors and appeals in Katz *v* Eldridge, 97 N.J L. 123, 151. (1922), as follows. "The offence must be a petty and trivial violation of regulations established under the police power of the State in order that the offender may be summarily tried, convicted, and punished without indictment by a grand jury and without trial by a petit jury It must, of course, be assumed that the punishment for such a petty and trivial offence will also be comparatively petty and trivial, otherwise it would violate another provision of the State constitution which prohibits cruel and unusual punishments."

The constitutional problem arising from the guarantee of jury trials is present to a less degree in the grant of summary jurisdiction in civil cases In some States the constitutional provision is expressly limited to criminal cases. In those where it includes civil causes its interpretation has followed the historical manner given to the provision applicable to criminal jurisdiction. To increase summary jurisdiction without infringing upon the constitutional right to jury trial, statutes commonly provide that unless such trial is expressly demanded by the defendant at a certain stage of the proceedings the magistrate is empowered to proceed as if the case fell within his summary jurisdiction.

The extent to which magistrates exercise summary jurisdiction varies with the statutes of each State. In criminal matters it is exercised only in the broad class of petty offences. The furthest extent to which this classification has been enlarged concerned the breach of a State liquor law where the penalty prescribed amounted to a fine of $500 and six months' imprisonment. No summary jurisdiction has as yet been conferred upon the judicial officials of the Federal Government. Federal crimes are limited

in character and of such a grave nature as would traditionally call for the benefit of a jury trial. The recent prohibition amendment to the United States Constitution and the legislation thereunder punishing the manufacture, sale and transportation of intoxicating liquor has, however, thrust upon Federal courts a large amount of trivial criminal business and brought to the forefront the desirability of establishing some system for Federal summary jurisdiction. In civil matters magistrates exercise a large summary jurisdiction. The abatement of nuisances, the collection of taxes, the enforcement of liens, actions upon official bonds, *quo warranto* proceedings, the enforcement of awards, bastardy proceedings, are examples of classes of cases commonly entrusted to single magistrates. In ordinary civil actions upon contracts, promissory notes, torts and the like, summary jurisdiction is conferred provided that the claim does not exceed a certain pecuniary limit. Actions involving title to real property are generally excluded from grants of summary jurisdiction.

The procedure in summary jurisdiction matters is more informal than otherwise. Matters of form are largely dispensed with and great liberality with respect to the proceedings is exercised. Actions are commenced by summons which contains a short statement of the cause of action. No formal pleadings are necessary and in many cases the pleadings are oral, the magistrate's entry showing their substance. Defences are also pleaded orally. Many States, however, require the plaintiff to set out his cause of action in a bill of particulars and require the defendant to file a formal answer. The admission of evidence is governed by general common law principles though less exactness in their application is required. Judgments may be sued upon or executed in the same fashion as other judgments of superior courts. Dockets are required to be kept, upon which a record of the proceedings must be entered. Review of the proceedings is generally accorded by statute by appeal or writ of error within certain limitations as to the amount involved. The review is limited to those issues which were presented to the single magistrate and to the jurisdiction of that magistrate. Provisional remedies of arrest and attachment are also generally conceded to magistrates invested with summary jurisdiction.

(J. M. La.)

SUMMER SCHOOLS. Courses of instruction given at educational centres during the summer vacation. These specialized courses are largely attended by those wishing to increase their knowledge of special subjects, *e.g.*, teaching, music, drama, handwork, etc. Among the earliest summer schools must be mentioned the one carried on at Naas in Sweden and attended by teachers who desired to learn Sloyd as a step to handwork.

GREAT BRITAIN

The progress of handwork in English schools soon led to the establishment of summer courses under the direction of the Educational Handwork Association. In a less specialized field, the University Extension Movement had established summer meetings held alternatively at Oxford and Cambridge. These were attended by many teachers, although designed primarily to meet the needs of students in University Extension classes. The Science and Art Department, now merged in the Board of Education, provided holiday courses for selected teachers in various branches of science; and certain French universities organized summer classes in French language and literature which attracted teachers of modern languages.

Development.—The movement developed rapidly, and the provision of summer schools and vacation courses became extremely liberal, although it did not cover the whole ground. The courses offered present great variety alike in their curriculum, direction, and organization. Some are specialized in character, as, for example, a course dealing with the teaching of Latin; while others aim at supplying teachers in secondary and elementary schools with general information concerning new developments in school organization and method. The Board of Education continues to provide courses for selected teachers who receive a grant and attend lectures and demonstrations in such subjects as rural education, modern languages, science, geography and history. Music also receives considerable attention.

Features of Summer Courses.—A well-arranged course provides opportunities for social intercourse and for free discussion. Some of the most successful courses are held in university towns, where the students live for a time in a college and enjoy the amenities of the playing fields and the river. A very popular course, which is held in London under private auspices, aims at giving to teachers from the provinces and from abroad an intimate knowledge of the chief attractions of London and of hearing addresses from eminent men and women.

Courses for Teachers.—It is now generally accepted that teachers should be encouraged in every possible way to refresh their minds and revivify their work by attending schools and classes, whether in the summer or at some other time. Probably the most complete example of such classes in term time is that of classes arranged by the London County Council, which extend from single lectures or sets of lectures to courses of a year or more, leading to the acquisition of a university certificate, diploma or other degree, such as the geography and history courses at University College, London, and the certificate and diploma course at the French Institute. There is a growing feeling, however, that for many teachers the best refreshment is a complete holiday, and some of the courses arranged are therefore held outside the holiday period, the teachers being granted leave of absence. This plan is held to be justified on the ground that the work of the teacher gains in efficiency and therefore brings a return in public service. In England the practice of giving a "Sabbatical year" has not been widely adopted, although in some universities certain professors or lecturers have been granted leave of absence for a term or more to enable them to pursue definite lines of research. It is increasingly held, however, that some arrangement should be made by which teachers may have the opportunity of bringing their studies up to date. The report of the departmental committee on the training of teachers recommended that teachers of experience should be granted leave of absence in order that they might attend university courses on education, and thereby equip themselves for posts of responsibility in the educational service. (F. Ro.)

THE UNITED STATES

In the United States since the '70s, and more especially since about 1905, there has been a widespread offering of instruction by universities and colleges during the summer months. The universities have been desirous of aiding their students who wish to qualify for degrees as rapidly as possible and especially by continuing during the summer regular study "for credit," and enabling teachers to attend the summer sessions for additional training. Furthermore, quite apart from any question of academic recognition for summer work, there is a nation-wide interest in intellectual improvement. (*See* Adult Education.)

The interest in study as a recreation rather than for credit was satisfied by the earliest programme of summer study, and in 1869 at Harvard university a course in geology was arranged by Dean Shaler. Similar field work in his own subject was offered by Prof. Louis Agassiz of Harvard university in a zoological laboratory established on Penikese island in Buzzards Bay, Mass., in 1873. Provision for lectures on special subjects was made in other places. In 1878 at Martha's Vineyard the first six weeks' course in education for public school teachers was offered. In 1880, Prof. C. O. Whitman established the Marine Biological Laboratory at Woods Hole as a centre for researchers in biology.

Another early form of summer study which has greatly influenced the growth of summer schools was the Chautauqua summer assembly (*see* Lyceums and Chautauquas) which began with a ten-day session in 1874, enlisting the co-operation of many notable scholars and educators. One of these, William Rainey Harper, who conducted courses in Hebrew and in Old Testament literature, became president of the University of Chicago in 1891. Moved by the success of his Chautauqua experience he provided for a university calendar which included four quarters of which the summer one was like each of the others, an integral part of the university year. Shortly thereafter other universities provided for

summer sessions, many of them offering courses which could be counted toward the baccalaureate degree: 1893, University of Nebraska; 1894, University of Michigan; 1896, University of Illinois; 1897, Clark university, Cornell university, Ohio university; 1899, University of California; 1900, Columbia university.

In 1911, the U.S. Bureau of Education reported the existence of 497 summer schools of which 280 granted credit toward degrees. This list, however, included normal schools and other teacher-training institutions. Of 397 institutions which reported to the American Council on Education in 1926, 254 had summer sessions.

A few institutions, because the summer school is an integral part of the university calendar, offer courses in all departments. In 1926 at the University of Wisconsin 149 departments offered 438 courses; at Iowa State college 51 departments offered courses. The number of courses offered is even more significant than the number of departments; certain departments—notably English and Education—increasing their courses through the addition of temporary instructors from other institutions and even enlisting editors, school superintendents and other experts to conduct courses in their special fields. In 1925 Columbia offered 854 courses; Iowa 600; Wisconsin 438; West Virginia 365; Louisiana State 378; Kansas State Agricultural college 372; Massachusetts Institute of Technology 335, University of Indiana 319. Nine others offered more than 200 courses each, and 31 offered more than 100 courses each.

The length of the summer session varies Institutions organizing their calendar on the four-quarter system usually offer a summer quarter between 11 and 12 weeks in length The session at Columbia is six weeks in length. Harvard university offers a five weeks' session.

Enrolment in summer sessions reported for 1925 shows Columbia to be by far the largest with 31,756 students in its 854 courses during six weeks of the summer of 1925. The University of Chicago during its regular summer quarter in 1925 enrolled 6,577 students. In 1926 during a similar period of two six-week terms the University of Minnesota enrolled 6,566. The University of Wisconsin in 1925 in its two terms, one of nine and one of five weeks, enrolled 5,015 The University of California in 1926 enrolled 4,976 Pennsylvania State college, the University of Iowa, the University of Texas, the University of Michigan and the College of the City of New York enrolled more than 3,000 each.

SUMMER TIME: *see* DAYLIGHT SAVING

SUMMIT, a village of Cook county, Illinois, U S A, on the Illinois and Michigan canal, 11 m SW of the Chicago "loop." It is served by the Chicago and Alton and electric railways Pop. 4,019 in 1920 (38% foreign-born white) and the local school census indicated over 8,000 in 1928.

SUMMIT, a city of Union county, New Jersey, U S A, 21 m W of New York city, on the crest of a ridge called Second mountain; served by the Lackawanna and the Rahway Valley railways Pop (1920) 10,174 (21% foreign-born white and 5% negroes) It is a residential suburb, with two private schools and little manufacturing. Summit was incorporated as a township in 1869 and was chartered as a city in 1899

SUMMIT HILL, an anthracite-mining borough of Carbon county, Pennsylvania, U S A, served by the Lehigh and New England railroad, and in summer by a switch-back railway connecting it with Mauch Chunk, 9 m N E. Pop (1920) 5,499 (21% foreign-born white) It has a famous burning mine, which has been on fire since 1832 The Mauch Chunk Switch-Back railway, now used for tourist traffic, was built in 1827 by the Lehigh Coal and Navigation Company for transporting coal, and boasts that it is the oldest railroad in the United States.

SUMMONS: *see* PRACTICE AND PROCEDURE.

SUMNER, CHARLES (1811–1874), American statesman, was born in Boston, Mass., on Jan. 6, 1811. He graduated in 1830 at Harvard college, and in 1834 at the Harvard law school At the age of 23 he was admitted to the bar. The three years (1837–40) spent in Europe were years of fruitful study and experience.

In his 30th year Sumner returned to Boston, to settle down to the practice of law. But gradually he devoted less of his time to practice and more to lecturing in the Harvard law school.

Sumner co-operated effectively with Horace Mann for the improvement of the system of public education in Massachusetts. Prison reform and peace were other causes to which he gave support. He took an active part in the organizing of the Free Soil Party, in revolt at the Whigs' nomination of a slave-holding Southerner for the presidency; and in 1848 was defeated as a candidate for the National House of Representatives. In 1851 control of the Massachusetts legislature was secured by the Democrats in coalition with the Free Soilers, but the Democrats refused to vote for Sumner, the Free Soilers' choice for U.S. senator, and urged the selection of some less radical candidate. A deadlock of more than three months ensued, finally resulting in the election (April 24) of Sumner by a majority of a single vote

In the closing hours of his first session, in spite of strenuous efforts to prevent it, Sumner delivered (Aug 26, 1852) a speech, "Freedom national; Slavery sectional," which marked a new era in American history The conventions of both the great parties had just affirmed the finality of every provision of the compromise of 1850. In 1856, at the very time when "border ruffians" were drawing their lines closer about the town of Lawrence, Kan, Sumner in the Senate (May 19–20) laid bare the "Crime against Kansas." He denounced the Kansas-Nebraska bill as in every respect a swindle, and held its authors, Stephen A. Douglas and Andrew P. Butler, up to the scorn of the world Two days later Preston S. Brooks (1819–57), a Congressman from South Carolina, confronted Sumner in the Senate chamber, denounced his speech as a libel upon his State and upon Butler, his relative, and struck Sumner till he fell unconscious to the floor This assault cost Sumner three years of heroic struggle to regain his health—years during which Massachusetts re-elected him, in the belief that in the Senate chamber his vacant chair was the most eloquent pleader for free speech and resistance to slavery

After the withdrawal of the Southern senators, Sumner was made chairman of the committee on foreign relations (March 8, 1861), a position for which he was pre-eminently fitted by his years of intimate acquaintance with European politics and statesmen While the war was in progress his letters from Cobden and Bright, from Gladstone and the duke of Argyll, at Lincoln's request were read by Sumner to the Cabinet, and formed a chief source of light as to political thought in England In the turmoil over the "Trent Affair," it was Sumner's word that convinced Lincoln that Mason and Slidell must be given up, and that reconciled the public to that inevitable step

Throughout the war Sumner had constituted himself the special champion of the negro, being the most vigorous advocate of emancipation, of enlisting the blacks in the Union army and of the establishment of the Freedmen's bureau The credit or the blame for imposing equal suffrage rights for negroes upon the Southern States as a condition of reconstruction must rest with him

In the impeachment proceedings against Johnson, Sumner was one of the President's most implacable assailants Sumner's opposition to Grant's pet scheme for the annexation of San Domingo (1870), brought upon him the President's bitter resentment Sumner had always prized highly his popularity in England, but he unhesitatingly sacrificed it in taking his stand as to the adjustment of claims against England for breaches of neutrality

Under pressure from the President, on the ground that Sumner was no longer on speaking terms with the secretary of State, he was deposed on March 10, 1871, from the chairmanship of the committee on foreign relations. Whether the chief cause of this humiliation was Grant's vindictiveness at Sumner's opposition to his San Domingo project or a genuine fear that the impossible demands which he insisted should be made upon England, would wreck the prospect of an adjustment with that country, cannot be

determined. Sumner's last years were further saddened by the misconstruction put upon one of his most magnanimous acts. In 1872 he introduced in the Senate a resolution providing that the names of battles with fellow-citizens should not be placed on the regimental colours of the United States. The Massachusetts legislature denounced this battle-flag resolution as "an insult to the loyal soldiery of the nation" and as "meeting the unqualified condemnation of the people of the Commonwealth." For more than a year all efforts—headed by the poet Whittier—to rescind that censure were without avail, but early in 1874 it was annulled. On March 10 against the advice of his physician, Sumner went to the Senate—it was the day on which his colleague was to present the rescinding resolution. That night he was stricken with an acute attack of *angina pectoris,* and on the following day he died.

"The slave of principles, I call no party master," was the proud avowal with which Sumner began his service in the Senate. His was the first clear programme proposed in Congress for the reform of the civil service. It was his dauntless courage in denouncing compromise, in demanding the repeal of the Fugitive Slave Act, and in insisting upon emancipation, that made him a great propelling force in the struggle that put an end to slavery.

See Sumner's *Works* (Boston, 1870–83), and Edward L. Pierce's *Memoir and Letters of Charles Sumner* (Boston, 1877–93). Briefer biographies have been written by Anna L. Dawes (New York, 1892); Moorfield Storey (Boston, 1900); and George H. Haynes (Philadelphia, 1909). *See* also *Charles Sumner, His Complete Works* with an introduction by G. F. Hoar (Boston, 1910); W. G. Slotwell, *Life of Charles Sumner* (1910); A. N. Gimke, *Charles Sumner Centenary.*

SUMNER, EDWIN VOSE (1797–1863), American soldier, was born at Boston (Mass.), and entered the U.S. Army in 1819. He took part in the Black Hawk war and served many years on the frontier. For distinguished action in the Mexican war, he received the brevet rank of colonel. From 1851–53 he served as military governor of New Mexico. At the outbreak of the Civil War (1861) Sumner had just been promoted to the rank of brigadier-general, and was sent to relieve Sidney Johnston in command of the department of the Pacific. The following year, he was recalled to command the 1st Corps of the Army of the Potomac. At the battle of Fredericksburg he commanded the right grand division under Burnside. Upon Hooker's appointment to chief command of the eastern army, Sumner was assigned to command the department of Missouri, and died suddenly, on March 21, 1863, while on his way thither.

SUMNER, WILLIAM GRAHAM (1840–1910), American economist, was born, of English parentage, in Paterson (N.J.), on Oct. 30, 1840. He was brought up in Hartford (Conn.), graduated at Yale college in 1863, studied French and Hebrew in Geneva in 1863–64 and divinity and history at Göttingen in 1864–66, and in 1866–69 was a tutor at Yale.

He was ordained a priest of the Protestant Episcopal Church in 1869, was assistant rector of Calvary Church, New York city, and in 1870–72 was rector of the Church of the Redeemer, Morristown (N.J.). From 1872 to 1909, when he became professor emeritus, he was professor of political and social science at Yale. In 1909 he was president of the American Sociological Society. He died at Englewood (N.J.), on April 12, 1910.

SUMPTUARY LAWS, those laws intended to limit or regulate the private expenditure of the citizens of a community. They have existed both in ancient and in modern States. In Greece, it was amongst the Dorian races, whose temper was austere and rigid, that they most prevailed. All the inhabitants of Laconia were forbidden to attend drinking entertainments, nor could a Lacedaemonian possess a house or furniture which was the work of more elaborate implements than the axe and saw.

At Rome the system of sumptuary edicts and enactments was largely developed, whilst the objects of such legislation were concurrently sought to be attained through the exercise of the censorial power. The code of the Twelve Tables (*q.v.*) has provisions limiting the expenditure on funerals. The most important sumptuary laws of the Roman commonwealth were the following:—

(1) The Oppian law, 215 B.C., provided that no woman should possess more than ½ oz. of gold, or wear a dress of different colours, or ride in a carriage in the city or within a mile of it except on occasions of public religious ceremonies. This law, which had been partly dictated by the financial necessities of the conflict with Hannibal, was repealed 20 years later, against the advice of Cato. (2) The Orchian law, 187 B.C., limited the number of guests at entertainments. (3) The Fannian law, 161 B.C., limited the sums to be spent on entertainments; it provided amongst other things that no fowl should be served but a single hen, and that not fattened. (4) The Didian law, 143 B.C., extended to the whole of Italy the provisions of the Fannian law, and made the guests as well as the givers of entertainments at which the law was violated liable to the penalties. After a considerable interval, Sulla anew directed legislation against the luxury of the table and also limited the cost of funerals and of sepulchral monuments. Julius Caesar, in the capacity of *praefectus moribus,* after the African war re-enacted some of the sumptuary laws which had fallen into neglect. Suetonius tells us that Caesar had officers stationed in the market-places to seize such provisions as were forbidden by law, and sent lictors and soldiers to feasts to remove all illegal eatables (*Jul.* 43). Augustus fixed anew the expense to be incurred in entertainments. Tiberius also sought to check inordinate expense on banquets.

In modern times the first important sumptuary legislation was: in Italy that of Frederick II.; in Aragon that of James I. in 1234; in France that of Philip IV.; in England that of Edward II. and Edward III. In 1294 Philip IV. of France made provisions as to the dress and the table expenditures of the several orders of men in his kingdom. Charles V. forbade the use of long-pointed shoes, a fashion against which popes and councils had protested in vain. Under later kings the use of gold and silver embroidery, silk stuffs and fine linen wares was restricted. In England we hear much from the writers of the 14th century of the extravagance of dress at that period. In the reign of Edward II. a proclamation had been issued against the "outrageous and excessive multitude of meats and dishes which the great men of the kingdom had used, and still used, in their castles." In the year 1336 Edward III. attempted also to legislate against luxurious living, and in 1363, at the same time when costumes were regulated, it was enacted that the servants of gentlemen, merchants and artificers should have only one meal of flesh or fish in the day, and that their other food should consist of milk, butter and cheese. An act of 1444 had regulated the clothing, when it formed part of the wages, of servants employed in husbandry; a bailiff or overseer was to have an allowance of 5s. a year for his clothing, a hind or principal servant 4s., and an ordinary servant 3s. 4d.—sums equivalent respectively to 50s., 40s. and 33s. 4d. of modern money. Another statute was passed in the year 1462 (3 Edw. IV. c. 5) for the regulation of the dress of persons of all ranks. Similar acts to those above mentioned were passed in Scotland also. In 1433 (*temp.* James I.), by an act of a parliament which sat at Perth, the manner of living of all orders in Scotland was prescribed, and in particular the use of pies and baked meats, which had been only lately introduced into the country, was forbidden to all under the rank of baron. In 1457 (*temp.* James II.) an act was passed against "sumptuous cleithing." The Scottish sumptuary law of 1621 was the last of the kind in Great Britain.

SUMTER, THOMAS (1734–1832), American soldier, was born in Hanover county, Va., on July 14, 1736. He served in the French and Indian War, and was present at Braddock's defeat in 1755. Later he removed to South Carolina. After the fall of Charleston in 1780, when his State was ravaged by the British, he escaped to North Carolina, where he took the field as brig.-general at the head of a body of light horse and soon became one of the most active and able leaders of the South. His vigilance and bravery earned for him the sobriquet of "Gamecock." After

successes over the British at Catawba and at Hanging Rock (Lancaster county), he was surprised and defeated by the British general, Tarleton, at Fishing Creek (Chester county). Raising a new force, he defeated Mayor Wemys at Fishdam (Union county) and repulsed Tarleton's attack at Blackstock (Union county) in Nov. 1780. At the time of his death at South Mount, S.C., on June 1, 1832, he was the last surviving general officer of the War of Independence.

See Edward McCrady, *The History of South Carolina in the Revolution* (1901–02), H A. M. Smith, "General Thomas Sumter" in *Magazine of History* (vol 8, 1908, and vol. 9, 1909).

SUMTER, a city of South Carolina, U.S.A., the county seat of Sumter county; 45 m. E S.E., of Columbia, on Federal highway 76 It is served by the Atlantic Coast Line, the Seaboard Air Line and the Southern railways. Pop. 9,508 in 1920 (41% negroes); estimated locally at about 11,000 in 1928. Sumter was founded in 1800, named for General Thomas Sumter, and chartered as a city in 1887. It was the first city to adopt (1912) the commission-manager form of government.

SUMY, a town of the Ukrainian S S R., in 50° 56′ N., 34° 47′ E., on the Isel river, a tributary of the Psiol, and on the railway. It is a grain and beet-collecting centre and has an elevator Its industries include the making of agricultural machinery, sugar refining, woollen, cloth and leather manufacture, and saw-milling. Pop. (1926) 39,782.

SUN. The sun is apparently the largest and brightest, and actually almost the smallest and faintest, of naked-eye stars. The illusion, of course, arises from its comparative nearness—the next nearest star is, in fact, nearly 300,000 times as far away.

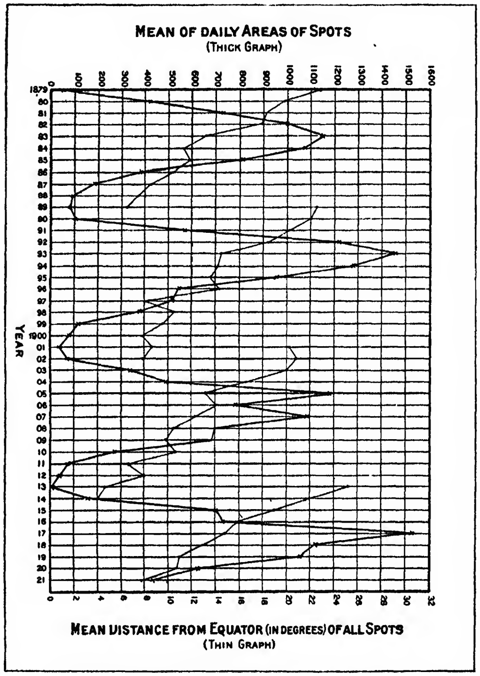
TELESCOPIC INVESTIGATION

General Characteristics.—The sun presents to the telescopic view a dazzling white circular disc, with a sharp edge, whose diameter subtends an angle of about half a degree. Slight but systematic variations of the angular diameter reveal the fact that the distance from the earth to the sun is not constant, and that the earth's orbit is an ellipse with the sun at one of the foci. Several methods have been employed to measure the various distances of the sun from the earth; it will suffice to describe one of them. Early in the 17th century Johann Kepler, by the method of trial and error, discovered rules from which an accurate plan of the solar system could be drawn, although the scale could not be given It then became necessary only to measure at some instant the distance between any two of the bodies represented in the plan in order to fix the scale for the whole. A minor planet named Eros at certain times in its career comes within 14 million miles of the earth, and if its direction be then measured simultaneously from two places at a known distance apart on the earth the distance of the planet can be calculated from the angle between the directions. A scale is thus obtained from which the distance of the sun from the earth at any time follows immediately The mean value throughout the year (from which the actual distance never departs much) is found to be about 92,900,000 miles This is generally expressed by saying that the *solar parallax* is 8″.80 (*i.e.,* 8·80 seconds of arc), the solar parallax being the angle the earth's equatorial radius subtends at the distance of the sun

The sun's linear diameter follows at once from this measurement and the observed angular diameter. It is approximately 864,000 miles—far transcending the powers of imagination, but small as stellar diameters go; the sun is, in fact, a *dwarf* star. Its mass is calculated from the force with which, according to Newton's law of gravitation, it attracts the earth, whose mass is separately determined (*see* EARTH). The result—2×10^{33}gms., *i.e.,* 2×10^{27} tons, or 332,000 times the mass of the earth—is about the average for stellar masses. Mass and diameter are sufficient data for the estimation of the mean density of the sun, viz —1·41 times that of water. This figure, of course, affords no information about the density in any particular region or the rate of variation of density from the surface inwards.

Close examination of the night sky over a prolonged period shows that around the constellation *Hercules* the stars appear, on the whole, to be getting farther apart, whereas, in the opposite direction, they appear to be gathering together. This is interpreted as an indication that the sun, with its attendant satellites, is moving towards a point in the former region.

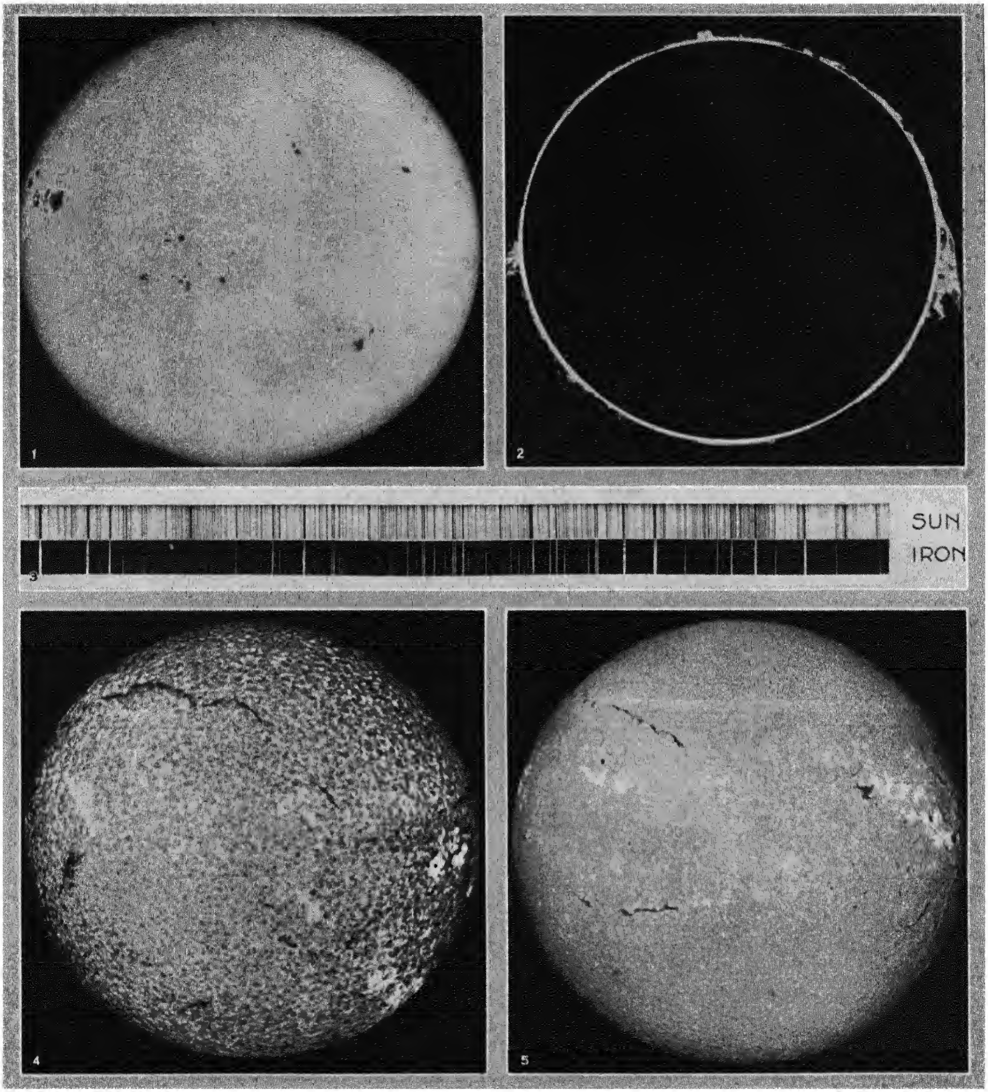
Surface Features.—These general characteristics must now be supplemented by more intimate knowledge. When the surface of the sun is carefully examined it is found to present a grained



GRAPH SHOWING SUNSPOT FREQUENCY AND LATITUDE

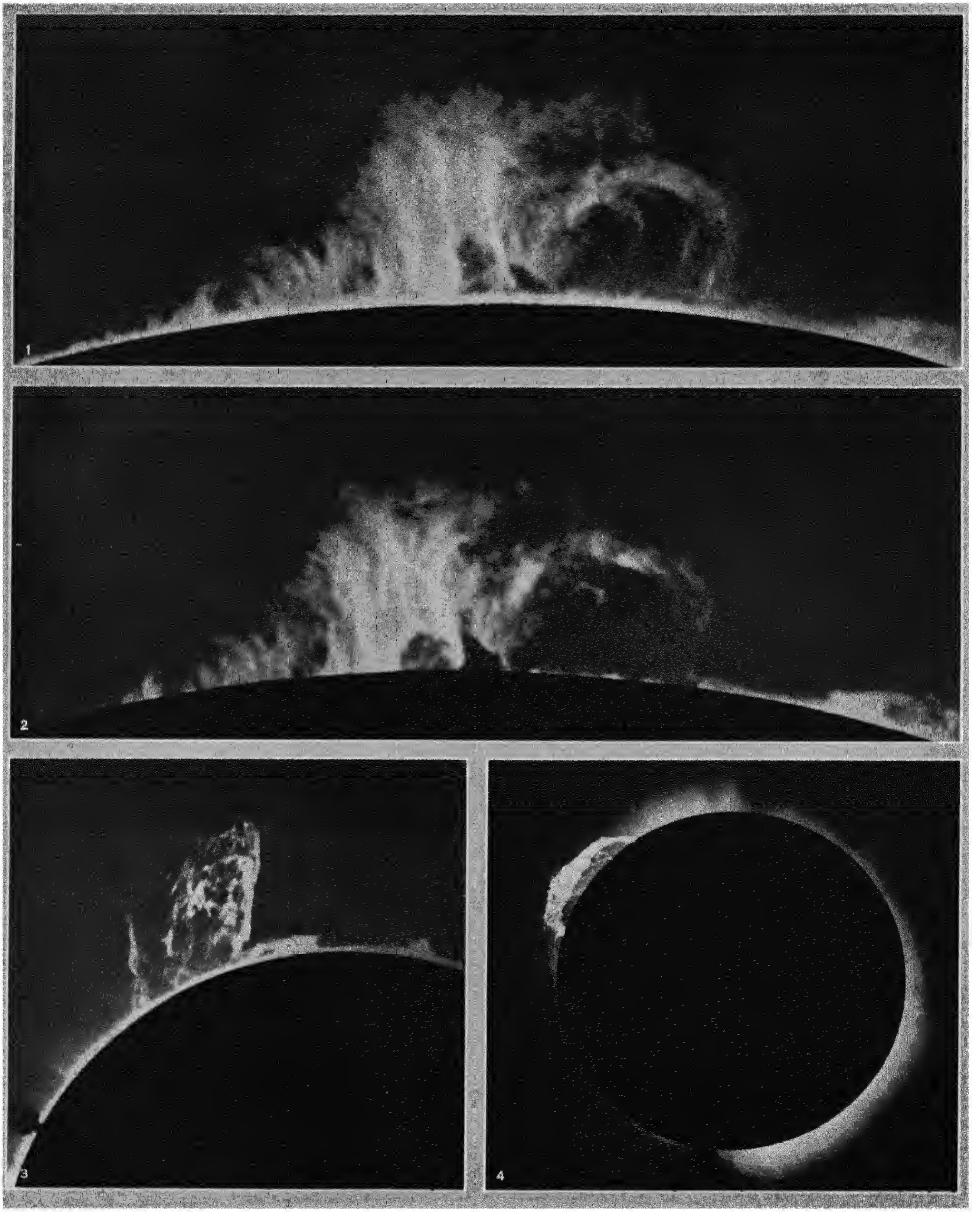
The scale on the left indicates the spotted area with a unit of one-millionth of the Sun's visible hemisphere. During a complete cycle—i.e., from one minimum to the next—the solar latitude at which the spots break out changes in the manner indicated by the thin lines. As the cycle progresses there is a fairly steady approach to the equator, which, however, is never quite reached

structure; the appearance has been likened to that of rice grains and even willow leaves The brightness of the disc in other respects also is not uniform, the region near the circumference, or *limb,* is appreciably less bright than the centre of the disc—a fact which appears most obviously in photographs. More striking violations of uniformity are caused by *sunspots,* which are frequently visible, sometimes even to the unaided eye. A sunspot generally consists of a central, apparently black, *umbra,* surrounded by a less dark *penumbra* (*see* Plate). It should be said at once that each of these regions is in reality exceedingly bright, and appears dark only by contrast with the still brighter solar disc. Spots often cluster together in groups, but perhaps even more significant is their characteristic of associating in pairs. They move steadily across the face of the sun in such a manner as to leave no doubt that the motion is due to a rotation of the sun about an axis. The sun, therefore, like the earth, is approximately a sphere, and its bright visible surface is accordingly known as the *photosphere.* A remarkable feature of the sun's rotation is that it does not take place at the same rate in all latitudes; *i.e.,* the sun does not rotate as a rigid body; the nearer to the equator the faster is the rotation. Sunspots very rarely appear outside two zones of the photosphere, bounded by circles



PHOTOGRAPHIC STUDIES OF THE SUN

1. The photosphere of the sun, showing an unusually large number of spots, faculae, and darkening at the limb (Rutherford)
2. Photograph taken in calcium light, the image of the photosphere having been artificially covered. Shows Chromosphere and Prominences (Evershed)
3. Comparison of solar spectrum with laboratory spectrum of iron (violet region). Presence of iron in the atmosphere of the sun is indicated by coincidence in positions of lines (Imperial College)
4. Spectroheliogram (photograph of sun made by monochromatic light) showing distribution of high-level calcium in the solar atmosphere (Deslandres)
5. Spectroheliogram showing distribution of hydrogen in the solar atmosphere (Deslandres)



BY COURTESY OF (1, 2) YERKES OBSERVATORY, (3) J. EVERSHED, (4) THE ASTRONOMER ROYAL

STUDIES OF SOLAR PROMINENCES

1. Solar prominence observed at Yerkes Observatory, Wisconsin, on October 10, 1910. 2. Another observation of the same prominence made on the same day, also at Yerkes Observatory. 3. Prominences of the sun observed May 26, 1916, at Srinagar, Kashmir, India. 4. The inner corona and prominence photographed at a total solar eclipse, May 29, 1919, observed at Sobral, Brazil. The red flame rose from a height of 130,000 miles to more than 500,000 miles above the surface of the sun in less than seven hours

of latitude about 5° and 40° N. and S. respectively. Within each of these regions R. C. Carrington found, as the result of a large number of observations, that the mean rotation period was 25·38 days, while near the equator the period was only 24·5 days.

Individual sunspots appear spasmodically, remain visible for periods varying from a few days to several months, and then disappear. This apparently capricious behaviour, however, contributes to a striking regularity which is revealed only when large numbers of spots and a great length of time are considered. Samuel Heinrich Schwabe, in 1843, found that if the number of spots appearing per year (or the total area covered by them) were plotted against time, as in the diagram, a markedly periodic relation was shown, the number reaching a maximum approximately every 11⅛ years. It was afterwards discovered that a similar regularity characterized the location of the spots. At a time of minimum those of a new cycle began to appear in the higher latitudes, both north and south, of their appointed belts, and as the cycle progressed the place of outbreak gradually moved towards the equator. The dotted lines in the figure illustrate this.

Sunspots are often accompanied by exceptionally bright areas on the photosphere, known as *faculae.* They are most easily seen near the limb, where the brightness of the photospheric background is diminished.

On the comparatively rare occasions on which the sun is observed in eclipse, red flames are seen apparently rising from various points on the circumference of the dark moon. They belong in reality to the sun, and are known as *prominences.* They are not seen through the telescope alone in full daylight, because the intense photospheric light, diffused by our atmosphere as by a screen of ground glass, acts as a veil through which prominences and stars alike are invisible as individual objects although their radiation contributes to the sum total of the light of day. Prominences assume various shapes and sizes, sometimes reaching heights of hundreds of thousands of miles. On such occasions they can easily be seen by the naked eye during eclipses.

The most striking solar eclipse phenomenon, however, is the *corona,* a pearly white halo enveloping the sun and extending in more or less definite rays or streamers to a distance of several of its radii. The brilliance of the corona diminishes fairly rapidly with distance from the sun's limb, and although its total brightness is not far short of that of full moon, it is still less able than the prominences to maintain the individuality of its appearance in full daylight. No two aspects of the corona seen at different eclipses are identical, but here again the apparent arbitrariness is subject to conformity with a rather vague but unquestionable relation with the sunspot period. At sunspot maximum the corona appears to extend from the sun's limb to roughly the same distance all around. At sunspot minimum, on the other hand, the poles of the sun are marked by comparatively small tufts of light, while from the equatorial regions long streamers shoot out to great distances. There is also a not fully determined relation between the corona and prominences of certain types.

SPECTROSCOPIC INVESTIGATION

General Considerations.—The spectroscope is an instrument by means of which a beam of light is analysed into its constituent colours, or *wave-lengths.* The analysed radiation of a substance is called its *spectrum,* and the instrument is constructed to show each colour radiated as a thin vertical line; hence the term *spectrum line* is often used to denote a particular colour. When, in the laboratory, a substance is vaporised and made luminous, the light it emits, when analysed by the spectroscope, appears as a collection of isolated lines and is characteristic of the substance. On the other hand, a glowing solid, liquid, or gas under great pressure or of great depth, such as is found in the stars, radiates light of all wave-lengths (within rather ill-defined limits), appearing in the spectroscope as a continuous band of colour ranging from red to violet in the order of the colours of the rainbow. This is known as a *continuous* spectrum. Again, when a beam of light which, if analysed, would form a continuous spectrum, is allowed to pass through a less brightly glowing vapour which, acting alone, would give a line spectrum, and is then received by the spectroscope, the spectrum formed consists of a continuous background on which *dark* lines appear exactly in the positions of the bright lines which the interposed vapour would give by itself. This is called an *absorption* spectrum. The glowing vapour absorbs, from the light passing through it, precisely those colours which it can itself emit. Absorption lines are not absolutely dark. They contain the light emitted by the glowing vapour.

The Solar Spectrum.—The spectrum of the sun is an absorption spectrum. This gives us immediately a piece of knowledge which the telescope was powerless to reveal; namely, that the sun has an *atmosphere* of glowing vapours surrounding the brilliant photosphere. Further, it enables us to ascertain the elements which make up this atmosphere by simply comparing the positions or wave-lengths, of the absorption lines with those of the emission lines produced by known substances in the laboratory. In this manner the presence in the solar atmosphere of 66 elements known on the earth (including a few doubtful identifications) has been established. The remaining elements are mainly the heaviest ones, which might be expected to sink to the interior of the sun.

The existence of the solar atmosphere is revealed in another way during times of total eclipse. When the moon has just covered the last remnant of photosphere, the crescent of the atmosphere which still remains exposed for a few seconds gives a bright line spectrum, for the glowing vapours there have no bright photosphere behind them. On account of its evanescence, this spectrum is known as the *flash,* and it is, of course, essentially identical with the *Fraunhofer,* or absorption, spectrum in the positions of its lines. Careful observation at such times enables the heights reached by the various substances to be determined. It is found that the majority are confined to the lowest atmospheric layer, not more than 500 miles high, known as the *reversing layer.* Hydrogen, helium, and calcium charged with positive electricity (*ionised* calcium), however, reach much greater heights, extending up to 8,000 or 9,000 miles, and form a relatively thick upper stratum of the atmosphere, which is known as the *chromosphere* on account of the red colour imparted to it by the glowing hydrogen. Prominences are eruptions of hydrogen.

The portion of the solar atmosphere just outside the sun's limb might be expected to give a bright line spectrum in full daylight. It does not do so, however, because of the diffused photospheric light in the earth's atmosphere which masks the bright radiations. Pierre Jules César Janssen and Joseph Norman Lockyer, in 1868, independently succeeded in partially overcoming this difficulty. If the dispersion of the spectroscope (*i.e.,* its power of separating the colours) is increased, the intensity of the continuous spectrum at any one point is diminished, while the lines in a bright line spectrum are merely drawn farther apart without loss of brightness. Janssen and Lockyer found it possible so to weaken the diffused daylight that the bright lines of the chromosphere and prominences became visible.

When the spectroscope is directed towards the corona, it is found that a great deal of the coronal light yields the ordinary Fraunhofer spectrum and is therefore reflected sunlight. But there is also light which must originate in the corona itself, for it gives a spectrum of which part is continuous and part is composed of bright lines which have not yet been matched terrestrially. The name *coronium* has been given to a hypothetical element which has been held to radiate the lines, but it is now generally believed that coronium is a familiar element in disguise. Elements have a habit of changing their spectra when certain changes are made in the conditions of their radiation.

Spectra and Physical Conditions.—This change of spectrum with change of physical conditions is one of the most important phenomena of spectroscopy. We shall at this stage consider three of its aspects without inquiring into their theoretical foundations. They are, respectively, the effect on a line spectrum of temperature, a magnetic field, and motion of the source of light.

When a luminous compound body is gradually raised in temperature, changes of spectrum of two kinds take place successively. First, the spectrum of the compound gives place to the lines of the constituent elements as the compound becomes dissociated

by heat; secondly, the earliest elementary lines to appear slowly fade out, while new lines come into view and are gradually strengthened Spectrum lines may therefore be roughly classified into "high temperature" lines and "low temperature" lines. These observations have an important application when the spectra of the photosphere and a sunspot are compared. The spectrum of the spot contains evidence of compounds of which only the separated elements contribute to the photospheric spectrum, and, furthermore, the spot spectrum shows a strengthening of "low temperature" and weakening of "high temperature" lines when compared with the spectrum of the photosphere The obvious conclusion is that the vapours over a sunspot have a lower temperature than the rest of the solar atmosphere

A source of light placed in a magnetic field (*i e*, a region such as the neighbourhood of the poles of a magnet, in which a freely suspended compass needle is constrained to lie in a definite direction) has each of its spectrum lines split into a number of component lines, lying side by side Unless the field is a very strong one, the components are too close together to be seen as distinct individuals and the lines merely appear to be broadened. By means of special appliances, however, the existence of the separate components can be detected In 1908 George Ellery Hale, using such appliances, found that the lines in the spectrum of a sunspot were of just the composite character that would result from the existence of a magnetic field in the spot in a direction perpendicular to the sun's surface

Further observation showed that all sunspots are magnets, some presenting a north, and others a south pole to the surrounding space. In each pair of spots, the leader and the follower in the journey round the sun's axis had opposite polarities Indeed, many apparently single spots were found by this magnetic criterion to have invisible companions Moreover, there was a reversal of polarity in the southern solar hemisphere as compared with the northern; thus, if the leader of a pair were a N-pole in the northern hemisphere, it would be a S-pole in the southern hemisphere, and vice versa and, with few exceptions, this order would characterise all spots from one minimum to the next of a sunspot sphere, and vice versa, and, with few exceptions, this order would be reversed, so that the approximate period of a *complete* set of sunspot phenomena turned out to be, not 11 but 22 years.

More refined investigations of the same kind have shown that the sun as a whole is a magnet, just as the earth is Its field, however, is much weaker than that of a spot, being only 50 gausses at its strongest observable region (the base of the reversing layer) as compared with about 4,000 gausses in large spots. (The maximum value of the earth's field is roughly 0·5 gauss)

The third of the effects mentioned above—that of motion of the source of light, or *Doppler effect*, as it is called—has had many and various applications When the distance between an observer and a source of light is decreasing the wave-length of every line emitted is lessened by an amount proportional to the wave-length itself and to the rate of approach When the distance is increasing the wave-length is augmented in a similar manner This shows itself by a displacement of the spectrum lines compared with their normal positions, and the amount and direction of the displacement indicate the velocity of approach or recession

This effect has been used to measure the speed of the sun's motion among the stars. The displacement of spectrum lines, when properly analysed, shows that the solar system is moving at a speed of about 12 miles per second among the stars

Another application of the Doppler effect to the sun is the verification of the speed of rotation by observing the rates of approach of the east limb and recession of the west limb The values obtained agree very well with those indicated by the spots, and the observations can be extended beyond the belts to which the spots are confined. The same spectra can be used for a further purpose; namely, to determine what lines in the solar spectrum are produced by absorption in the *earth's* atmosphere. Our atmosphere, though not luminous, is able, in great thickness, to absorb certain lines (known as *telluric* lines) proper to its constituents, which are mixed with the true solar lines in the ordinary Fraunhofer spectrum. Such lines, however, occupy identical positions in the spectra of the two limbs and are therefore readily distinguished from the displaced solar lines.

One of the most difficult and important applications of the Doppler effect is to the detection of atmospheric currents in the sun itself. Solar storms not infrequently occur, of incomparably greater fury than the hurricanes and tornadoes of the earth, and the violent motions of the solar gases are revealed by distortions and displacements of the spectrum lines. Eruptive prominences are often the results of such storms But there are more systematic movements also which have been brought to light in the same way, and of these perhaps the most interesting are the movements occurring near sunspots. The researches of John Evershed and Charles Edward St. John have shown that in the lower atmospheric levels gases move upwards and outwards from a spot, while in the higher levels the movements are inwards and downwards, as if a spot were a sort of whirlpool into which the high level gases are drawn. Indeed, there is definite evidence of high level circulatory movements round the axes of spots, which point strongly to the same conclusion

SPECTROHELIOGRAPHIC INVESTIGATION

It has been said that the absorption lines in the solar spectrum contain light emitted by the glowing atmospheric gases; it is the *photospheric* light that is absorbed. The spectroheliograph is an instrument which gathers the light in a particular spectrum line and builds up a picture of the solar atmosphere in the light of that line, showing thereby how the substance producing the line is distributed in the solar atmosphere. The construction of the instrument is explained in the article SPECTROHELIOGRAPH. Some of the results which it produces are shown in Plate I., figs. 4 and 5.

It is clear that the evidence of the spectroscope and spectroheliograph points the way to a fairly complete knowledge of solar meteorology, from which it appears that the structure of the solar atmosphere is anything but uniform. Atoms congregate in clouds, or *flocculi*, particularly in the regions of sunspots, where they form the faculae observed through the telescope. Different substances are differently distributed, and the distribution of each substance is in a state of continual flux. The restless turmoil of the solar atmosphere stands in striking contrast to the comparative quietude and regularity of our own air. Yet even in the sun the motions are not wholly chaotic On the large scale there is a consistency which points to a fundamental equilibrium There is a fairly well defined limit to the ascent of each substance above the photosphere; we never find sodium so high as hydrogen, for example Spectroheliograms are markedly characteristic in appearance for each substance; the coarse mottled structure of the calcium clouds is immediately distinguishable from the finer-grained layers of hydrogen, inconstant as each of them may be in detail. Once more there is a foundation of law and order to the superficial irresponsibility

BOLOMETRIC INVESTIGATION

The Sun's Total Radiation.—One of the most important characteristics of the sun is its practice of radiating energy. Of the $3{\cdot}79 \times 10^{33}$ ergs which it discharges every second in the form of light, heat, and other ethereal vibrations, its attendant planets and their satellites receive about one part in 120 million, so that the significance of the process is cosmic rather than human. This enormous quantity of energy is sent forth regularly and ceaselessly, and goes no one knows whither or to what end In seeking further knowledge of this fundamental process the first step to be taken is the measurement of the precise rate of radiation, for which purpose use has been made of various instruments bearing the generic name, *bolometer*.

Owing to natural limitations we can measure only the radiation received by a small area of the earth's surface, but, knowing the dimensions of the solar system, we can readily deduce the total amount. The general method is to convert the sun's radiation into heat, which can be accurately measured—making an allowance, which must be estimated from separate investigation, for absorption by the earth's atmosphere The result is usually ex-

TOTAL ECLIPSE OF THE SUN

The sun in total eclipse at 9 a.m. January 24, 1925, showing the long streamers of the Corona. From a photograph made from High Bridge Park, New York City, overlooking the Harlem River. Although the sun itself is hidden by the moon the Corona gives sufficient light for photographing the landscape

pressed as the *solar constant*, which is defined as the amount of energy which would fall perpendicularly per square centimetre per minute on a surface placed just outside the earth's atmosphere. The value of this constant, according to Charles Greeley Abbot, is about 1·94 calories (81 million ergs), but it is subject to slight variations which are related to the sunspot periodicity and possibly to other factors also. The rate of radiation appears to increase with the prevalence of sunspots, but further observations are required to determine the relation precisely.

The question of the source and maintenance of this ceaseless efflux of energy will be dealt with in a later section of this article. For the present we will limit ourselves to the consideration of the immediate use which can be made of the measurements in the light of ascertained physical principles. It is known that surfaces in a certain condition—known as that of a *perfect radiator* or *black body*—when they radiate energy, do so at a rate strictly proportional to the fourth power of their absolute temperature. There are strong theoretical reasons for believing that the sun radiates as a black body, and its absolute temperature is therefore calculable. Now the sun cannot be uniform in temperature throughout, so that it is necessary to consider what region has the temperature so determined. Since the greatest part of the radiation is in the form of visible light, this region must be the photosphere, and the photosphere is a relatively thin superficial layer at the base of the atmosphere. Thus the temperature measured from the total radiation is that of the outside of the sun. It is called the *effective* temperature, and has a value of 5,750 absolute centigrade degrees.

The Sun's Analysed Radiation.—The bolometer also provides the data for another method of estimating the sun's effective temperature. The radiation from a black body is distributed among the various wave-lengths in its continuous spectrum in a manner definitely related to the temperature of the body. Thus, if the bolometer be passed along the solar spectrum, and the amount of energy at each point in the continuous background thereby measured, the distribution of energy throughout the spectrum may be determined and the absolute temperature deduced. (Allowance must again be made for absorption by the earth's atmosphere, which is not uniform for all wave-lengths.) There are two partially independent methods of analysing the observations to obtain the temperature, which yield the respective values, 6,150° and 5,800°–6,300°. If the sun behaved exactly as a perfect radiator, these determinations would agree with one another and with the result obtained from the undissected radiation. The slight departures from agreement show that the sun is not quite in this condition, but is sufficiently near to it to enable us to say with confidence that the temperature near its surface is about 6,000°.

CONSTITUTION OF THE SUN

Modern View of the Sun's Constitution.—The chief facts concerning the sun which have so far been brought to light are now before us, and the question arises: What idea of the sun do they lead us to form? Following the independent investigations of Arthur Stanley Eddington and James Hopwood Jeans, we think of a vast concourse of broken fragments of atoms in violent movement, held together by gravitational attraction. An atom, it should be remarked, is now pictured as a sort of miniature solar system, in which a number of *electrons*, or units of negative electricity, revolve round a positive *nucleus*. The net amount of positive electricity in the nucleus is, in the normal atom, exactly equal to the sum of the negative charges constituting the revolving electrons, and one element is distinguished from another by the amount of this charge. Thus, the hydrogen atom consists of a nucleus with one unit of positive charge and a single satellite electron; the helium nucleus has two units of positive charge and two satellite electrons; and so on, up to uranium, the heaviest known element, which has 92 units of charge in the nucleus and 92 revolving electrons. By certain methods some of the electrons can be detached, one by one, from their orbits and set free. The remainder of the atom is then said to be *ionised*. Atoms can thus be singly, doubly, and, in general, multiply ionised, according to the number of electrons which are so detached. In such states, however, they are unstable and recapture electrons to make up their deficiency at the earliest opportunity.

Positive nuclei and electrons, then, are the material units of which the sun is believed to be composed. Whether the nuclei are entirely of the kinds existing on the earth, or whether in the interior of the sun there are also heavier ones, is a question on which opinions differ; the direct evidence of the spectroscope, of course, reveals the composition of the sun's atmosphere only. Since the sun is radiating energy, conditions of stability require that it shall get hotter towards the centre, so that the effective temperature of 6,000° represents approximately the *minimum* solar temperature. Now from laboratory experiments and deductions therefrom, we know that high temperature is one of the agencies through which atoms are ionised: the interior of the sun must therefore be pictured as a swarming crowd of electrons and ionised atoms, the degree of ionisation of the atoms and the speed of their motions increasing as the centre is approached. Near the centre, in fact, the nuclei are almost, if not quite, stripped bare of their satellite electrons.

In the ceaseless and inconceivably rapid motions electrons are captured by nuclei and set free again millions of times per second. Both the cause and effect of this process is radiation. Every time an electron is captured the energy of its former motion is liberated as a unit beam, or *quantum*, of radiation; every time a quantum falls on an atom tuned to receive it a satellite electron absorbs its energy and flies into momentary freedom. Ionised atoms, electrons, and radiation thus take part in a process of continual interchange, rapid beyond conception and without pause or diminution of intensity. But there is an important difference in the behaviour of the atoms and electrons on one hand and the radiation on the other. The headlong careering of the former is kept within a limited range by the gravitational consolidation of the whole mass, while electrostatic forces preserve a constant proportion between the number of nuclei and the number of electrons in each region. Radiation, however, is not so controlled. It works its way from the centre, where it is most intense, out to the surface and thence to space at the observed rate of $3{\cdot}79 \times 10^{33}$ ergs per second. The sun loses radiation at this enormous rate, and has been doing so for countless millions of years, while the electrons and atomic nuclei remain chained within its boundaries. How is it possible for the process of interchange to be maintained?

There appears to be only one answer to this question. Electrons and nuclei must in some measure cancel one another, producing fresh radiation by their complete or partial annihilation. Such a process is theoretically possible. It has never been known to occur on the earth, and the only evidence that it occurs in the sun and stars is that otherwise we cannot explain the prodigal generation of radiant energy which those bodies manifest. What conditions give rise to a process which terrestrial circumstances do not countenance is at present an unanswered question.

The picture of the sun which we have so far drawn will fit almost any star, and indeed will be found with greater elaboration of detail in the article STAR. We proceed to particularise for our own luminary. The temperature at the centre of the sun has been estimated at 30 or 60 million degrees, according to the view taken of the conditions of stability and generation of energy. The density at the centre is at least 20 times the mean density. The rate of radiation corresponds to a loss of mass of more than 4,000,000 tons per second—an enormous loss, but one which the sun will be able to sustain, if no sudden change occurs, for millions of years to come.

Application to Detailed Features.—Such, in outline, is the idea which is now held of the sun's constitution. The concepts out of which it is formed are atomic nuclei, electrons, and radiation. If it were complete, the existence of sunspots, prominences and the corona, the sun's rotation, equatorial acceleration and magnetic field, and the phenomena of the atmosphere would follow as inevitable consequences. They do not do so because we have either not yet specified sufficient fundamental concepts or failed to realise the full potentialities of those we have specified. Yet some progress has been made, especially in the consideration of the atmosphere, where, thanks largely to Megh Nad Saha, Ralph

Howard Fowler, Edward Arthur Milne, and Henry Norris Russell, ideas consistent with those applied to the interior have shown how the more prominent of the observed phenomena arise The atom of each element requires a certain amount of energy to detach each of its electrons successively, and the conditions favouring detachment, or ionisation, are high temperature and low pressure Thus the spectrum lines of sodium are produced only up to a certain height because, in the lower pressures above that height, all the atoms of sodium are ionised, in which state they produce different spectrum lines lying outside the range of wave-length which the transparency of our atmosphere allows us to observe The precise connection between the degree of ionisation and the physical conditions has been formulated, and this enables the temperature and pressure in the sun's atmosphere to be estimated from the observed heights reached by the various elements It appears that the pressure in the sun's atmosphere is very low—less than one thousandth of that of the earth's atmosphere—while the temperature is not far below that of the photosphere. When the selective pressure of radiation also is taken into account the relatively great heights reached by the chromospheric gases become intelligible, and in the hands of Milne a consistent theory of the chromosphere is in process of construction (*see* CHROMOSPHERE)

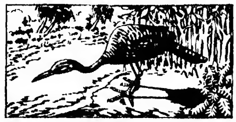
Although there is at present no sign of an explanation of sunspots along the lines of the general solar theory, the work of Hale has greatly clarified our ideas of the nature of those objects. Hale pictures a vortex motion just below the photosphere, in which the revolution of electrified particles produces a magnetic field Photospheric matter is projected upwards along the axis of the vortex, becoming cool by sudden expansion and so appearing darker than the rest of the photosphere This forms the umbra of a spot, and the outspreading and circulation of the material in the atmosphere constitutes the penumbra. Vilhelm Firman Koren Bjerknes has supplemented this view by assuming that during each 11-year cycle there exist, immediately beneath the photosphere, two vortex rings, one in each hemisphere, each lying along a circle of latitude. When, at a certain point, a ring rises up to the photosphere and is intersected by it the two sections of the ring form spots, which thus occur in pairs and appear to have opposite rotations and therefore opposite magnetic polarities Periodic movements of the rings in latitude, occurring as part of a definite system of circulating currents of solar matter slightly below the photospheric level, account for the observed latitudinal migration of the spots This conception is very attractive, but can be regarded at present only as a very plausible hypothesis It remains to be shown how such rings have developed in a sun having the constitution described above.

BIBLIOGRAPHY —The latest authoritative book devoted exclusively to the sun is *Eclipses of the Sun* by S. A. Mitchell (1925); this deals comprehensively with solar observation and theory in a non-technical way. The chapter on "The Constitution of the Sun," by C. E St. John, in the biography of Sir Norman Lockyer (1928) contains a valuable *résumé* of modern ideas For general accounts *see* chapters in *Astronomy*, by H N Russell, R. S. Dugan, and J. Q Stewart (1927), F. J. M. Stratton, *Astronomical Physics* (1925) and H. Dingle, *Modern Astrophysics* (1927). (H. D.)

SUN-BIRD, the name of a group of small birds forming the passerine family *Nectariniidae* They inhabit the Ethiopian, Indian and Australian regions. One species occurs in Baluchistan, which is perhaps outside of the Indian region, but the fact of its being found there may be a reason for including that country within the region They are considered to have their nearest allies in the *Meliphagidae* (*see* HONEY-EATER) Some of them are popularly called "humming-birds" by Anglo-Indians and colonists, but with that group the sun-birds have nothing to do. The most wonderful combination of the brightest colours—scarlet, purple, blue, green and yellow—is often seen in one and the same bird. One group, however, is dull in hue. Graceful in form and active in motion, sun-birds flit from flower to flower, feeding on small insects and nectar; but this is usually done while perched and rarely on the wing as is the habit of humming-birds. The extensible tongue is converted into an almost tubular organ. The nests of the sun-birds, domed with a penthouse porch, and suspended from the end of a bough or leaf, are neatly built.

The Nectariniidae form the subject of a *Monograph* by G. E. Shelley.

SUN-BITTERN (*Eurypyga helias*), a South American bird the size of a small curlew. The plumage is variegated with black, brown, buff, grey, and white; the bill is slender and straight, the legs long. It frequents the banks of rivers and feeds on fish and insects. When alarmed, and also in courtship it displays its wings and tail in a striking way. It inhabits Guiana and Brazil. There is a large species, *E. major*, in Colombia and Central America. Its only ally is the kagu (*Rhinchetus jubatus*) of New Caledonia, a larger bird, with a pendant crest; this has the same habit of display when excited.



THE SUN BITTERN

SUNBURY, a city of Pennsylvania, U.S.A, the county seat of Northumberland county; 40 m (in an air line) N. of Harrisburg, at the confluence of the west and the north branches of the Susquehanna river; served by the Pennsylvania, the Lackawanna and the Reading railways Pop (1920) 15,721 (98% native white), 1928 estimate, 17,000 Sunbury takes the place of the old Indian village Shamokin, long the principal one in the province, where a Moravian mission was maintained from 1747 to 1755 Because of the strategic importance of the spot Ft. Augusta was erected here by the provincial government in 1756, and it was a refuge to many fugitives from the Wyoming Massacre Sunbury was surveyed in 1772 and was incorporated as a borough in 1797

SUNBURY-ON-THAMES, an urban district in the Spelthorne parliamentary division of Middlesex, England, 17 m S W of St Paul's Cathedral, London, on a branch of the S railway. Pop (1921) 5,350. It is a favourite riverside resort and has grown considerably as a residential district. There are pumping works and filtration beds for the water-supply of London To the north-east is Kempton park, the manor-house of which was a royal residence early in the 14th century. The park is famous for its race-meetings, the principal fixture being the Jubilee Handicap, established in 1887 The manor was granted by Edward the Confessor to Westminster Abbey, and passed in the 13th century to the see of London and in the 16th to the Crown; but was not so held later than 1603

SUN CHUANG-FANG (1885-), one of the group of men who rose to prominence and obtained a brief tenure of power in China during the years of strife which succeeded the death of Yuan Shi-kai He was born in Lingcheng in the Province of Shantung and received military training at the Peiyang College and in Japan. In 1921 he obtained command of a Division under Wu Pei-fu, and two years later was appointed military governor of Chekiang During 1924 and 1925 he extended his authority over Kiangsu, and, after defeating the Northern troops, announced the consolidation of five provinces, Kiangsu, Chekiang, Anhwei, Kiangsi and Fukien, into an independent State under himself as governor-general. He made gestures of good-will towards the foreign enclaves within his jurisdiction, and, expressing shame for the insanitary condition of his cities, pleaded for foreign co-operation. Early in 1927 he was swept aside in the advance of the Southern Army, and, in spite of resistance rendered by reinforcements from Shantung, he found himself a fugitive and his five provinces in Nationalist hands. He fought on tenaciously at Hsuchowfu with the remnants of his army, but without success.

SUN COPYING or PHOTO COPYING, the name given that branch of photographic contact printing which is carried out without the aid of a camera-made negative. (*See* BLUE PRINT.)

SUN CURE: *see* HELIOTHERAPY.

SUNDA ISLANDS, the collective name of the islands from the Malay Peninsula to the Moluccas, including the Great Sunda Islands—*i e*, Sumatra, Java, Borneo, Celebes, Banka and Billiton, and the Lesser Sunda Islands, Bali, Lombok, Sumbawa, Flores, Sumba and Timor, etc.

Sunda Strait is the channel separating Sumatra from Java and uniting the Indian Ocean with the Java Sea. Its narrowest part, between the south-eastern extremity of Sumatra and the

town of Anjer in Java, is 14 m. wide. In the middle is the low-lying well-wooded island of Dwars-in-den-Weg ("right in the way"), otherwise Middle Island or Sungian, which divides the strait into two channels each about 4 m. wide. In 1883 Sunda Strait was the scene of the eruption of Krakatoa (*q.v.*), a volcanic island farther west in the strait.

SUNDARBANS or **SUNDERBUNDS,** a tract of country in Bengal, India, forming the seaward fringe of the Gangetic delta. It extends for about 170 m. along the sea face of the Bay of Bengal, from the estuary of the Hooghly on the west to that of the Meghna on the east, and runs inland for a distance of 60 to 80 miles. It is intersected from north to south by large tidal rivers or estuaries, which are connected by numerous interlacing channels. The whole tract is a network of estuaries, rivers and creeks, which enclose a large number of flat, marshy islands. Many are covered with forest and a dense undergrowth standing in soft mud, half in and half out of the water. The area under forest is about 3,000 sq. miles. The characteristic tree is the *sundri* (*Heritiera littoralis*), from which the name of the tract has probably been derived. Along the sea face the forest is composed of mangrove, which in some places are separated from the sea by a line of sand dunes. Cultivation is confined to the north, where over 2,000 sq.m. have been settled, but the population is very sparse. South of the area of cultivation, the Sundarbans are practically uninhabited. The chief wild animals are tigers, of which many are man-eaters, leopards, deer and wild pig; crocodile infest the estuaries.

SUNDAY, the Lord's day in the Christian world, the first day of the week, and the day set apart for divine worship in Christendom, in memory of the Resurrection. Early apostolic writings bear witness to the sanctity of the day dedicated to the duties laid down in the fourth commandment, the equivalent in the Christian religion of the Jewish Sabbath (Saturday). Eventually the Roman emperor Constantine enjoined Sunday rest from labour, except agricultural, by constitutions, the first of which was decreed in A.D. 321, and most of which are contained in the code of Justinian.

English Laws.—In the 7th century A.D. the laws of Wihtred, king of Kent, provided that if a servant, contrary to his lord's command, did servile work between sunset on Saturday evening and sunset on Sunday evening, he should pay a fine to his lord; they forbade a servant to make a journey of his own on horseback on Sunday under penalty of a fine or the lash, and a freeman to work during the forbidden time, under certain penalties including the payment of half the fine to the informer, who also was entitled to the profits of the Sabbath-breaker's labour. On the other hand, Ina, king of Wessex, in the same century ordained that if a slave worked on Sunday by his lord's command he should become free, and the lord be liable to a fine of 30 shillings.

By a series of statutes, many of which are still the law of the country, it is illegal to work or to take part in certain forms of pastime on a Sunday, which in English law is reckoned from midnight to midnight. The first such prohibition in a statute is in 28 Edw. III. c. 14 (repealed) by which in 1354 the sale of wool at the staple was forbidden on a Sunday. Prior to the Reformation Sunday was regarded as a suitable time for national sports, and there were, for instance, a statute in Richard II.'s reign and another in Henry IV.'s reign, which enjoined the practice of archery on that day (*see* SPORTS, BOOK OF). Both Acts were subsequently repealed. Although the church had sufficient temporal power to visit Sabbath-breakers with its displeasure, Sunday observance was not ordained by statute until the reign of Edward VI. by the Act of Uniformity of 1551. By I. Eliz. c. 2 (1558) everyone had to go to church on a Sunday or be liable not only to the censures of the church but to a fine of twelvepence. The penalty was not formally repealed until 1846 (9 and 10 Vict. c. 59). It is still the law of England that members of the Church of England are required to attend divine service on Sunday, and though in practice this law has not been enforced for generations, obedience to the law has been upheld by the High Court in the analogous case of Ascension Day as against a later Act relating to compulsory education attendance (*Marshall and Bell* v. *Graham,* 1907, *2* K.B. 112).

By the Sunday Observance Act 1677 tradesmen, artificers, labourers "or other person whatsoever" are forbidden to carry on their ordinary businesses under penalty of a fine of 5s or two hours in the stocks in default. Acts have been passed to obviate some of the inconveniences in modern life caused by the 1677 Act, which however did permit the sale of milk before 9 A.M. and after 4 P.M., and of victuals in cook shops and fried fish shops (*Bullen* v. *Ward,* 1905, 14 L.J.K.B., 916). Other statutes followed but are all repealed. Still law are the Acts of 1762 (2 Geo. III. c. 15 s. 7), allowing fish carriages to travel on Sunday in London and Westminster; 1827 (8 Geo. IV. c. 75), repealing s. 2 of the Act of 1677 as far as regards Thames boatmen. The Bread Acts of 1822 (3 Geo. IV. c. 106) allow bakers in London, and of 1836 (6 and 7 Will. IV. c. 37) allow bakers out of London, to carry on their trade up to 1.30 P.M. Since an Act of 1871 (34 and 35 Vict. *c.* 87) no prosecution for penalties under the Act of 1677 can be instituted except with the consent in writing of the chief officer of a police district or the consent of two justices or a stipendiary magistrate. (*Thorpe* v. *Priestnall,* 1897, 1, Q.B. 19.)

Since 1871.—The result of the Act of 1871 has been in substance to make the Lord's Day Acts a dead letter as to Sunday trading, and during the present century prosecutions have been extremely rare. In London Sunday markets are usual in all the poorer districts, and shopkeepers and hawkers are allowed freely to ply their trades for the sale of eatables, temperance drinks and tobacco. The Factory and Workshop Act (1901) forbids the employment of women, young persons or children on Sunday in a factory or workshop (s. 34).

Fishing is permissible on a Sunday, except that one may only fish for salmon with rod and line (Salmon Fishery Act 1861). By the Game Act 1831, it is a crime to take or kill game on a Sunday, but the prohibition does not apply to rabbits. The law with regard to Sunday entertainments and performances is based upon the Sunday Observance Act 1781 (21 Geo. III. c. 49) by which heavy pecuniary penalties were imposed upon anyone who promoted any public entertainment or debate to which people were admitted only by payment. As much as a £200 fine could be inflicted upon the keeper of the house or room used, but in 1875 the Remission of Penalties Act was passed to enable the Crown to remit penalties for offences against the Act of 1781.

Sunday is a *dies non* for the sitting of the courts or meetings of public bodies, though parliament has at times sat on a Sunday in national emergencies, and Saturday sittings of the House of Commons have been extended into the small hours of the Sabbath. Process may not be served nor persons arrested except in cases of treason, felony, or breach of the peace (1677 Act), but a justice may issue an arrest or search warrant.

Contracts on a Sunday.—Though at common law a contract made on a Sunday is valid, the technical restrictions imposed by statute on Sunday labour, especially those contained in the Sunday Observance Act 1677, render most contracts made and completed on that day void or voidable (*Smith* v. *Sparrow,* 1827, 4 Bing. 84). But any contract in respect of labour, business, or work not done in the course of a man's ordinary calling is binding. A cheque drawn on a Sunday is binding on the drawer; in an action on a bill of exchange drawn on a Sunday the drawer was given judgment against the acceptor (*Begbie* v. *Levy,* 1830, 1 C. and J. 180). The position in regard to these matters has been clearly laid down by the Bills of Exchange Act.

Computation of Time.—Where any limit or period of time fixed in the High Court exceeds seven days the Sundays included in it (except in divorce proceedings) are counted in computing the time, provided that if the last day fall on a Sunday, the period must be computed so as to cover the next following working day. But where the period fixed is less than six days Sunday is not counted, so that five days from a Saturday would commence on the following Monday and end on the Friday.

In Scotland and the British dominions generally the laws as to Sunday have followed more or less the same course as in England, except that native customs have been interfered with as little as possible and particular Acts have been passed to meet special needs. (W. LA.)

United States.—In the United States Sunday legislation, beginning with an enactment of the Virginia colony in 1617, was quite general in colonial times, and Sunday laws of varying types have been passed by all the States Their general trend is to prohibit the carrying on of any business on Sunday that is neither necessary nor charitable in nature. In some States general provisions to this effect are in force; others prohibit the conduct of particular trades and occupations Many States forbid Sunday sports, prohibiting games and theatrical performances from being conducted for profit Violation of the Sunday laws entails three effects It subjects the violator to the criminal penalty prescribed by statute It makes unenforceable contracts, including promissory notes, executed or to be performed on Sunday In a few States, it subjects the violator to a civil disability, thus preventing a traveller on Sunday from recovering for a negligent injury done to him inasmuch as his own illegal act was a cause of the injury The criminal enforcement of Sunday laws throughout the United States is notoriously lax (J M LA)

SUNDERLAND, CHARLES SPENCER, 3RD EARL OF (c 1674–1722), English statesman, was the second son of the 2nd earl, but on the death of his elder brother Henry in Paris in September 1688 he became heir to the peerage He married Arabella, daughter of Henry Cavendish, 2nd duke of Newcastle; she died in 1698 and in 1700 he married Anne Churchill, daughter of the famous duke of Marlborough. Having succeeded to the peerage in 1702, the earl was one of the commissioners for the union between England and Scotland, and in 1705 he was sent to Vienna as envoy extraordinary Through the influence of Marlborough he was foisted (1706) into the ministry as secretary of state for the southern department. From 1708 to 1710 he was one of the five Whigs, called the Junta, who dominated the government, but in June 1710 he was dismissed

Sunderland was active in communicating with the court of Hanover. He made the acquaintance of George I in 1706, but when the elector became king the office which he secured was the comparatively unimportant one of lord-lieutenant of Ireland In August 1715 he joined the cabinet as lord keeper of the privy seal, and after a visit to George I in Hanover he secured in April 1717 the position of secretary of state for the northern department This he retained until March 1718, when he became prime minister. The South Sea bubble led to his political ruin He had taken some part in launching the scheme of 1720, but he had not profited financially by it; but it was only through the efforts of Walpole that he was acquitted by the House of Commons. In April 1721 he resigned his offices, but he retained his influence with George I until his death on April 19, 1722.

For the career of Sunderland *see* W Coxe, *Memoirs of Marlborough* (1847–48), Earl Stanhope, *History of England* (1853), and I. S Leadam, *Political History of England, 1702–1760* (1909).

SUNDERLAND, ROBERT SPENCER, 2ND EARL OF (1640–1702), English politician, was the only son of Henry Spencer (1620–1643), who succeeded his father William, as 3rd Baron Spencer of Wormleighton in 1636. Henry was created earl of Sunderland in June 1643, and was killed at the battle of Newbury when fighting for the king a little later in the same year He married Dorothy (1617–1684), daughter of Robert Sidney, 2nd earl of Leicester She was the *Sacharissa* of the poems of her admirer, Edmund Waller

Their son Robert, the 2nd earl, was educated abroad and at Christ Church, Oxford, and in 1665 married Anne (d 1715), daughter of John Digby, 3rd earl of Bristol. Sunderland was successively ambassador at Madrid, at Paris and at Cologne; in 1678 he was again ambassador at Paris In February 1679 he entered political life as secretary of state for the northern department, and became at once a member of the small clique responsible for the government of the country He voted for the exclusion of James, duke of York, from the throne, and made overtures to William, prince of Orange, and consequently in 1681 he lost both his secretaryship and his seat on the privy council. Early in 1683, however, through the influence of the duchess of Portsmouth, Sunderland returned to power By this time he had made his peace with the duke of York, and when in February 1685 James became king, he retained his position of secretary, to which was soon added that of lord president of the council. He carried out the wishes of the new sovereign and after the intrigues of a few months he secured the dismissal of Lawrence Hyde, earl of Rochester, from his post as lord treasurer. Sunderland signed the warrant for the committal of the seven bishops, and appeared as a witness against them While he was thus serving James II, he was receiving a pension from France, and through his wife's lover, Henry Sidney, afterwards earl of Romney, he was furnishing William of Orange with particulars about affairs in England. But although he had in 1687 openly embraced the Roman Catholic faith, he hesitated to commit himself entirely to the acts of the fierce devotees who surrounded the king, and in October 1688 he was dismissed by James with the remark "I hope you will be more faithful to your next master than you have been to me"

Sunderland now took refuge in Holland, and from Utrecht published in his own defence *A Letter to a Friend in the Country*. He had been too deeply involved in the arbitrary acts of James II. to find a place at once among the advisers of William and Mary, and he was excepted from the act of indemnity of 1690. However, in 1691, he was permitted to return to England, and he declared himself a Protestant and began to attend the sittings of parliament William III visited him at Althorp in 1691, and it was on his advice that the king chose all his ministers from one political party, the modern system (*See* CABINET) Sunderland also effected a reconciliation between William and his sister-in-law, the princess Anne From April to December 1697 he was lord chamberlain, and for part of this time he was one of the lords justices, but the general suspicion with which he was regarded terrified him, and in December he resigned He died at Althorp on Sept. 28, 1702.

SUNDERLAND, seaport, municipal, county and parliamentary borough, Durham, England, at the mouth of the river Wear, on the L N E railway, 261 m N. from London Pop (1921) 173,696 The borough includes the township of Bishopwearmouth, which lies on the south bank of the river; and that of Monkwearmouth, on the north bank The borough was extended in 1927, its present area being 2,942 ac and estimated population 187,800 Adjacent to Monkwearmouth is the urban district of Southwick, within the parliamentary borough A great cast-iron bridge crosses the river with a single span of 236 ft and a height of 100 ft above low water. It was designed by Rowland Burdon, opened in 1796, and widened under the direction of Robert Stephenson in 1858 The only ancient building is the church of St. Peter, Monkwearmouth, in which part belongs to the Saxon building attached to the monastery founded by Benedict Biscop in 674 The church of St Michael, Bishopwearmouth, is on an ancient site, but was rebuilt in the 19th century. There are six parks in the borough, and four public libraries

The prosperity of Sunderland rests on the coalfields of the neighbourhood, the existence of which gave rise to an export trade in the reign of Henry VII. For 5 m. above its mouth the Wear resembles on a reduced scale the Tyne in its lower course The harbour of 150 ac. is formed by two stone piers It is constantly undergoing improvement and the south pier is now 2,844 ft. long. There is a total length of quayage of 12,000 ft. There are several graving docks (area, 10½ ac), the largest, built in 1925, being 515 ft long The parliamentary borough returns two members.

History.—The history of Sunderland is complicated by the name Wearmouth (*Wiramuth, Wermuth*) being applied impartially to the Monk's town on the north bank of the Wear; the Bishop's town on the south and the neighbouring port now known as Sunderland. In both Monk's and Bishop's Wearmouth the settlement was connected with the church. Benedict Biscop in 674 founded the Benedictine monastery of St. Peter on the north bank of the river. The abbey, where Bede was educated, was destroyed by the Danes and probably not rebuilt until Bishop Walcher (1071–81) settled Aldwin and his companions there. Bishop William of St Carileph (1081–99) transferred monks there from Durham and Wearmouth became a cell of the larger house There seems no doubt that the borough, identical with that

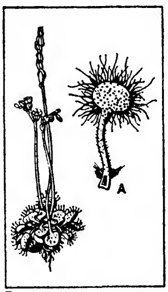
to which Bishop Robert de Pinset granted his charter, was in reality Sunderland, the name Wearmouth being used to cover Bishop's and Monk's Wearmouth and the modern Sunderland. The shipping trade of Bishop's Wearmouth showed a steady increase. In 1382 there was probably a dock here and from the 16th century, Bishop's Wearmouth seems to have been completely identified with Sunderland: in 1567 Wearmouth was one of the three ports in Durham where precautions were to be taken against pirates, while no mention is made of Sunderland. Monk's Wearmouth remained purely agricultural until 1775, when a shipbuilding yard was established and prospered to such an extent that by 1795 five similar yards were at work.

Sunderland was at farm in 1183 and rendered 100 shillings and the town of Sunderland rendered 58 shillings tallage in 1197 during the vacancy of the see. In 1382 Thomas Menvill held the borough. Edward IV. in 1464, *sede vacante,* granted a lease of the borough. Bishop Morton incorporated Sunderland in 1634, stating that it had been a borough from time immemorial, under the name of the New Borough of Wearmouth.

SUNDEW, in botany, the popular name for a genus of plants, *Drosera,* so called from the drops of viscid, transparent secretion borne by the tentacles which cover the leaf-surface. It is a cosmopolitan genus of slender glandular herbs, with leaves arranged in a basal rosette or alternately on an elongated stem, and is represented in Great Britain by three species, and in North America by seven species, found in spongy bogs and heaths. They are included in the family Droseraceae, and comprise about 100 species, most numerous in Australia.

The common sundew (*D. rotundifolia*) has extremely small roots, and bears five or six radical leaves horizontally extended in a rosette around the flower-stalk. The upper surface of each leaf is covered with gland-bearing filaments or "tentacles," of which there are on an average about 200. Each gland is surrounded by a large dew-like drop of the viscid secretion. A small fibro-vascular bundle consisting mainly of spiral vessels, runs up through the stalk of the tentacle and is surrounded by a layer of elongated parenchyma cells outside of which is the epidermis filled with a purple fluid. The glandular head of the tentacle contains a central mass of spirally thickened cells (tracheïds) in immediate contact with the upper end of the fibro-vascular bundle. Around these is a layer of large colourless thin-walled cells which reach the surface at the base of the head and act as absorbing cells. Outside these are two layers filled with purple fluid.

Insects are attracted by the leaves; a fly alighting on the disk, or even only touching one or two of the exterior tentacles, is immediately held by the viscid secretion; the tentacles to which it is adhering begin to bend, and thus pass on their prey to the tentacles next succeeding them inwards, and the insect is thus carried by a curious rolling movement to the centre of the leaf. The tentacles on all sides become similarly inflected, and the insect, bathed in the abundant secretion, is drowned in about a quarter of an hour.



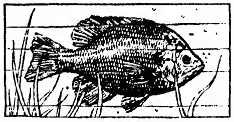
ROUNDLEAVED SUNDEW, (DROSERA ROTUNDIFOLIA) WHOLE PLANT; A. SINGLE LEAF ENLARGED TO SHOW GLANDULAR HAIRS

Closely allied to *Drosera* is *Drosophyllum lusitanicum,* which catches such vast numbers of flies in a state of nature that the Portuguese cottagers call it the fly-catcher, and hang up branches of it in their houses for this purpose. Its long narrow leaves are thickly covered with stalked glands, which resemble in the main the tentacles of *Drosera,* save in that they are incapable of movement, and that the secretion is more fluid. There are many minute colourless sessile glands, which, when stimulated by the absorption of nitrogenous matter, excrete an acid digestive secretion similar to that of the sundew.

SUN-DIAL: *see* DIAL.

SUNDSVALL, a seaport of Sweden in the district (*län*) of Vesternorrland, on a wide bay of the Baltic, at the north of the Selånger River, 360 m. N. by W. of Stockholm, the terminus of a branch from Ange on the northern railway. Pop. (1928), 17,637. It was rebuilt in brick and stone after a fire in 1888.

SUNFISH, a name sometimes given to the *Centrarchidae,* a family of perch-like fishes inhabiting the fresh waters of North America, and especially to the common sunfish or pumpkin-seed (*Eupomotis gibbosus*), abundant, especially in ponds, from Maine to Minnesota and southward near the Atlantic coast to Florida. This favourite of juvenile anglers has a strikingly coloured, ovate, compressed body—whence the popular name pumpkin-seed—which is sometimes 8 in. long, though usually smaller, greenish and bluish olive above, spotted with orange on the sides, and orange below. The female deposits her eggs in a nest scooped in the muddy bottom of shallow water by the male, who guards it until the young are hatched.



BY COURTESY OF THE NEW YORK ZOOLOGICAL SOCIETY

THE COMMON SUNFISH (EUPOMOTIS GIBBOSUS) OR PUMPKIN-SEED

The name sunfish is applied also to the *Molidae,* marine fishes of the order Plectognathi. These curious fishes appear tailless, the body ending abruptly behind the dorsal and anal fins; they have a small mouth, with a single sharp edged tooth-plate in each jaw. *Mola* include two species, large, stout, deep-bodied fishes with a rough skin; they are oceanic, inhabiting warm seas, and may often be seen resting at the surface; they reach a length of 8 ft. and a weight of perhaps two tons. The oblong sunfish (*Ranzania truncata*) is longer and more compressed, smooth, with tessellated scutes; it reaches 2 feet.

SUNFLOWER. The common sunflower, known botanically as *Helianthus annuus,* a member of the family Compositae, is a native of the Great Plains region of the United States. It is an annual herb with a rough hairy stem 3 to 15 ft. high, broad coarsely toothed rough leaves 3 to 12 in. long, and heads of flowers 3 to 6 in. wide in wild specimens and often 1 ft. or more in cultivated. Double forms are in cultivation, one (*globosus fistulosus*) having very large globular heads. The plant is valuable from an economic as well as from an ornamental point of view. The leaves are used as fodder, the flowers yield a yellow dye and the seeds contain oil and are used for food. It is cultivated in Russia, England and other parts of Europe, in Egypt and in India for the seeds, the yellow sweet oil obtained by compression from which is considered equal to olive or almond oil for table use. Sunflower oilcake is used for stock and poultry feeding, and is exported by Russia to Denmark, Sweden and elsewhere. The genus *Helianthus* contains about 60 species, chiefly natives of North America, a few being found in Peru and Chile. They are tall, hardy annual or perennial herbs, several of which are of easy cultivation in gardens with moderately good soil. *H. decapetalus* is a perennial about 5 ft. high with solitary heads about 2 in. across in slender twiggy branchlets; *H. multiflorus* is a beautiful species with several handsome double varieties; *H. orygalis* is a graceful perennial 6 to 10 ft. high, with drooping willow-like leaves and numerous comparatively small yellow flower-heads. *H. atrorubens* is a smaller plant, 2 to 5 ft. high, the flower heads of which have a dark red or purple disk and yellow rays. There are many fine forms of this, some of which grow 6 to 9 ft. high and have much larger and finer flowers than the type. Other fine species are *H. giganteus,* 10 to 12 ft.; and *H. mollis,* 3 to 5 ft. *H. tuberosus* is the Jerusalem artichoke.

SUNG DYNASTIES: *see* CHINA, *History;* CHINESE PAINTING; CHINESE SCULPTURE.

SUNIUM, a cape at the S. extremity of Attica, with a temple of Poseidon as landmark for ships, the modern Cape Colonna. The rocky promontory was fortified by wall and towers, in 413 B.C., against the Spartans in Decelea; but was soon after seized by fugitive slaves from the Laurium mines. In the 4th century it was still a fortress. The temple, probably built in the time of Pericles, in the place of an earlier one, similar but of tufa or "poros" stone, is shown by an inscription to be dedicated to Poseidon, not, as formerly supposed, to Athena, whose temple, of peculiar plan, with colonnade on two sides only, lies about a

quarter of a mile away to the N E Of Poseidon's temple there are still standing nine columns of the S side, two of the peristyle on the N, one of the *antae* and an inner column of the *pronaos*, of local white marble, which has suffered from the weather.

SUNLIGHT TREATMENT. (*See* also HELIOTHERAPY; VITAMINS.) In countries where, relatively, there is much persistent cloud, in extreme northern or southern lands where night is long in winter, on the sunless slopes of mountains or in sunless valleys, in factory towns where smoke defiles the atmosphere with its soot particles, in slums where the houses are crowded together and men, women and children are herded in dark damp rooms with vitiated air it is found that resistance to infective disease is low, rheumatism and tuberculosis are rife, expectation of life is below normal, infant mortality is high To these conditions, no doubt, many causes contribute but it is generally believed a deficiency of sunlight is a powerful factor The tendency at the present day regarding the attributes of the sun's rays is to lay much stress upon the invisible ultra-violet rays of the solar spectrum as well as upon the invisible infra-red and the visible rays.

Treatment by Direct Sunlight.—This is difficult or impossible under such conditions as have been mentioned above; some methods of supplying it are by the provision of open spaces and playing fields in the neighbourhood of crowded areas, establishment of open-air schools, cult of outdoor sports, etc But even if sunlight be available the atmospheric conditions may permit of little penetration by the ultra-violet rays. Hence, methods have been adopted to supply these from abundant supplies such as the electric arc and the mercury-vapour quartz lamp, and to minimize screening effects by the use in buildings of such material as glass made of quartz which admits a maximum of ultra-violet and other beneficial rays, by the use of lighter and more porous clothing, or even by exposure of much of the body Thus in one way or another, whether as a curative or preventive measure against disease there is a great movement towards supplying, naturally or artificially, that sunlight which is deficient As a preventive measure the use of sunlight is modern, but the curative side has been recognized for centuries, having been used by the Chinese, Egyptians and the South American Indians and is represented by the numerous health spas and resorts throughout the world

Mode of Action of Direct Sunlight.—The rays of sunlight, when analysed by the prism, range between the infra-red (heat) rays of relatively long wave-length and slow frequency to the ultra-violet (chemical) rays of shorter wave-length and greater frequency Within this range the penetrating power of the infra-red and of ultra-violet rays into human tissues is definitely less than that of the visible rays Hence heat from the visible rays of sunlight passes through the skin and, largely, is taken up by the blood and distributed by way of the circulation throughout the body; infra-red heat rays warm the superficial layers of the skin and from them heat is carried to other parts Ultra-violet light produces its effects in the skin itself and its action is manifested by the inflammation peeling and tanning that exposure to the sun occasions in most persons The pigment of coloured races prevents the penetration of ultra-violet rays deeper than the pigment layer and thus is a protection in tropical countries

Warmth.—The increased warmth, when moderate, stimulates metabolism, induces a sense of well-being, increased appetite and mental activity, when greater, as in the height of summer or in the tropics, leads to sweating, desire for cool drinks and cool breezes and disinclination for food, particularly sugars and fats the oxidation of which supplies a large proportion of animal heat; and when excessive it leads to the pathological condition of sunstroke or heat-stroke (*q v*)

Ultra-violet Rays.—But the ultra-violet rays are now known to have special qualities For long it has been known that the skin has the property of regulating heat loss and so contributing towards maintenance of a stable body temperature in warm-blooded animals Recently it has been shown experimentally that even a short exposure to ultra-violet radiation modifies the bactericidal power of the blood and its leucocytic content. Moreover, the discovery that vitamin D (*see* VITAMINS) can be produced in ergosterol—an impurity apt to be present in all cholesterols but found originally in ergot of rye (*q v*)—has indicated a variety of action of which the full importance is, probably, still unknown. In investigations on rickets (*q v*) it was found that cod liver oil is beneficial; later, that ultra-violet irradiation is beneficial, even in the absence of cod liver oil, and ultimately that ultra-violet rays act on the non-saponifiable part of a natural fat, *i e.*, the sterol, and produces vitamin D. From this it appears that the ultra-violet rays of summer sunlight act upon the ergosterol impurity in the cholesterols present in all animal cells and build up a store of vitamin D for our use during the winter when the ultra-violet radiation of sunlight is deficient.

The fact that ergosterol when exposed to ultra-violet radiation produces vitamin D has been turned to practical and commercial account. Under the rays ergosterol changes from a white crystalline solid to a pale yellowish oily fluid which possesses the highest vitamin D potency known Thus artificially produced, there can be supplied to foodstuffs (*e g.*, milk, butter, margarine) in their preparation an element deficient when produced in winter but normally present in sufficient quantity when produced in summer Under natural conditions we eat foods containing ergosterol and this is acted upon in our bodies by the ultra-violet radiation reaching our skin, or (*e g*, in the consumption of New Zealand butter) we incorporate during the relatively sunless period in England vitamin D formed in the New Zealand sunny period.

Experiments and Theories.—The subject is a very complicated one but there is no doubt that the mortality from many diseases normally reaches its highest point in England in the winter months of January, February and March Confidence in the therapeutic value of sunlight is strengthened by the beneficial results accruing in the monkey-house of the Zoological Gardens, London, where electric lamps of fused quartz have been installed to allow of the passage of ultra-violet rays to the animals It must be noted, however, that this artificial sunlight must be used with great caution and for short periods as otherwise it has proved harmful Indeed there is reason to believe that while a moderate exposure to ultra-violet radiation builds up vitamin D an excessive exposure destroys it A natural extension of knowledge recently acquired concerning the effects of sunlight has been into the fields of animal and plant rearing So far investigations have been conducted, mainly, by replacing ordinary glass by special glass admitting a maximum of the beneficial rays and the results are hopeful Here it may be mentioned that the output of ultra-violet radiation from an electric system, though dependent upon the current and voltage between the poles of the arc, varies widely according to the type of electrode used A positive carbon electrode with an iron core, disposed *below* the negative plain carbon electrode, instead of *above*, is a powerful source of ultra-violet radiation

Lastly, mention must be made of Dr. Rollier of Leysin, Switzerland, and of Sir Henry Gauvain of the Treloar hospital for cripples at Alton, Hants., England, pioneers in the modern sunlight treatment of disease and of a remarkable journalistic success in the *Sunlight and Health Supplement* to *The Times* newspaper issued in London on May 22, 1928, to which the writer of this article is much indebted (W. S L-B)

SUNN or **INDIA HEMP** (*Crotalaria juncea*), a plant which is a native of India and Ceylon It frequently receives other names, *e g*, false hemp, Bombay hemp, etc The plant is an annual, requires a light soil, and is easily cultivated Sometimes the seed is sown in October for the winter crop, and sometimes in May or June for the summer crop. When the seeds are sown in May, the bright yellow flowers appear in August, when the plant may be gathered It is not unusual, however, to defer this operation until the seed is ripe, especially if a fibre of great strength is desired. The fibre has an average length of 3 to 4 feet It is extensively used for rope and cordage and also for paper-making in its native country, but it has made little progress elsewhere.

SUNNIS (SUNNITES): *see* ISLAM.

SUNSHINE. As a meteorological element sunshine requires some conventional definition There is uninterrupted continuance of gradation from the burning sunshine of a tropical noon to the pale luminosity that throws no shadow, but just identifies

the shape of the sun through the thin clouds of northern skies.

The Campbell-Stokes Sunshine Recorder.—In the British Isles the sun is allowed to be its own timekeeper and the scorch of a specially prepared card used as the criterion for bright sunshine. The practice arose out of the use of the sunshine recorder which depends upon the scorching effect of a glass sphere in the sun's rays. The original form of the instrument was suggested by J. F. Campbell of Islay in 1857. He used a glass sphere within a hemispherical bowl of wood. The scorching of the wood along successive lines of the bowl as the sun alters its declination from solstice to solstice leaves a rugged monument of the duration and intensity of the sunshine during the half-year, but does not lend itself to numerical measurement. The design of a metal frame to carry movable cards and thus give a decipherable record of each day's sunshine is due to Sir G. G. Stokes. The excursions of the sun to the north and south of the equator are limited by the tropical circles, and the solar record on the hemispherical bowl will be confined within a belt 23° 27′ north and south of the plane through the centre parallel to the equator or perpendicular to the polar axis. Thus a belt 46° 54′ in angular width will be suitable for a sunshine recorder for any part of the world. Whatever place be chosen for the observation the same belt will do if it is set up perpendicular to the earth's polar axis. As examples of the cutting of the belt for different latitudes we may put side by side the recorder as used in temperate latitudes (fig. 1) and the special form designed in the Meteorological Office, London, for use on the National Antarctic Expedition, 1901–1904 (fig. 2). A belt cut for a particular latitude is serviceable for some 10° on either side of that latitude if the cards are not trimmed too closely to the cutting of the belt. The belt must always be adjusted round the parallel to the polar axis. If the cut of the belt is too oblique for the latitude of the place where it is exposed, and the cards are cut strictly to the belt, the northern side of the cut will be below the horizon and the southern side above it, some sunshine may be lost near sunrise or sunset in the winter because there is no card to receive it. The part projecting above the horizon in summer will partly shadow the globe, and faint sunshine may be lost, for at most only half the globe can be solarized at sunset. But the loss due to this cause is unimportant. Stokes designed the complete belt to use successively three cards of different shape for different times of the year. The equinoctial card forms a portion of a cylinder round the polar axis for spring and autumn, the summer card and the winter card each forms a part of a cone making an angle of 16° with the polar axis.

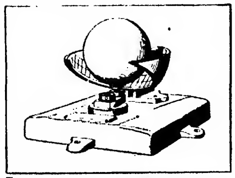


FIG. 1.—CAMPBELL-STOKES SUNSHINE RECORDER

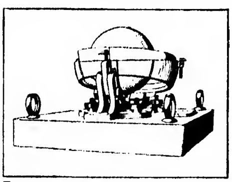

FIG. 2.—ANTARCTIC SUNSHINE RECORDER

Measurement of the Sunshine Record.—It was mentioned that the Campbell-Stokes recorder involves a conventional definition of sunshine. The recorded day of sunshine is less than the actual time during which the sun is above the horizon by about twenty minutes at sunrise and sunset on account of the want of burning power of a very low sun. Some further convention is necessary in order to obtain a tabulation of the records which will serve as the basis of a comparison of results for climatological purposes. The spot which is scorched on the card by the sun is not quite limited to the image of the sun, and a few seconds of really strong sunshine will produce a circular burn which is hardly distinguishable in size from that produced by a minute's record. Consequently with intermittent sunshine exaggeration of the actual duration of burning is very probable.

Other Types of Sunshine Recorder.—There are, however, various other conventions as to sunshine which are used as the basis of recorders of quite different types. The Jordan recorder uses ferro-cyanide paper and the sun keeps the time of its own record by the traverse of a spot of light over the sensitive paper, arranged as a cylinder about a line parallel to the polar axis. The effect thereby recorded is a photochemical one, and the composite character of the sun's radiation, modified by the selective absorption of the atmosphere, makes the relation of the record to that of the sun's scorching power dependent upon atmospheric conditions, so that the two records give different aspects of the solar influence on different occasions. Other recorders prefer to use the thermal or photographic effects of the sun's rays and record duration by a clock instead of allowing the sun to keep its own time. In the Marvin sunshine recorders of the United States weather bureau an electrical contact is made by the thermal effect of the sun and the duration of the contact is recorded. An instrument which gives a corresponding result is described by W. H. Dines (*Quart. Journ. Roy. Met. Soc.* xxvi. 243). These define sunshine by the effect necessary to produce or maintain a certain thermal effect, but the definition once accepted there is no uncertainty as to the record. The Callendar sunshine recorder gives a record of the difference of temperature of two wires, one solarized and the other not, and it is therefore a continuous record of the thermal effect of solar and terrestrial radiation.

Exposure.—We now consider what the daily sunshine record for a particular station means. An ideal exposure has an uninterrupted view of those parts of the horizon in which the sun rises or sets; and elsewhere the view of the sun must not be obstructed by the ground, buildings, trees or any other obstacle; but ideal exposures are not always to be obtained. In mountainous districts particularly it may be impossible to find a site in which the sun is not obstructed for an appreciable part of the day. In these circumstances it becomes a question whether the amount of sunshine recorded should be referred to the maximum possible for an uninterrupted horizon or the maximum possible for the particular exposure. The answer to the question really depends upon the purpose for which the information is wanted. As a climatological factor of the locality the shadow cast by the surrounding hills is of importance, it is part of the difference between the fertility of the southern and northern slopes of hill country. This importance is, of course, in many respects exclusively local, and indeed the possible duration of sunshine at any station is a local characteristic which it is desirable to know. Consequently as evidence of the peculiarity of the site the recorded sunshine might be referred to the total possible with a free horizon. On the other hand, taking the record of sunshine as an indication of the clearness of the sky for the purposes of general meteorology, the screening of the sun by hills must be regarded simply as limiting the time during which observation is possible and the duration of the sunshine recorded should be referred to the possible duration at the particular site.

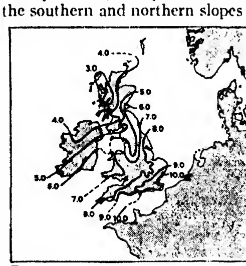

FIG. 3.—DAILY SUNSHINE FOR JULY. FIG. 4.—DAILY SUNSHINE OCTOBER

Sunshine Records for the British Isles.—The interest in the use of sunshine recorders is more widely extended in the British Isles than elsewhere, and it is, so far as the public are concerned, the most important meteorological element, but it is singular that up to the present a knowledge of the total amount of sunshine recorded during the day, the week, the month or the year is all that is apparently required.

In figure 3 the mean daily duration of sunshine for the month of July 1928 is represented by a number of isohels or lines of

equal sunshine, the figures being given in hours Figure 4 gives similar data for October 1928 Further, figure 5 represents the average weekly distribution of sunshine in different sections of the British Isles according to the average of twenty-five years. (X.)

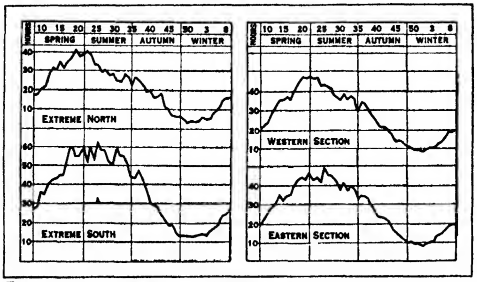

FIG. 5.—AVERAGE WEEKLY SUNSHINE IN DIFFERENT PARTS OF THE BRITISH ISLES

The United States.—Continuous records of sunshine in the United States are kept at nearly two hundred different points well distributed over the country, the records being obtained by means of the Marvin electrical sunshine recorders, the character of which is described on page 569. Sunshine data may be expressed either in the actual hours of sunlight at each individual station, or in percentage of the hours of actual sunshine as compared with that possible Both systems have their advantages, but in the contrasting of different climates it appears that data on the percentages of possible sunshine actually received afford the better comparison of different regions, since the possible hours vary greatly for different seasons and localities, and their values must be made known before comparisons are feasible

Considering first the annual sunshine, it becomes apparent that the United States, as a whole, is a country of abundant sunshine, nearly two-thirds of the entire area receiving annually on the average more than 60% of the possible amount, a proportion exceeded by only a few of the localities commonly referred to as having sunny climates.

Over a large part of the south-west, extending westward from central Texas, and including the western portions of Oklahoma and Kansas, nearly to the Pacific Coast, the annual amounts average more than 70% of the possible, and localities in the far south-west, including extreme western Texas, the southern portions of New Mexico and Arizona, and portions of Nevada and the interior of southern California, have averages in excess of 80%, Yuma, Arizona, having the maximum amount of recorded sunshine in the country, 88% of the possible.

Small areas of the northern portions from the Upper Lakes westward to Washington, much of the lower Ohio Valley and nearby portions of the Great Lakes, and small portions of the North Atlantic States have annual percentages ranging between 50 and 60%, while only limited portions of the far North-west, the districts around Lake Superior, and the area from the upper Ohio Valley north-eastward to northern New England have averages less than 50% of the possible

In general during the colder months the percentages of the possible sunshine are less than during the warm season, but even then a large part of the central and southern areas west of the Mississippi River have amounts in excess of 60% of the possible, while the warmer months mainly have decidedly high percentages,

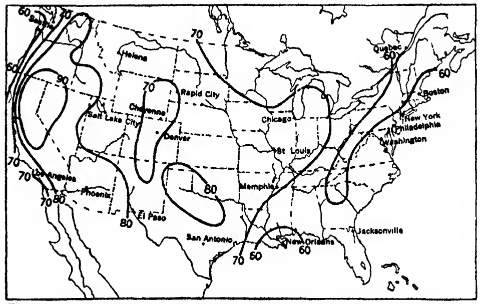

FIG. 6.—PERCENTAGES OF THE POSSIBLE AMOUNTS OF SUNSHINE IN THE UNITED STATES IN JANUARY, BASED ON MANY YEARS OF OBSERVATION

the summer months particularly having values ranging from 60 to 80% in nearly all parts, and even exceeding 90% of the possible in portions of interior California and nearby areas of Nevada.

The accompanying charts (Figs 6 and 7) show the percentages of the possible sunshine in all parts of the country for January and July, and indicate the approximate sunshine conditions for winter and summer respectively. (C F M)

Sunshine Results for Other Parts of the World.—Maps showing the average annual distribution of sunshine over Europe and North America are given in Bartholomew's *Physical Atlas,*

Monthly and annual percentages of sunshine at points in the United States and in the vicinity of the Mediterranean Sea.

vol. iii. *Atlas of Meteorology*. Over Europe the largest totals, over 2,750 hours per annum, are shown over central Spain. In North America, values exceed 3,250 hours per annum in the New Mexico region. For other parts of the world the information available is not sufficiently extensive for the construction of charts.

Effect upon Sunshine Records of the Smoke of Great Cities.—Much discussion has taken place from time to time as to whether the climate of a locality can be altered by artificial

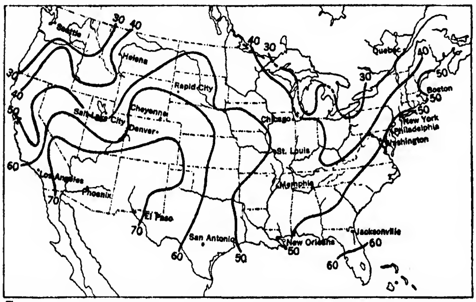

FIG. 7.—PERCENTAGES OF THE POSSIBLE AMOUNTS OF SUNSHINE IN THE UNITED STATES IN JULY, BASED ON MANY YEARS OF OBSERVATION

means. One question of the kind to which the sunshine recorder gives an incontrovertible answer is as to the effect of the smoke of great cities in diminishing the sunshine in the immediate neighbourhood. This is not a question which comes out merely by taking averages. The answer can be seen directly by comparing the daily cards at the different localities. Thus it appears that the direct effect of the local contamination of the London atmosphere results in the diminution of the recorded sunshine for the whole year by 37%, and it is clear that the contamination extends in some degree as far as Kew, where the loss amounts to about 10%. There is evidence of various kinds to show that the effect of the smoke cloud of cities can be traced sometimes for great distances.

Ultraviolet Light.—A beam of sunshine contains radiation having a wide range of wavelengths. The human eye is only sensitive to about one octave of wavelength, from 0.4 microns (0.0004 mm.) to 0.8 microns (0.0008 mm.), corresponding to violet and red light respectively. Roughly one-half of the energy of a beam of sunshine is contained within the limits of visible light, and most of the remainder is accounted for by infra red or heat rays. Rays whose wavelengths are between 0.4 microns and about 0.014 microns are known as ultraviolet rays. Such rays are present in the solar beam, but with relatively small intensity. They are of little or no meteorological importance, so far as our present knowledge extends, but they are of very considerable importance in photography and in their actions on living organisms of all kinds. These rays are readily absorbed or scattered by impurities in the atmosphere, and even by relatively clear air, and one of the most serious effects of the smoke of great cities is the removal of the ultraviolet rays from the solar beam. Ordinary window glass also absorbs completely the ultraviolet rays of wavelength below 0.31 microns. Special types of window glass are however obtainable which transmit fairly freely ultraviolet light down to 0.2 microns. Ordinary sunlight contains no rays of wavelengths below about 0.29 microns.

Dr. Leonard Hill states (*Sunshine and Open Air*, page 47) that of the radiation reaching the outer limits of the earth's atmosphere some 40 per cent of the longer ultraviolet rays and 20 per cent of the shorter ultraviolet rays reach high level mountain resorts, and 23 per cent of the longer, and 7 per cent of the shorter ultraviolet rays reach sea level.

The intensity of solar radiation of different wavelengths can be measured by means of a spectrobolometer, in which a beam of sunlight is first spread out into a spectrum, and the light within a narrow band of wavelengths is allowed to pass on to a platinum strip. The strip of platinum forms one branch of a Wheatstone's bridge. The opposite branch is formed by an exactly similar platinum strip which is shielded from radiation. The energy absorbed by the first platinum strip raises the temperature and consequently increases the resistance of the strip. The increase in resistance is accurately measured by a galvanometer in the bridge circuit and the amount of radiant energy can be deduced.

Ultraviolet rays have marked biological effects, in particular those of pigmentation of the skin and of destroying certain bacteria. References to recent researches will be found in the *Annual Reports* of the British Medical Research Council, published by H.M. Stationery Office, London. Among recent results may be mentioned the discovery that ultraviolet rays between 0·28 and 0·30 microns are capable of activating ergosterol and producing vitamin D. (*See* a series of articles by various authors in a Supplement to *Nature*, April 21, 1928; *see* also RADIOLOGY; RADIO-THERAPY; SUNLIGHT-TREATMENT.)

SUNSTONE, a variety of the mineral felspar (*q.v.*) exhibiting a brilliant spangled appearance in certain directions, due to minute scales of iron oxide arranged parallel to a cleavage. It is somewhat similar to aventurine (*q.v.*). The best known locality in Tvedestrand, Norway. It is also found near Lake Baikal. Siberia, and at several localities in the U.S.A., especially at Middletown, Pa., and Statesville, N.C.

SUNSTROKE AND HEATSTROKE, a term applied to the effects produced upon the central nervous system, and through it upon other organs of the body, by exposure to the sun or to overheated air. Although most frequently observed in tropical regions, the condition occurs also in temperate climates during hot weather. A moist, still atmosphere greatly increases the liability to heatstroke.

Sunstroke has been chiefly observed and investigated among soldiers in India, where formerly, it constituted a considerable item of sickness and mortality. While any one exposed to great solar heat may suffer from sunstroke, anxiety, worry or overwork, irregularities in food, intemperance, the wearing of tight garments, marching in close order and living in overcrowded and insanitary dwellings are predisposing causes. A similar condition affects persons whose occupation exposes them to excessive heat, such as stokers, laundry workers, etc., particularly in hot weather. In the tropics Europeans, especially recent arrivals, are more readily affected than natives. But natives are not exempt.

The symptoms of heatstroke, which depend upon disorganization of the normal heat-regulating mechanism, vary in their intensity and to some extent in their form. A case of average severity usually begins with sickness, giddiness, mental excitement followed by drowsiness, and passes into syncope in which there are pallor and coldness of the skin, a weak, quick and intermittent pulse, and gasping or sighing respiration. The internal temperature is raised even as high as 108° F or more. The pupils are often contracted. Death may quickly occur; but if timely treatment is available recovery is probable.

Attacks of sunstroke are apt to leave traces of their effects especially upon the nervous system. A liability to severe headache, which may depend upon chronic meningitis, epileptic fits, mental irritability and alterations in the disposition are among the more important. Heat is ever afterwards ill borne and there also is an abnormal susceptibility to the action of stimulants.

Treatment.—Means should be adopted to prevent attacks in the case of those who must necessarily be exposed to the sun. These consist in the wearing of loose, light coloured clothing, protection of the head and back of neck, supply of sufficient water or cold tea to make up for fluid lost by sweating, avoidance of alcoholic and other excesses. Sleeping in the open air in very hot seasons is recommended. In an attack the patient should be at once removed into the most shaded, airy and cool place available. Rest in the recumbent position, the use of diffusible stimulants, such as ammonia or ether, etc., together with friction or warmth applied to the extremities may be sufficient, but in severe cases by far the best results are obtained by the use of cold (cold baths, rubbing the surface with ice, enemata of ice-cold water). The effect is a marked lowering of the temperature and stimulation of the respiratory function. Mustard or turpentine applied to the nape of the neck or chest is a useful adjuvant.

SUN YAT-SEN (1867–1925), Chinese republican leader. Dr Sun (known in China by the more familiar title of Sun Wen) nay truly be described as the Father of the Chinese republic. His ather, a poor farmer living at Hsiang Shan near the island of Macao, was a convert to Christianity (under the London Missionary society) and his son continued to describe himself as a Christian till his death, before which he gave instructions that he hould be buried with Christian rites.

In 1891 Sun entered upon a medical course at the newly formed nedical school in Hongkong of which he was the first graduate n 1894. It was here that his life-long friendship with Sir James Cantlie began Through a Chinese fellow student, Sun came into ssociation with a secret revolutionary society He was concerned n a revolutionary plot in 1895, but escaped, though the other onspirators were executed Then began a long period in Sun's ife, when, like Mazzini, he was working outside his native country vith the object of bringing about a revolution In 1898 he adopted he three fundamental principles of Nationalism, Democracy and ocialism; the five spheres in which they were to be worked out vere. the executive government, the legislative field, the judicial eld, the civil examinations and the department of censorship or npartial scrutiny of public matters and officials

It was not, however, until 1905 that Sun publicly declared his dherence to these ideas and worked them out in fuller detail He ttempted to use the reaction after the Boxer outbreak of 1900 as means of establishing a democratic government and ending the Manchu régime, but this attempt as others proved abortive In 905 the Chinese Revolutionary League was formed in Europe nd Japan, and through this Dr. Sun enlisted the support of a reat number of Chinese not resident in China During this eriod he raised large sums of money, and was thus able to pread his ideas through secret agencies in China itself A large rice, finally amounting to £100,000, was placed upon his head On one occasion in 1896 he was kidnapped while in London and eld at the Chinese legation for several days. His release came bout through a note to Sir James Cantlie, which was smuggled ut of the legation Lord Salisbury then took the matter up.

Sun's personal influence had much to do with the inner organization of the revolution of 1911 against the Manchu government see CHINA, *History*) While there was a widespread feeling that he dynasty had outlived its usefulness, there was little understanding of what was involved in establishing a republic and only he efficient organization of the Kuo-min-tang (Sun's creation, nown as the Republican party) was able to turn the anti-Manchu de into a pro-republican movement Sun was in England when he revolution began He returned to China, and on Jan. 5, 1912, e took the oath of office as provisional president of the new epublic, at the request of the national convention in Nanking.

On Feb 12 an imperial edict announced the abdication of the mperor and the substitution of republican for monarchical Government Yuan Shih-K'ai was entrusted with the task of carrying hrough the changes involved, and Sun, realizing the impossibility f uniting the country under his own presidency, resigned his residency in favour of Yuan He accepted the post of Director-General of Transport and Trade, but was always more of the ropagandist and inspirer than the practical administrator.

He became increasingly restless under the leadership of Yuan hih-K'ai, and in 1917, after the latter's coup d'état and death, e put himself at the head of a movement for an independent epublic of South China The strength of his support had always een drawn from Kwang-tung province, and he soon found it npossible to co-operate with the military leaders in Canton He herefore resigned from his position as president of the republic f South China. The military régime was maintained largely by Kwang Si troops until 1921 when Ch'en Ch'iung-ming drove them ut and called in Sun again.

The following year he determined on an advance in force gainst the north, while Ch'en Ch'iung-ming desired to consolidate he work begun in the province of Kwang-tung This led to an pen breach and Sun was once more driven from his native province, finding refuge in Shanghai In Feb 1923 he called to his id troops from Kwangsi and Yunnan and thus defeated his one time colleague and subsequent rival, General Ch'en. From that time until his death he was acknowledged as the chief executive of the province, but his effective sway did not extend far beyond Canton. He used and permitted violent methods, more particularly in the attack upon the Merchants Volunteer corps and the looting and burning of a considerable part of the city of Canton in March 1924. In this way he lost much of the support which had been given to him and to the Kuo-min-tang by Chinese overseas. But his socialist views ensured him the support of the mass of the workers, and he repeatedly secured rises in wages for the Canton workers

So far as local support was concerned Sun's star seemed to be declining in the autumn of 1924, but he was still idolized by the student class and in his own party where his was a name to conjure with It was then that Feng Yu-hsiang brought about his coup whereby Wu Pei-fu (a determined enemy of Sun's) was routed and Chang Tso-ling co-operated with Feng to put the old Anfu leader Tuan Ch'i-jui in the position of Chief Executive in Peking Sun had been cultivating friendly relations with the parties now predominant, and he was called to Peking to confer with them in regard to the calling of a people's conference and other matters connected with the establishment of the new régime. He died of cancer on March 12, 1925, at Peking An impressive memorial, built at Nanking, received his remains in 1929

His public works include a number of speeches, articles and pamphlets, more particularly the following *The Doctrine of Sun Wen; The International Development of China; The Principles of Democratic Government* (statement of 25 outstanding points) *See* Sir James Cantlie and C S Jones, *Sun Yat Sen and the Awakening of China* (1912), P. Linebarger, *Sun Yat Sen and the Chinese Republic* (1925); *Sun Yat Sen, Memoirs of a Chinese Revolutionary* (1927).

SUPERANNUATION. The custom of providing pensions for aged employees who, after meritorious service, are no longer able to discharge their duties efficiently, has become increasingly common since the middle of the 19th century The problem of mitigating the hardships of old age has been attacked from many angles and a great variety of solutions has been tried In England superannuation schemes for discharged seamen and soldiers date back to the middle ages; these were followed by systems applicable to civil servants and other public officials, and to employees of statutory undertakings Finally the custom of making some kind of provision for old age has gradually spread to the employers of labour on a large scale and even to businesses with relatively small staffs Simultaneously the question has received attention on national lines; this aspect of the subject is treated under OLD AGE PENSIONS, the present article being limited to the examination of superannuation schemes in which the title to benefits has its roots in service given to a particular employer during the pensioner's working life.

At the outset the granting of a pension is often merely an eleemosynary act dictated by the employer's wish to reward meritorious service, or to safeguard an old servant from penury in his declining years Later, the occasional grant in these circumstances having become a custom, superannuation allowances come to be looked upon as a right by the officials, and as a means of securing efficiency by the employer, who realizes that the retention of aged officials no longer fitted to perform their duties adequately—especially if they hold responsible posts on the directing staff—seriously jeopardizes the conduct of his business In such a case a definite scheme prescribing the ages between which retirement shall normally occur (generally between 60 and 65), laying down scales and conditions of benefit and defining the class of officials to be included is soon recognized, both by the employer and by the employees, to be essential. With regard to finance the need for sound principles was unfortunately in the past not realized so soon The expenditure on pensions, being almost negligible in the early years, was often charged to current revenue, and until this burden became heavy as the numbers on the pension roll grew, causing expenditure to increase at an alarming rate, the need for making provision for accruing liabilities was not appreciated. Generally speaking, prudential considerations dictate that appropriate sums should be set aside and accumulated at compound interest throughout a person's service, while the lia-

bility for superannuation is accruing, in order that when he retires the sum in hand shall be sufficient to provide for his superannuation allowances. By this method full provision being made before the pension commences, the burden of superannuation is met *pari passu* with payments of salary during service.

The accumulation of the appropriate reserves can be effected either in a privately managed superannuation fund or by an assurance company on behalf of the managers of the scheme. Under the former arrangement it is usual to institute a trust fund definitely alienated from the ordinary business transactions of the employer. In Great Britain such funds enjoy certain privileges in regard to income tax upon their interest income. Similarly concessions are allowed in respect of contributions whether paid by the employer or employee to a superannuation scheme.

Provident Funds.—The simplest form of superannuation scheme is a fund supported by periodical contributions (of fixed amount or varying with salary) generally paid in equal shares by the employer and the staff. On retirement the employee is entitled to withdraw the contributions paid by himself and on his behalf by his employer, with their accumulations of interest. A development of this plan is an arrangement for the accumulated sum at retirement to be applied as purchase money for an annuity payable for the remainder of life; the amount of pension available in a particular case is not ascertainable in advance, but depends on the rate of interest earned while the contributions are accumulating in the fund and the annuity rates current at the date of retirement.

Superannuation Pensions Schemes.—The superannuation schemes which definitely provide for pensions are, however, generally considered to be more appropriate to the requirements of both the employer and the staff than the simple system described above. The pension may be of fixed amount, or may vary with length of service; in the latter case the amount of pension may be uniform for each year of service, or be related to the salary earned by the official during the whole or last few years of service. Systems under which the pension depends both on the duration of service and also on salary have become increasingly popular owing to their elasticity in application to the differing circumstances of a salaried staff consisting of many grades. There are, however, many schemes in which fixed pensions or pensions which grow by uniform increments for each year of service have been adopted as peculiarly appropriate to the needs of the case, *e.g.*, where a scheme is limited to workmen.

In systems based on salary it is common practice to express the pension as a specified proportion (*e.g.*, $\frac{1}{60}$) of pensionable salary for each year of service, subject to a maximum (*e.g.*, forty-sixtieths). There are numerous methods of defining pensionable salary, the most popular being probably the terminal salary, *i.e.*, that earned in the last year before retirement or, in order to avoid fortuitous inequalities of treatment, the average of the last few years of service. Another plan often adopted is to take the average salary throughout service. Where the employee contributes a fixed percentage of his salary throughout his service, and the employer makes annual payments equal to the aggregate contributions made by his staff, it has been argued that from the standpoint of equity the resulting pension should be related to the contributions which have been paid by, or on behalf of, the beneficiary and that accordingly the average salary method should be adopted. But a practical objection to this is that the pension based on average salary is likely to be insufficient to enable a senior officer to maintain a reasonable standard of comfort after retirement unless the scale is fixed so high as to be over-generous to the lower-paid ranks. In this connection it has to be remembered that while all new entrants, with trifling exceptions, start in junior grades entitled to low salaries, their progress varies widely. Judged on the principle that an official, retiring after long service, ought to be able to maintain approximately the style of living to which he has been accustomed, anomalies appear inevitable under the average salary system, and for this reason the terminal salary system has become increasingly popular. With regard to the contention that the average salary system is fairer to the lower paid grades, it may be said that as one of the main objects of an employer is to secure efficiency his contributions may fairly be allocated in the best way to achieve this purpose; and it is generally agreed that since even under the terminal salary method the employee, whatever his rank, receives at least full value for his own contributions and some part of the employer's subvention, the unequal distribution of the latter is not a valid criticism of the fairness of the scheme viewed as a whole.

The average salary system approximates more nearly to giving each employee the equivalent of his own contributions increased proportionately out of the employer's grant, but if exact equivalence is desired the scheme has to be framed on other lines. In such a case each contribution secures a definite amount of deferred pension, varying with the amount of the contribution, the age of the employee and the age at which the pension is to commence. On retirement instalments of pension purchased throughout service are aggregated. The system, generally known as the "money purchase" plan, is easy to work and is often adopted, especially in America and where it is found convenient to re-insure the liabilities for pension with an assurance company in lieu of instituting a private superannuation fund.

Subsidiary Benefits.—Apart from normal superannuation the claims of persons who become incapable of work owing to ill-health before reaching the normal pension age have also to be considered. The hardship of loss of income is obvious, and generally the rules provide for some compensation to be given. In contributory schemes the return (with interest) of the official's own contributions is commonly allowed, but many schemes go further and permit pensions (proportionate to duration of service) to be granted if permanent breakdown occurs after a prescribed minimum period of service. Difficulties may arise in administering a subsidiary benefit of this kind since the test of permanent incapacity is not easy to fix; if it is too rigid, cases of hardship arise, but the financial implications on the stability of the scheme caused by a lax interpretation are very serious. For this reason it is generally considered undesirable to provide for breakdown pensions unless the authority in whom administration is to be vested is prepared to assume responsibility for financial soundness. If an official dies in harness or resigns, voluntary return of at least his own contributions is customarily made; sometimes a minimum payment on death of a year's salary is guaranteed. Subsidiary benefits of the types described above are relatively costly, the effect of giving such concessions being to diminish the resources available for the main benefit, viz., ordinary pensions; to secure a fair balance between these opposing claims is often not easy when a scheme is being framed.

Financial Principles.—As indicated above, the need for sound financial arrangements was often overlooked when the earliest schemes were started; in the following section the underlying principles of contributory schemes are briefly examined. In order that a fund may be in a position to meet its obligations it is essential that the capital in hand, together with the real value of contributions payable in the future, is not less than the present value of future benefits. If this equivalence is maintained, the accumulated fund will continue to increase over many years until the expenditure on benefits becomes stabilized. Where, for example, the number of new entrants each year is constant over a long period the position will eventually be reached when the current expenditure will exactly balance the combined income from contributions and interest. When this occurs the active and retired staff will have reached a stationary condition and very substantial reserves are necessary since in many cases the current expenditure on benefits grows to more than twice as much as the contribution income, and the interest on a fund, which may amount to more than double the current salary bill of the firm, is required to secure equilibrium. The fund should be sufficient without relying on the contributions of future entrants, and its solvency should not be jeopardized if it is decided to close the fund to new entrants. In the past the reasons why large funds should be built up were not always appreciated, and it sometimes happened where a sound fund had been accumulated that an uninformed decision was taken to increase benefits without regard to the enhanced liabilities, often with disastrous results. This experience was not

confined to one country in particular. Many instances in which a scheme having been started on unsound lines had to be reconstructed later can be found both in the British Empire and in America. In this connection reference can usefully be made to the *Report* of the New York City Pensions commission (1916) and to the history of superannuation schemes in the British railways Thus, during the latter part of the 19th century the practice of providing superannuation benefits for railway officials, especially for salaried staff, spread over most of the British railways Certain important weaknesses were disclosed in 1910 by a departmental committee (*Report on Superannuation and Similar Funds of Railway Companies:* Parliamentary Paper Cd 5349); in many cases the benefits had been increased without full understanding of the financial implications and in certain instances little provision was made for accruing liabilities, so that the emerging charge under the company's guarantee would ultimately have become a very grave addition to the normal running expenses The number of funds has since been materially reduced when the railways were amalgamated in a few large groups after the World War, and the opportunity was taken, where necessary, to readjust the financial arrangements

Before a scheme is launched the actuary has to estimate the contribution required to provide the benefits, basing his calculations on the various elements affecting the problem; the principal of these are the rate of interest which will be earned on well-secured investments, the rates of mortality likely to be experienced by the active staff and pensioners respectively, the proportion of staff who will resign voluntarily or who will be retired on health grounds before reaching the normal pension age, and the rate of progression of salaries (on the average) from age to age during service Such an estimate must necessarily be tentative since experience as to all or many of these elements may change in the future; it is necessary, therefore, that the financial structure of the scheme should be reviewed periodically by an actuary and, if the valuation discloses a deficiency or a disposable surplus, appropriate action should be taken to restore equilibrium.

Back-Service.—At the initiation of a scheme the determination of the terms on which existing officers should be included presents some difficulty To put such persons into the position which they would have occupied had they become contributors to the scheme when they joined the staff is very costly, but some credit for back-service is generally deemed essential, otherwise the pension available in many cases would be too meagre for subsistence In practice the problem has been dealt with in various ways; for example it is not unusual to provide for all back-service to count at one-half of the standard rate, the whole of the cost of the concession being borne by the employer Even so the liability cast upon the fund at the outset is substantial and ordinarily its redemption is carried out over a period of years

Life Office Schemes.—Assurance companies offer many facilities to employers desirous of setting up superannuation schemes, and often an arrangement for the liabilities to be reinsured with a company is preferred in lieu of instituting a private superannuation fund There is a wide choice of contract, and though generally speaking it is not possible to secure quite so much elasticity (*e g*, in regard to disability) as under a self-contained scheme the method is popular because it is simple to work and because it protects the employer from the effects of fluctuations of experience Again it is peculiarly adapted to occupations where migration from one employer to another is customary, and for this reason is common in America where, generally speaking, immobility is thought to be a clog on efficiency Provident schemes and money purchase schemes can successfully be arranged with a life office, each contribution (whether fixed or a percentage of current salary) securing a definite endowment or pension, as the case may be, in accordance with a scale prescribed in the policy Common forms of policy provide in return for periodical contributions, deferred annuities of a fixed sum payable on attainment of a specified age (with or without returns of premiums in the event of earlier death), or endowment assurances securing a lump sum (with or without bonuses) at a specified age or earlier death

In those cases where the contribution is based on salary the amount of the annuity or the sum assured is fixed in relation to the salary current when the policy is taken out, supplementary contracts being effected when increases of salary occur. A variation of the deferred annuity system provides an annuity of fixed amount for each year's service; the increment of pension being secured by the contribution (increasing year by year) paid in the related year of service Examples of the life offices schemes are provided by the Federated Superannuation system for universities, under which a percentage of salary is paid by the professor, together with a contribution from the college, as a premium to provide for such superannuation benefits as may be chosen through any one of a number of assurance companies constituting a panel, and by the Federated Superannuation scheme for nurses and hospital officers; in both of these cases the plan was definitely adopted after a comprehensive review of other alternatives. In America the superannuation of certain classes of teachers is arranged on similar lines, contracts being effected on especially favourable terms owing to subventions from the Carnegie foundation for the advancement of teaching, instituted in 1905 Another plan, which had its origin in America, is to make provision for pensions by a group assurance covering several provident benefits for the staff of a particular undertaking These group policies at the outset afforded protection against death only, and were gradually extended to disability and superannuation

Appended to this article is a short list of publications from which more detailed information can be obtained Of these the reports deal with the subject primarily from the point of view of public or quasi-public services, whereas the books are more helpful to an employer contemplating setting up a superannuation scheme for his staff

SUPEREROGATION, the performance of more than is asked for, the action of doing more than duty requires (late Lat *supererogatio,* payment beyond what is due or asked). In the theology of the Roman Church, "works of supererogation" are those which are performed beyond what is required by God, thus forming a reserve store of works of merit which can be drawn upon for the dispensation of those whose works fall short of the standard See *Catholic Encyclopaedia,* article "Supererogation"

SUPER-HETERODYNE RECEPTION, a means of radio reception in which the received current is combined with the current from a local oscillator (*q v*) and changed into a current of intermediate frequency This is then amplified and detected to reproduce the original signal wave

SUPERINTENDENT, a term which, apart from its general use for an official in charge, has a distinct religious connotation, being applied, *e g*, to the head of a Sunday school and to the chief minister in a Methodist circuit In its most important historical sense it refers to certain ecclesiastical officers of reformed churches of the Lutheran model.

In the confusion of the Reformation the name of superintendent was given to a class of men who discharged many of the functions of the older bishops, while bearing a character which in several respects was new. Only in Denmark was the name of bishops reserved for the new officers after the Lutheran model had been adopted and the older bishops had been deposed and imprisoned

It is still used there, though no claim is made that it is the sign of formal apostolical succession. In Scotland the *First Book of Discipline* provided not only for ministers, teachers, elders and deacons, but also for superintendents and readers. The superintendents (who were appointed because of the scarcity of Protestant pastors) took charge of districts corresponding in some degree with the episcopal dioceses, and made annual reports to the general assembly of the ecclesiastical and religious state of their provinces, in the churches of which they also preached.

Duties of Superintendents.—The distinctive character borne by the new officers was determined by the cardinal principles which Luther had laid down in his work regarding the religious functions of the state. He conceived of the secular government as an ordinance of God, and as being set to direct and control the external fortunes of the Church. He hoped that righteous magistrates would at all times form a sound court of appeal in times of ecclesiastical disorder, and that they would guard the interests of truth and justice more securely than had been done under papal jurisdiction. The superintendents, who now had to undertake large administrative responsibilities in the Church, were therefore to be appointed by the civil power and to be answerable to it. They were to stand as intermediaries between the prince or magistrates on the one hand, and the ministers in their districts on the other.

The character of the office and duties of the superintendent were not everywhere the same. Luther shrank from imposing any stereotyped forms and asked that the special circumstances of each separate district should be consulted. He hoped that as few changes as possible would be made, and trusted that the reformed doctrines would spread peacefully throughout the country. After the Diet of Speyer (1526) the civil authorities were invited to reorganize the Church in their respective dominions as they thought best. In the free towns superintendents were answerable to the city fathers for their good order. There were difficulties in the territories of the German princes, and in the case of Saxony Luther proposed to the elector that his first step should be to send out a commission of visitation which should report on the moral and spiritual condition of his principality, district by district. His proposal was carried out, and Luther himself became one of the visitors (1527–1528). He found the people in a state of such religious indifference and ignorance, and the clergy living often in such grossness, that his faith in their fitness to govern themselves ecclesiastically sank even lower than before, and he resisted all schemes for self-government such as had been proposed by Francis Lambert. The church organization which he devised for Saxony provided no place for democratic or representative elements: the grasp of the state must at all times be felt. The superintendent must speak at all times as a minister of the state, and the state must be represented in the synod to which he makes his first report, for upon the synod there must sit not only the pastors but also a delegate from every parish. If any appeal should be made from the decisions of the synod it must be heard in the court of the electoral prince, for he, as supreme civil ruler, possessed the *jus episcopale*, the right of oversight of the churches. Luther proposed that he should exercise this right by appointing a consistorial court composed in part of theologians and in part of canon lawyers, and it was thus that in 1542 the Wittenberg ecclesiastical consistory was formed. Other principalities adopted the model, so that the institution became common throughout the Lutheran churches.

In this scheme the superintendent (or superattendant) was charged with such part of the duty of the older bishops as had been purely administrative. He must concern himself with the discharge of their duties by the pastors of the churches, as well as with their character and demeanour. He must supervise their conduct of public worship, as well as give them licence to preach. He must take cognizance of their ministry to the indigent in their parishes, and of their management of the schools. He must further direct the studies of candidates for the pastoral office. He was answerable to the civil authorities to report all evil-living and false teaching.

The earliest occasion of the appointment of such a superintendent would seem to be found in the decisions of Prince John of Saxony about 1527. He assigns the duties of the office, and summons the newly appointed officer to give diligent heed to the conduct and teaching of the pastors under him, faithfully to warn them of all errors, and, in case they prove obstinate, to report them to the electoral court. He must further give close attention to the due observance of the marriage laws, for in this matter the previously appointed visitors to the principality had reported grave laxity.

Some of the smaller principalities appointed but a single superintendent for their territory, who, instead of being answerable to a consistory, sat as spiritual member on the territorial council, whilst in towns the superintendent was summoned to the town council whenever Church matters arose for discussion. In larger states there were various classes of superintendents with their respective duties severally assigned.

In modern times the functions of the superintendent have been somewhat confused in consequence of the introduction into Lutheran Church theory of inconsistent elements of Presbyterian and synodal type.

See T. M. Lindsay, *History of the Reformation* (1906), i. 400–416; and the articles "Kirchenordnung" and "Superintendent" in Herzog-Hauck's *Realencyklopädie für protestantische Theologie und Kirche.*

SUPERIOR, a city in the north-western corner of Wisconsin, U.S.A., at the western end of Lake Superior, opposite Duluth (Minnesota), with which it is connected by bridges; a port of entry and the county seat of Douglas county. It is on Federal highways 2 and 53, and is served by the Chicago, Milwaukee, St. Paul and Pacific, the Chicago, St. Paul, Minneapolis and Omaha, the Duluth, South Shore and Atlantic, the Great Northern, the Northern Pacific and the Soo Line railways, and many lake steamers. Pop. (1920) 39,671 (27% foreign-born white, largely from Sweden, Norway and Canada). The city occupies a spacious site (36·1 sq.m.) on gently rising ground facing three bays (Superior, Allouez and St. Louis). It has 29 m. of water front, and shares with Duluth (*q.v.*) one of the finest natural inland harbours of the world, ranking second only to New York among the ports of the United States in the amount of commercial tonnage handled (52,712,269 tons in 1927). There is ample water-power, and the manufacturing industries are important, with an output in 1925 valued at $21,536,898. Superior has a cheap fuel supply and power is furnished by electricity generated on the St. Louis river. Superior is an important grain market. Flour is the principal product, and shipbuilding is important. Among steel ships, the type, now almost entirely extinct, known as the "whale-back" originated here; and iron and wooden ships, launches and small pleasure craft are also made. Other manufactures are railway cars, casks, cooperage, saw and planing mill products, furniture, wooden ware, windmills, gas-engines, and mattresses and wire beds. Much iron and copper ore is shipped from the Duluth-Superior harbour; and large quantities of coal, brought by lake boats, are distributed from here throughout the American and Canadian North-west. Superior is the seat of a State Teachers college (established 1893).

Pierre Esprit Radisson and Medard Chouart des Groseilliers probably visited the site of Superior in 1661, and it is practically certain that other French *coureurs-des-bois* were here at different times before Daniel Greysolon, Sieur Du Lhut (Duluth), established a trading post in the neighbourhood about 1678. About 1820 the Hudson's Bay Company established a post here, but there was no permanent settlement until after the middle of the 19th century. Attention was directed to the site by a survey made by George R. Stuntz, a government surveyor, in 1852, and in 1853 a syndicate of capitalists, at the head of which was William Wilson Corcoran, the wealthy Washington banker, associated with whom were Senators Stephen A. Douglas (for whom the county was named), R. M. T. Hunter and J. B. Bright, Ex-Senator Robert J. Walker, Congressmen John C. Breckinridge and John L. Dawson, and others, largely Southern politicians and members of Congress, bought lands here and platted a town which was named Superior. The proprietors secured in 1856 the construction of a military road to St. Paul, Minnesota, 160 m. long. The town grew rapidly, and in 1856–1857 had about 2,500 inhabitants. The

panic of 1857 interrupted its growth, and the population dwindled so that in 1860 there were only a few hundred settlers on the town-site The Civil War increased the depression, and the lands of those who had taken part against the Union were confiscated. In 1862 a series of stockades was built as a protection from the Indians Within the area under the government of the town of Superior, which was at first co-extensive with the county, West Superior was platted in 1883 and South Superior soon afterwards. A village government was established in September 1887, including the three settlements mentioned, and in April 1889 Superior was chartered as a city The harbour was surveyed in 1823–1825 by Lieut. Henry Wolsey Bayfield (1795–1885) of the British Navy. In 1860–1861 it was resurveyed by Captain George G. Meade, who was engaged in the work at the outbreak of the Civil War A branch of the Northern Pacific railway was built to Superior in 1881.

SUPERIOR, LAKE, the most north-westerly of the Great Lakes of North America, and one of the largest bodies of fresh water in the world, is bounded on the east and north by the Province of Ontario, on the west by the State of Minnesota, and on the south by Wisconsin and Michigan

Physiography.—It has deep, extremely cold, clear water, and high and rocky shores along a large portion of its coast. Its general form is that of a wide crescent convex towards the north, but its shores are more irregular in outline than those of the other lakes. Following the curves of its axis from west to east the lake is about 383 m long, and its greatest breadth is 160 miles Its maximum recorded depth is 1,180 ft, and its mean height above sea-level 602 ft, about 21 ft above that of Lakes Michigan and Huron, to which it is joined at its eastern extremity through the river St Mary The lake receives the waters of 200 rivers, and drains a territory of 49,080 sq m, the total area of its basin, including the water surface of the lake, being 80,900 sq miles The largest river which empties into it is the St Louis, at its western end The principal rivers on the north shore are the Pigeon, which forms the international boundary line, the Kaministikwia, the Nipigon, which drains the lake of the same name and together with the lake is about 200 m long, the Pic, the White and the Michipicoten No large rivers empty into Lake Superior from the south There are not many islands in the lake, the largest being Isle Royal, 44 m long, Michipicoten island in the eastern part; St Ignace, in the northern part, off the mouth of the Nipigon river; Grand island between Pictured Rocks and Marquette; Manitou island east of Keweenaw Point, and the Apostle Group, to the north of Chequamegon bay

The boundary between the United States and Canada follows a median line approximately to about mid-lake; thence it sweeps north-westward, so as to include Isle Royal within the territory of the United States, and continues near the north shore, to the mouth of Pigeon river, which it follows westward, leaving the whole west end of the lake in U.S. territory.

Resources of Region.—The Lake Superior region is rich in minerals that have been extensively worked The lake is, as it were, surrounded by iron, which is the probable cause of very strong magnetic fields of influence. Native silver as well as silver ores exist around Thunder bay, native copper was formerly worked on Isle Royal, and rich copper mines are worked on the south shore, while nickel abounds in regions of the country north of the lake

Coasts and Currents.—It has a picturesque coastline, the north shore particularly being indented by deep bays surrounded by high cliffs; the islands also rise abruptly to considerable heights, the north shore furnishing the boldest scenery of the Great Lakes. On the south coast, opposite the broadest part of the lake, are precipitous walls of red sandstone, extending about 14 m, famous as the Pictured Rocks, so called from the effect of wave action on them. There are no appreciable tides and little current. A general set of the water towards the outlet exists, especially on the southern shore From the Apostle islands to the eastward of Keweenaw point this current has great width, and towards the eastern end of the lake spreads out in the shape of a fan, a branch passing to the northward and westward reaching the north coast. Autumn storms raise dangerous seas. The level varies with the season, and also from year to year, the maximum variation, covering a cycle of years, being about 4 feet. The discharge of the lake is computed to be 75,200 cu.ft. per second at mean stage of water, and is controlled by dikes and sluice gates at the head of St Mary's falls.

Navigation.—The season of navigation, controlled by the opening and closing of the Sault Ste Marie canals, averages about eight months—from the middle of April to the middle of December. The lake never freezes over, though the temperature of the water does not, even in summer, rise far above freezing point. The bays freeze over and there is border ice, often gathered by wind into large fields in the bays and extremities of the lake.

Harbours.—Lake Superior is fairly well provided with natural harbours, and works of improvement have created additional harbours of refuge at various points. Marquette, Mich, Presque Isle Point, Mich, Agate Bay, Minn, Grand Marais, Minn, and Ashland, Wis, are on bays which have protective breakwaters across their mouths. Duluth, Superior, Port Wing, Wis, Ontonagon Mich. and Grand Marais, Mich, are harbours with entrances formed by parallel jetties extending across obstructing bars On the Canadian side Fort William, in the mouth of the Kaministikwia, and Port Arthur, 4 m distant, an artificial harbour, are the only important shipping points, being the lake terminals of two great trans-continental railway systems, though the whole north shore is liberally supplied with natural harbours.

Commerce.—The traffic on Lake Superior grows constantly in volume The data collected at United States and Canadian locks at the Sault was as follows in 1927 passengers 55,115, coal 17,-107,500 tons; flour 938,344 tons, wheat 9,926,945 tons; other grain 2,948,295 tons, iron ore 50 098,068 tons, miscellaneous 2,334,912 tons. The total traffic was 83,354 064 tons, valued at over $1,000,000,000 The increase in the past 20 years has been about 100% in both tonnage and value The principal freight shipped eastward consists of flour, wheat and other grains, through Duluth-Superior from the United States, and through Fort William-Port Arthur from the Canadian prairies, copper ore from the mines on the south shore; iron ore in immense quantities from both shores, the principal ore-shipping ports being Ashland, Two Harbors, Marquette and Superior, and lumber produced on the tributary rivers West-bound freight consists largely of coal for general distribution and for terminal railway points.

SUPERMAN, means generally an ideal man The term plays an important rôle in the philosophy of Nietzsche (*q v*) who is mainly responsible for the vogue which the term has

SUPERNATURALISM, a term that may be used for the attitude of mind in which experience of the unfamiliar or uncanny appears to invest it with a distinct character, as if it belonged to a world of its own. On the psychological side it involves the somewhat complex mood known as awe, in which, as W. McDougall shows, various primary feelings such as fear, wonder and submissiveness commingle in no very fixed proportions On the institutional side it provides raw material alike for magic and for religion As Hartland puts it, commenting on Marett's use of the term, supernaturalism furnishes the original "theoplasm, god-stuff." Primitive notions of the type of *mana* (q v.) refer to this special class of experience in which the subject feels powerfully moved and the object seems powerfully moving, so that both inwardly and outwardly wonders happen, whether for better or for worse. It is certain, on the other hand, that the savage does not spend all his time in wonderland, but distinguishes another world, another level of experience, which as the Polynesians phrase it, is *noa*, "commonplace"—the routine of every day. Our word "natural" has to-day very similar associations, though as a matter of fact, if Hubert and Mauss are right, the Greek *physis*, literally "growth," from which our conception of nature is derived, originally meant much the same as *mana*,

namely, the occult force that makes things grow and develop. If it is felt that the word "nature" ought to be reserved for the whole order of the universe, as being really rational and intelligible whatever appearances there may be to the contrary, the more pedantic term "super-normalism" may be substituted; though it cannot be denied that psychologically and historically men have been inclined to view the regular course of things, and certain strange and moving interruptions of it, as sharply contrasted aspects of mind and being.

(R. R. M.)

SUPERNORMAL CHILDREN, EDUCATION OF, the specialized education of children of high intelligence to give them the fullest opportunity to develop to the limit their mental capacity, has attracted widespread attention in the United States, especially since the World War. The results of scientific studies of human heredity and the wide range of mental differences disclosed by the application of intelligence tests to millions of children and adults have exploded the absurd doctrine of human equality. There is a growing recognition of the importance of making the most of our resources of genius, and an increasing interest in the identification and training of gifted children.

That the reform movement in this direction is already under way is indicated by the fact that the 1920 and 1924 *Yearbooks of the National Society for the Study of Education* were both devoted to the education of gifted children. An enquiry which was sent out in 1925 to 413 cities of more than 20,000 population brought the information that 173 of 220 cities replying were making special provision of one kind or another for children of superior ability. In 33 of the 173 cities the special provisions involved little more than an effort to identify the gifted in order that they might be allowed to skip an occasional grade. In the remaining 140 cities, however, a great variety of experiments was under way. The practice of employing "coaching" teachers to prepare bright pupils for grade skipping is fairly common. The little city of Winnetka, Ill., has abandoned class instruction in favour of a system of individual teaching which is intended to allow each pupil to make as rapid progress as his ability permits. The Winnetka plan has aroused keen interest throughout the country, but has not been extensively adopted. An argument against it as a method of meeting the needs of the gifted is that it does not provide differentiated curricula for children of different grades of ability. Some 50 or more cities have attacked the problem in a more fundamental way by adopting the "multiple track" plan of classification of pupils by ability into X, Y and Z groups. By this plan there are three tracks, instead of one, from the first grade up to (and sometimes through) the high school, with a different curriculum for each. The "X" pupils usually include the ablest 5% or 10%. It is not a primary purpose of this plan to enable the bright pupils to complete the elementary or high school course at an earlier age. More important is the fact that the curriculum for the X group is greatly enriched and the methods of instruction considerably modified. Oakland, Cal., began the reorganization of its schools on this plan in 1918, Detroit in 1922, and New York city in 1928. There are in many cities "opportunity" classes for the more exceptionally gifted. These classes are sometimes the sole provision, sometimes only one feature of a larger plan. The degree of ability necessary for admission is not uniform, but the more commonly accepted standard is one that cannot be met by more than five or ten children out of 1,000. The purpose of the opportunity class is not to stimulate pupils to accomplish more work of the usual kind, but rather to develop the intellectual initiative that will enable them to work on a higher level. Drill and other forms of routine are reduced to a minimum. Complete freedom of movement is allowed. For the greater part of his time each pupil works at a project of his choice, either alone or in co-operation with one or more classmates. The spirit of enquiry and research is cultivated by extensive use of libraries, laboratories, shops, museums, field investigations and other teaching aids. It is possible to find twelve-year-olds in these classes who are functioning at a higher intellectual level than does the average college student. Curiosity is aroused, habits of idleness are overcome, and the occasional gifted child who was a social misfit in the ordinary classroom makes a normal adjustment. Opportunity classes are rapidly increasing in number and will doubtless become an accepted feature of city school systems.

SUPER POWER. The term has come into wide use, particularly in the United States, in connection with the extensive development of the electric power industry. It has been defined as "the systematic grouping and interconnection of existing power systems to the end that greater economy will be effected." It means in its final form, generation at large, highly efficient plants, transmission in bulk at very high voltage, such as 220,000 volts and supply to existing power systems in large blocks. It may be regarded as a power bank in which deposits and withdrawals are made at widely different points. Technically, the basis of super power lies in the economy effected in interconnecting systems with peak loads coming at different times, thus reducing spare capacity and therefore investment, and bettering the load factor of the interconnected generating plants. (*See* ELECTRICAL POWER TRANSMISSION; ELECTRICITY SUPPLY.)

SUPERSTITION. Like many words having a derogatory sense, "superstition" is often loosely and vaguely used, and is therefore not easy to define. To identify it, for example, with false belief or practice would be quite misleading. For in the first place, the field in which superstition is generally to be found, the magico-religious, is the very one in which the standard of truth and falsehood is most subjective and fluctuating; in the second, a custom or belief, religious or not, which is false may nevertheless be accepted at some times and places by men of enlightened intellect and conscience. To call a person superstitious, however, regularly implies more or less definite mental or moral deficiency. Thus, we should describe a man as superstitious who in a modern European or American community seriously believed that to break a mirror brought bad luck; but the original holders of that or a similar belief were perfectly reasonable in their views, according to their lights. Supposing that a shadow or reflection was in some sort a part of the soul, they naturally concluded that to break it, by breaking the substance upon which it was cast or reflected, was to injure the soul or life itself. They had merely been misled by a false inference. In like manner many savage customs and ideas, often described as superstitious by explorers or missionaries, turn out on investigation to be the product of quite sound reasoning, vitiated by the false premises on which it is based. To adhere irrationally to these premises after having their falsity clearly demonstrated might indeed be called superstition.

The word in question being of Latin origin, light may be thrown upon it by the usage of a Latin author. Vergil, in a well-known passage (*Aen.* viii. 187), characterizes *superstitio* as *uana* (empty, groundless) and also as *ueterum ignara deorum* (having no knowledge of ancient gods, *i.e.*, of well-tried and long-established religious ideas). If we turn to the Greek equivalent δεισιδαιμονία, literally "fear of superhuman powers," we find Theophrastos (*Characteres*, 28–[16]) ridiculing the δεισιδαίμων, not for holding polytheistic views nor for believing in omens, but for spending much time in the worship of obscure and foreign deities, and paying a ridiculous amount of attention to petty omens, such as a more sensible man would disregard.

We may now perhaps attempt to define superstition as *the acceptance of beliefs or practices groundless in themselves and inconsistent with the degree of enlightenment reached by the community to which one belongs.* It is clear that such a definition excludes, for instance, the mental attitude of one who, about the year A.D. 50, or in the middle ages, believed in astrology, which was accepted and defended by many, though not all, intelligent and well-educated persons of the time; it also excludes the action of a savage who adores what is to Europeans a ridiculous and non-existent godling. But it includes, for example, those contemporaries of Plato who let themselves be deceived by the lower practitioners of Orphism, or by those moderns who appear seriously to believe in mascots. Even so, a certain element of vague-

ness is unavoidable, since agreement is far from being reached as to what ideas, and consequently what practices, especially those having reference to things not obviously material, are false and unenlightened. A long list might be drawn up of things which some would regard as false and outworn, others as plausible or even certainly true; it would range from theistic belief and religious observances of any sort to such matters as second sight and dowsing or water-finding. There still remain, however, a great number of ideas and actions which the consensus of educated modern opinion would regard as superstitious in the sense above defined. These remaining superstitions fall into two categories, *survivals* and *accretions*.

Survivals.—It is well known (*see* ANTHROPOLOGY, FOLKLORE) that a great many customs characteristic of a less advanced stage in social and intellectual evolution survive into higher stages, either as meaningless and fossilized customs or because a new significance and use has been found for them. Thus many performances originally magical survive, more or less modified, as games for children or adults; a new use, the satisfaction of the play-instinct, has been found for them, but in their details they show, on investigation and comparison, traces of their original purpose. Again, the very old Northern European custom, in origin probably a fertility-rite, of decorating the house with greens at Christmas, survives simply because it is a pretty and picturesque traditional usage. Some such customs have become matters of etiquette. The need being still felt for some kind of conventional gesture to express friendly feeling or desire for better acquaintance, the old, probably magical, gesture of "handshaking" is still in use, and from childhood, we are taught to use the right, or lucky, hand for the purpose. The reason now given is that it is polite to use the right hand rather than the left; here as in many other instances what is now polite was once magically good. Such things as these can hardly be called superstitions, certain customs being still found necessary in various spheres of modern life, and the old ones being in themselves inoffensive, it saves mental effort to retain them, although their original meaning was something quite foreign to our conceptions. But alongside of these some things survive which are useless or even obnoxious, on any theory of conduct, expressed or understood, save one involving some now exploded doctrine.

A good example is furnished by rest-days. The whole experience of mankind proves that it is advantageous to have occasional periods in which no avoidable work is done, since in the end the worker actually achieves more than if he had not rested, in addition to tiring himself much less; and for this there are sound physiological and psychological reasons. Moreover, it is the perfectly reasonable practice of members of the higher religions, such as Christianity and Islam, to set apart certain days (Sunday, Friday, etc.) for the intensified practice of their worship. But it is well known that, long before either an ethical religion appeared or the physiology of fatigue was studied, tabu-days, like the *gennas* of the Nagas, were observed by people in a savage or barbarous stage of culture, owing to the belief that, at regular or irregular intervals, the prevailing conditions were so magical that ordinary work would be unlucky or would prevent or hinder the beneficent effect to be expected from these conditions. Now the feeling that on certain days certain occupations, or all ordinary occupations, are particularly unlucky (or lucky) is quite common at far higher stages than these. Those who appear seriously to believe in the unluckiness of Friday for starting any work may rightly be called superstitious, for the ground of their conduct is ultimately the savage notion of the incompatibility of ordinary occupations with the spiritual atmosphere, so to call it, of a tabu-day, in this case a Church fast-day of comparatively modern origin. Not dissimilar considerations apply to the quite wide-spread avoidance of the number thirteen, ultimately based upon very ancient ideas of the peculiar character of this number.

Accretions.—Evidence of the survival, among a civilized population, of a savage type of mentality is furnished abundantly by the occurrence of quite new superstitious practices in our own day and in circles, not always uncultured, of Europeans and Americans. It is of course a commonplace that gamblers are superstitious, and many of their practices may fairly be deemed survivals, such as turning a chair around to "change the luck" (imitative or homoeopathic magic) or wearing a mascot (fetishism?). But examples are not wanting of entirely new beliefs, based upon modern conditions and having no near parallel in savage or ancient custom. A popular English newspaper finds it necessary, owing to its large circulation, to employ a number of presses. In order to check, and, where necessary, correct the work done by each of these, it has its title printed in a slightly different manner by each machine, the difference consisting of a varying number of small white dots in the large black lettering. A few years ago a firm belief grew up among its less instructed readers that these dots conveyed racing "tips"; thus, if there were three dots in the letter D, they signified that in the third race of that day a horse whose name began with D was the likely winner.

Here we have a definitely superstitious belief, although connected with no magical or religious idea, old or new. Clearly such a delusion would have been impossible but for two factors. (1) Instead of rationally crediting the paper with the possession of a good deal of information on various subjects, gathered through reporters and by other such means, these readers manifestly supposed it to have a quasi-omniscience, embracing such unknowable things as the result of a race not yet run. (2) Whereas it is in fact the custom of newspapers to state in plain language, in their sporting columns, which horse they think likeliest to win a given race, it seems to have been vaguely felt that it was more in keeping with the supposed oracular and infallible wisdom of the Press to adopt a symbolic style and set forth valuable information in a riddling form.

The above example throws some light on the question whether superstition is declining in modern civilizations. The statement that it is rapidly disappearing is often and confidently made; but on examination of the instances given in support of such assertions, it will be found that what are really disappearing are certain old and traditional forms of belief or custom, which have rather gone out of fashion than been overcome by reason. For example, in Britain and America very little is left of the old rites connected with the last sheaf. This is only partly due to the spread of education among country people, probably not many farm labourers could say either what the old rites were or why they were irrational, it is rather the result of the rapid drift of population towards industrial centres, and the consequent influence on the country of town ideas. Now the townsman, not being a producer of foodstuffs from the soil, is apt to laugh at the customs connected with them as rustic; compare the contemptuous tone of such words as *rustre*, *rusticus*, *boor*, *ἄγροικος*, etc. The irrational custom has been irrationally displaced. Here, therefore, is no evidence of the growth of a more logical and critical mentality, less prone than the old to superstition; and it has already been shown that superstitious beliefs are actually in process of creation in the towns themselves. To take another example; while the traditional belief in witches seems practically confined to a few country districts and small towns, and the old methods of divination hardly survive at all, save as amusements, fortune-telling by various methods, mostly pseudo-scientific, including a crude and degraded form of astrology, is by no means extinct, as may be seen by examining the advertisements of popular magazines and also the police-court reports. At best it may be said that superstition appears to be yielding, although very slowly, to the gradual rise of the average intelligence which there is some reason to suppose exists, and that it may in time disappear with other irrationalities.

BIBLIOGRAPHY.—For classical superstitions, *see* art. ABERGLAUBE in Pauly-Wissowa, *Realencyklopadie*. For others, *see* ANTHROPOLOGY, FOLKLORE, bibliography. A comprehensive work on superstition in general is still a desideratum.

SUPER-TAX. A British tax imposed by the Finance Act of 1909 in which D. Lloyd George made a further graduation of the existing income tax by imposing a supplementary income tax or "super-tax" upon persons whose incomes exceeded £5,000 a year. This tax was not imposed upon the whole of the income but upon

such part of it as exceeded £3,000 a year, thus creating a graduated super-tax. In later years this super-tax was amended again and again, and in 1928 was renamed the surtax. (*See* INCOME TAX: IN PRACTICE.)

SUPERTONIC, in music, the second degree of the diatonic scale, as D in the scale of C, that is, the note next above the tonic, whence its name. (*See* HARMONY; INTERVAL.)

SUPILO, FRANO (1870–1917), Yugoslav statesman, was born of poor Croat parents at Cavtat (Ragusa Vecchia) in southern Dalmatia. In 1900 he became editor of *Novi List,* a Croat paper published at Fiume, which became a rallying ground for opposition to the intolerable régime of Count Khuen Héderváry. In 1905, together with Trumbić, Čingrija and Smodlaka, he drew up the resolution of Fiume, which became the basis of political co-operation between Serbs and Croats in the critical period before the World War. When the Magyar coalition parties came into power in Hungary in April 1906 and placed the Serbo-Croat coalition in office at Zagreb, Supilo became a deputy at Budapest.

Within a year Magyarising tendencies produced an acute conflict between Budapest and Zagreb, and for a time Supilo was the soul of Croat resistance. He thus became a marked man and was specially aimed at in the notorious forgeries by which the Austro-Hungarian Foreign Office attempted to prove Serbia's revolutionary intrigues in Croatia and thereby to justify the annexation of Bosnia in 1908. At the Friedjung trial, however, in Dec. 1909 Supilo was triumphantly vindicated. He was the first to discover the secret negotiations with Italy which culminated in the Treaty of London (April 26, 1915) and earnestly warned Sazonov of the disastrous complications to which it would give rise; but he was unable to prevent the promise of wide Slav territories on the Eastern Adriatic to Italy in the event of victory. Supilo came into conflict with the Pan-Serb and reactionary tendencies of Pašić, and even withdrew from the Yugoslav Committee, which in the early stages of the War he regarded as unduly subservient to Belgrade. But before his premature death (in London, Sept. 23, 1917) he heartily endorsed the Declaration of Corfu, issued in July 1917, which laid down the lines upon which the Yugoslav State was to be constructed.

SUPPÉ, FRANZ VON (1820–1895), Austrian musical composer, whose real name was Francesco Ezechiele Ermenegildo Suppé-Demelli, was born at Spalato, in Dalmatia, in 1820, and died at Vienna in 1895. Originally he studied philosophy at the university of Padua, but on the death of his father devoted himself to music, studying at the Vienna conservatoire. He began his musical career as a conductor in one of the smaller Viennese theatres, and gradually worked his way up to be one of the most popular composers of ephemeral light opera of the day. Outside Vienna his works never won much success. Of his sixty comic operas *Fatinitza* (Vienna, 1876; London, 1878) was the most successful, while *Boccaccio* (Vienna, 1879; London, 1882) only enjoyed moderate favour. Suppé's overture to *Dichter und Bauer* is his most successful orchestral work. He also wrote some church music.

SUPPLEMENTARY ESTIMATES: *see* ESTIMATES.

SUPPLY, provision; more particularly the money granted by a legislature to carry on the work of government. In the United Kingdom the granting of supply is the exclusive right of the House of Commons, and is carried out by two committees of the house, one of supply and the other of ways and means (*see* PARLIAMENT). In the United States supply originates in the House of Representatives (*see* UNITED STATES: *Appropriation*).

SUPPLY AND DEMAND. Economics, or political economy, is sometimes defined as the science of supply and demand. Although this is an inadequate definition it cannot be said to be altogether misleading. A very important part of Economics, and the part which probably has the best title to the name of science, has to do with the operations of supply and demand and with the way in which variations of supply and demand are related to the movements of prices and to changes in the production and distribution of wealth. The "law of supply and demand" was not invented or discovered by the economists, however, nor do they lean very heavily upon it as a general explanatory formula. Long before there was any systematic analysis of economic processes men had observed that prices vary with supply and demand, and from the earliest days, traders have had to take account of that circumstance. The economist's task has been to scrutinize those characteristics of human behaviour and of the physical environment which determine the various forms or patterns in which supply and demand appear and to inquire into the complicated interactions of the demand for and the supply of different commodities and services.

Elementary Principles.—Consider the familiar theorem that the price of a commodity must be such as to make supply and demand equal. If supply is taken to mean the amount sold and demand the amount bought the theorem is mere tautology, for supply and demand become different names for the amount transferred from sellers to buyers at any price whatever. But if it be understood that demand means the amount which buyers would be willing to take at a specified price, that supply means similarly the amount which sellers would be willing to part with at a specified price, and that demand and supply vary in some systematic and continuous way and in opposite directions as the price is raised or lowered, the theorem has meaning and significance, for there will be one price, and only one price, at which supply and demand will be equal.

In another elementary theorem, namely that an increase of demand for a commodity will raise its price, that an increase of supply will lower it, and that a decrease of supply or of demand will have an opposite effect, other meanings are attached to changes of supply and demand. Here an increase of demand or supply means an increase of the amounts which will be taken at given prices, not an increase which is dependent upon a reduction of price. The general state of supply and demand, in the sense specified in the preceding paragraph, can be represented by lists or "schedules" of "supply prices" and "demand prices." In this other sense, however, supply and demand are regarded as independent variables, and a change of supply or demand means an alteration of the schedule of supply prices or demand prices, such as might come on the one hand from a change of consumer's preferences or an enlarging of the market or, on the other hand, from a change of costs of production.

It is proper to assume that at any given time the immediate general condition of supply might be represented by a schedule in which the progressively higher prices which are required to evoke a progressively larger supply are set forth. But if the commodity is one which can be produced more economically if produced in large quantities, the ultimate effect of an increase of demand, in the sense of an increase of the amounts which will be taken at specified prices, will ordinarily be to reduce the price per unit at which these larger amounts will be supplied. In a schedule of supply prices constructed on the assumption that sufficient time is allowed to permit the necessary economies to be effected, larger supply will be associated with lower prices. When the long-period schedule of supply prices is of this type, the commodity is said to be produced under conditions of decreasing costs or of increasing returns. When, on the other hand, because of the scarcity of some necessary productive factor, increased supply cannot be had, even in the long run, except at a higher price, the condition is described as one of increasing costs or of diminishing returns. The factors which give rise to increasing returns should not be confused with the circumstance that in many industries certain outlays (*e.g.,* for plant and equipment) have to be incurred in advance or with the further circumstance that in a growing industry such outlays are ordinarily considerably larger than the volume of output immediately in prospect would require. Under such circumstances the additional or "prime" costs incurred by reason of an increase of output may be relatively small. Furthermore, with a progressive increase of output there will be a progressive diminution of costs per unit of output, because the general, supplementary, or "overhead" costs will be spread over a large number of units. But although when the market is sluggish or when competition is especially keen, prices may be cut to a point where they barely suffice to cover the addi-

tional or "prime" costs, this condition, which cannot be lasting, should not be confused with a true condition of increasing returns, for this last condition is to be found only when a gradual increase of output is attended, in the long run, with genuine economies.

Interactions of Supply and Demand.—The results obtained by taking account only of the supply of and demand for a particular commodity in relation to its price are no more than a first approximation to the truth. In isolating, for reasons of practical convenience, the factors which determine the price of any one commodity, taken by itself, economists are accustomed to assume that the value of money, to both buyers and sellers, is constant. This means that no account is taken of the way in which changes in the amount of money which consumers expend for the one commodity will affect their ability to buy other commodities, or the way in which an increase of the production of the one commodity will affect the ability of producers to supply other commodities There are many instances of joint or complementary demand, as for fruit and sugar or for automobiles and petrol, and of joint supply, as of mutton and wool, of coal-gas and coke, of cotton and cottonseed The general rule is, however, that consumers' outlays for any one commodity can be increased only by reducing the amounts which they expend for other commodities, and that more of any one commodity can be produced only by displacing other possible uses of productive resources. This general rule is not inconsistent with the fact that, making abstraction of the use of money as a medium of exchange, the supply of any one commodity is an expression of the demand of its producers for other commodities and services.

There is a sense in which supply and demand, seen in the aggregate, are merely different aspects of a single situation It is for this reason that some of the older economists held that general overproduction is impossible—a theorem which, though not really erroneous, has proved to be misleading. The *effective* demand of the producers of one commodity for other products depends not only upon how much they produce, but also upon the relative demand of other producers for that particular commodity as compared with other products Only so far as the demand for a particular commodity is elastic is it true in any significant sense that an increase of its supply is an effective increase of demand for other commodities There may be and often are maladjustments of supply and demand Furthermore, production in general may at one time outrun and at another time fail to keep pace with the expansion of money incomes. In either event there will be general fluctuations of prices, attended, as experience shows, by changes in the relative levels of the prices of different classes of goods and services.

The general form of the relations of supply, demand, and price which obtain when all products are taken into account can be depicted mathematically in systems of equations, and thus the general character of the whole interdependent structure of prices can be laid bare But empirical (statistical) studies of the relations between the fluctuations of the production of various staple commodities and fluctuations of their prices have shown that the first approximation previously referred to is generally a useful and often a surprisingly accurate approximation. It is necessary, of course, to allow for the effects of contemporaneous changes of the general purchasing power of money, and it is sometimes necessary to allow also for the effects of other important disturbing circumstances But it is not necessary to take account of complications of a secondary order of importance in order to obtain "empirical laws of demand" for such commodities as wheat, cotton, sugar, beef and potatoes which appear to be fairly reliable, at least over periods of some years.

Inelastic Supply.—The rule that supply and demand may be regarded as functions of or dependent upon price must be so interpreted, of course, as to allow for the circumstance that the supply of something is fixed and is in no way responsive to an increase of price. As the production of other goods increases the prices of these non-reproducible forms of wealth must inevitably increase, unless the demand for them falls off. If these non-reproducible things are necessary instruments in the production of other goods, as land is, then other goods will be produced under conditions of diminishing returns, unless this disadvantage can be offset by improvements in productive processes or by cheaper supplies of other necessary productive instruments For some purposes it is convenient to assume that the aggregate supply of reproducible goods, or of reproducible productive goods, is fixed for the time being. The problems of supply and demand then have to do merely with the apportioning, by exchange, of an existing stock of goods, or with the assigning of productive instruments to the most important of their various possible uses. Thus the increase of the supply of labour in a given industry or a given locality may be taken to depend largely upon a possible transfer of workers from other industries or other localities. Whether labour in the aggregate may be said to have a supply price (*i e*, to be responsive in the long run to an increase of wages) is a question to which the Malthusian theory of population gave a more nearly unqualified affirmative answer than would be supported by the present opinion of scholars. (*See* also DEMAND, ECONOMICS, and PRICE) (A Yo.)

SUPPLY AND TRANSPORT, MILITARY. In all ages the operations of armies have been influenced, and in many cases absolutely controlled, by the necessity of providing and distributing food, forage, munitions, and stores for men and horses In modern history these supplies have become more and more varied as weapons developed in complexity, power, and accuracy of workmanship In proportion, the branches of an army which are charged with the duties of "supply and transport" have become specialized as regards recruiting, training, and organization, in consequence also of the progress with transport which provides more reliable and efficient haulage

HISTORICAL

The predatory armies of the middle ages not only lived upon the country they traversed but enriched themselves with the plunder they obtained from it, and this method of subsisting and paying an army reached its utmost limits in the Thirty Years' War During the last stages of this war Germany had been so thoroughly devastated that the armies marched hither and thither like packs of hungry wolves, every soldier accompanied by two or three non-combatants—camp followers of all sorts, mistresses, ragged children, and miserable peasants who had lost all and now sought to live by robbing others under the protection of the army

From these horrors there followed a revulsion to the other extreme Unless ordered by higher authority for political reasons to sack a particular town or to pillage a particular district, the soldiers were rigidly kept in hand, rationed by their own supply officers and hanged or flogged if at any moment an outbreak of the old vices made the example necessary. After 1648 there were very few districts in Middle Europe that could support an army for even a few days, and the burden of their sustenance had to be distributed over a larger area. Thus, at the mere rumour of an army's approach, the peasantry fled with all their belongings into the fortified places; armies soon came to be supplied from "magazines," which were filled either by contract from the home country or by inducing the peasantry—by means of good conduct and cash payments—to bring their produce to market These magazines were placed in a strong position, and if one was not available, a siege had to be undertaken to meet the demand

Moreover, soldiers in Marlborough's time were not so easily obtained as in the Thirty Years' War, and they had to be housed and fed comfortably enough to make it worth their while to stay with the colours instead of deserting. From these and similar conditions there grew up a system of supply and transport usually called the "magazine system," under which an army was bound, under penalty of dissolution, to go no farther than seven marches from the nearest fortress, two days from the nearest field bakery, and so on When an 18th century army foraged for itself it was because the regular supply service was interrupted, *i e.,* when it was *in extremis* But the relative rarity of wars in the 18th century, the habit of demanding nothing from the inhabitants of the country traversed by an army, and the virtual exclusion of the people from the princes' quarrels, gave Europe a century's

respite in which to recover from the drain of the Thirty Years' War. And therefore, when the French Revolution came, the attempts of the armies of old Europe to suppress it without robbing a single Frenchman of a loaf of bread proved futile, and soon the national army created by the Revolution, unencumbered by tents, magazines, and supply trains, swept over southern Germany and Italy. The Revolutionary armies differed indeed from those of the old wars in this, that they did not devastate wantonly, nor did they murder for the sake of loot. But they were merciless in their exactions, and, moreover, the tides of their invasions flowed in particular channels, so that the greater part of the invaded country escaped. This had a considerable, sometimes even a predominant, influence on the strategy pursued, a retreat along their own lines of communication being often in fact avoided by the French as being the worst fate that could befall them. Napoleon, however, systematized the wasteful and irregular requisitioning that his predecessors had introduced, and in his hands the supply service, like all else connected with the art of war, underwent a thorough reform. His strategy[1] in the offensive passed through two distinct stages—(*a*) the swift and sudden descent into the theatre of war, and (*b*) the close grouping of his armies in view of the decisive blow. The first stage was characterized by extraordinarily swift movement, freedom from dependence upon supply columns (other than the reserves of ammunition) and thorough exploitation of the food resources of the traversed zone. If the troops suffered, as well as the inhabitants, this effect did not shake his purpose. But the second stage, which as a general rule involved three or four days' occupation, without considerable movement, of a restricted area, required other measures of supply. In this the army lived upon magazines, which were filled from the captured supply transport, from the available supplies in the area, and from the resources accumulated in requisitioned vehicles close to the head of the routes followed in the first period. These resources were collected in the towns within this concentration area, and placed "out of reach of an insult" (that is, made safe against raiders) with a garrison and field works to supplement the town walls and gates. From this *centre of operations* Napoleon never allowed himself to be severed, whereas to the preservation of the route between France and that centre of operations he gave very little thought and assigned few or no troops, and confusion of strategical thought has often ensued from a failure to perceive the essential distinction, in Napoleonic practice, between a centre of operations and a "base."

In the 19th century, however, there came the inevitable reaction. Purely political wars, and the consequent indifference of the inhabitants to the operations of war, produced as before a return to the system of cash payments and convoy supply, especially in the Austrian army. As regards Europe, the introduction of railways enormously facilitated the supply and transport service, and campaigns were neither as barren nor as prolonged as they had been under the old conditions. The French and British armies did not, at least to the same extent, wage political wars, but their ceaseless colonial warfare imposed upon them the magazine and convoy system, and habituated them to it. The French, in 1870, stood still in the midst of the rich fields of Lorraine, and as a prolonged halt is fatal to the system of living on the country, it would have failed, even had it been tried. The Germans, on the other hand, levied requisitions, civilian transport, and contributions in money in accordance with Napoleonic tradition, though (owing to the existence of railways) with much less than Napoleonic severity. Their system was adopted as the best for European warfare by all the great Powers, whose organizations and methods of transporting and issuing supplies became the same in principle.

This principle was based on the Napoleonic distinction between supplies required during an advance and those required during a concentrated halt.

This system has been considerably modified by the immense development of mechanical transport. The principle of supply now followed is that "field units should always have with them or within reach two days' rations and forage and an iron ration, and that the supply service should keep these stocks replenished by delivering one day's rations and forage every day at a point within easy reach of the troops."

[1]H. Camon, *Guerre napoléonienne.*

No hard and fast rule can be laid down as to the source from which supplies shall be drawn, and all local resources are utilized as fully as possible in order to save unnecessary transport of supplies from the base. Food collected from local resources during a period of concentration will usually be stored in supply depots for subsequent issue to the troops. Such supplies should first be drawn from those districts adjoining the immediate area of concentration through which the army will not pass. Supplies within the area of concentration are left, as far as possible, for the use of the local inhabitants.

Generally, then, a force operating in Europe would be maintained in food, forage, fuel, and petrol from the base by rail and mechanical road vehicles, due allowance having been made for such supplies as can be obtained locally by formation supply officers, by purchase, or on requisition. As regards requisitioning, the rule is that only officers of a service detailed for the duty are authorized to purchase or requisition, but in cases of emergency requisitions may be carried out by the officer commanding the troops for whom the supplies are required. Authority to requisition is not delegated to any but a commissioned officer, and requisitioning on the part of a warrant officer, n.c.o., or man is treated as plundering, unless the case is one of extreme urgency and no commissioned officer is present. All purchases and requisitions should be made through the local civil authorities. Mobile reserves of supplies do not normally exist but would be found from reserve mechanical transport units and allotted to formations to meet special circumstances. When it is impracticable for a force on the move to be reached by a daily supply convoy, it will usually be accompanied by a supply column carrying supplies for several days. In such a case the radius of action of the force is limited by the amount of food accompanying it.

In savage or undeveloped countries the conditions are far less favourable and each case has to be dealt with on its merits. Such warfare formerly used to necessitate an almost complete dependence on magazine supply, as communications were necessarily uncertain and difficult. These conditions are more or less being overcome by the development of cross-country mechanical vehicles. Nevertheless the supply difficulties in expeditions in the Sudan, West Africa, or on the Indian frontier still far outweigh all difficulties of country or enemy. (X.)

THE WORLD WAR: WESTERN THEATRE

The administration of supply and transport became of the first importance as the World War developed into a struggle between two groups of nations, each using the full resources of civilization to exhaust the other. In the last stage, supply was the determining factor; munitions, food, equipment, railways, roads, ships, had become the most important things, and victory inclined to the force which could best maintain supply, as well as men, at some particular point; which could best develop, conserve and transport its material. At the same time, in foodstuffs, forage, clothing, timber and metals, and in transport material, the world shortage was acute. Thus the work of administration was not only very heavy because of the number of combatants and the development in scale of equipment, but also because of the economic scarcity owing to world exhaustion.

Position in 1914.—When the armies first took the field in 1914, Germany was at a clear advantage. She had prepared for the war with meticulous care. The French administrative services in 1914 appeared much weaker than the German if examination were confined to plans and *matériel*. The troops were not as well provided for, the transport organization not as well planned. But if the human factor were taken into consideration, much of the handicap was made up. The French showed a genius for improvization on the actual battle-field and a faculty for "getting there" with inferior means. Their food scales for man and beast (to give an example) spelt scarcity in British eyes: but they sufficed. The British administrative services in 1914 were well organized both in supply and transport. But the British force was small, and though its scale of transport was generous compared with the French, the total was only 250 motor-cars, 950

motor-lorries, and 40,000 horses. With railway transport it had at first no concern, as the French took charge of that

Progress During the War.—As the war developed, the Germans suffered from a steady deterioration as compared with the French and the British. The war had become a contest of *matériel,* in which Germany could not keep up The French, on the other hand, were able to develop their supply and transport on more generous lines with the help of British and American resources. The British developed a complete machine of administration, helped by the fact that the nation took the view that all reasonable expenditure was justified in securing for the troops the best possible chance of victory and the best possible comfort in the trenches. But the Germans, considering the depletion of their resources, kept up a wonderful efficiency in supply and transport They realized, perhaps more clearly than the other armies, the importance of these services

Siege Warfare Conditions.—During the long period of "trench warfare" which followed the battle of the Marne, the administrative systems of the three armies were adapted to new conditions, the chief of which were an enormous increase of ammunition expenditure, and a great simplification of transport, which in a stabilized warfare could follow almost a civilian routine disturbed only by the chances of shell fire and aerial bombs Administration thus, whilst it had to cope with the progressive increase in the scale and variety of supply per division, was given as a rule ample time to increase its transport facilities It could add to its broad-gauge railway tracks, supplement them by light railways and tramways as well as by motor roads, and develop the canal systems as useful adjuncts As the war opened out, with the development of great attacks on both sides, problems of supply and transport became more difficult In facing such a German effort as the Verdun attacks of 1916, the French had a very difficult problem of transport, which was met by a motor-lorry mobilization, the success of which was one of the great feats of the war

Re-organization of British System on Western Front.—From 1914 up to the date of the first battle of the Somme (July 1916) the British administrative services had had no very severe tests, but had developed their system almost completely In munitions, the British army was now better supplied than any other force in the field It had control of its own railway services, and supplementing the French broad-gauge railway system on its front—which it had taken over and increased—had a system of light railways, and a greatly increased scale of motor transport But the Somme battles showed that supply had been increased beyond the scale that transport could cope with There followed in Nov 1916 a reorganization of the system One feature of this reorganization was good The division of authority which put the administrative services really under two heads, one for the battle area and one for lines of communication, was done away with The military railways, which had been hitherto somewhat starved, were reorganized according to the plans of a civilian expert and were generously supplied with staff and material But here, what proved in the result to be a mistake in organization was made railways were separated from the control of the quartermaster-general (who kept control of other forms of transport) and put under a director-general of transportation. Thus there were two separate transport authorities

Errors of Dual Control.—After the battle of the Somme the line was practically stable for a long time. Whilst this almost stationary trench warfare continued, the weakness of the division of authority and the mistake of allowing any but the military idea to rule in an essential part of an army organization were not apparent When the Germans attacked in the spring of 1918 the mistake showed very clearly, and the railways were brought again under the control of the quartermaster-general, after an interval during which the traffic to be carried and its priority was regulated by a committee composed of staff officers and officers of the transportation directorate. But the transport situation in the interval was very critical The German advance had brought the British front lateral railway—St Just-Amiens-St. Pol-Hazebrouck—under shell fire at many points The Germans, whose strategy under Gen. Ludendorff was dominated largely by transport considerations, sought to paralyse completely the whole railway system by continuous air attack on the British rear lateral—Eu-Abbeville-Étaples, especially at the points where it crossed the rivers Canche and Somme. Whole-hearted work in building "avoiding" lines and bridges and the efforts of the motor transport just kept the position in hand until a British advance in front of Amiens relieved the front lateral. Fortunately, the building up of a G H Q reserve of motor vehicles had just been brought to completion.

Motor Transport System.—In the winter of 1917–18 the battles of Passchendaele had exposed a weakness in light railways—that they had to work along defined tracks which could be intensively shelled by the enemy—and therefore it was decided to trust more to motor transport. There was effected a complete reorganization of it, with the central idea of doing away as far as possible with the "earmarking" of motor vehicles for particular units or particular tasks and making its total strength completely mobile and elastic. Vehicles saved by this "pooling" were formed into a G H Q motor reserve. In the spring of 1918 this G H Q motor reserve was able to take up part of the traffic load and was largely responsible for saving the situation.

Transport Values.—One of the most interesting problems of supply and transport is that of the relative value of roads (motor and horse traction), light railways, and broad-gauge railways Light railways (*q v*) at one stage of the war were perhaps over-estimated There was an inclination to regard them as all-sufficing The British system ultimately gave to them what was considered their proper rôle, recognizing that they were most valuable when the fighting line was stabilized for some length of time, but tended to be less valuable as the war became one of movement. In the spring of 1918 the British army had 920 m of light railways in operation; in the summer, 100 m less Its advance was planned on the principle of concentrating labour in pushing forward the broad-gauge railways and then the roads from them, trusting to motor transport and to horse transport to carry on the load from broad-gauge railhead Earlier in 1918, controversy on the subject was keen and the French were inclined to take a differing view The Germans were tied to light railways, for they had not the means to extend their motor traction

Position in 1918.—The autumn of 1918 will be the most useful date to compare the administrative machines of the Allied armies Both French and American systems kept a dividing line as regards administration between base and the fighting line The British system had abolished that in 1916 The French divided the zone of the armies into the zone of the advance and the zone of supply (with sometimes an intermediate zone) In the zone of the advance, administration was in charge of the *aide major-général chargé de la direction de l'arrière* at headquarters. But his administration had no functions of procurement, only of distribution In some points of administration the dividing line between the zone of advance and the zone of supply was abolished, *e.g*, all motor transport and all light railways, wherever operating, were controlled from headquarters. The French system of supply and distribution was fashioned for war in the home country or near to it; when it was transplanted (for instance to Salonika) it was adapted nearer to the British system. The American system put administration on the fighting line under an assistant chief of staff (G 4) at G.H Q, and on lines of communication under a general commanding service of supply (corresponding in some degree to the old British inspector-general of communications) Under the American system the chiefs of the supply service were not at G H.Q. but at the headquarters of service of supply

With both the French and the American systems, evacuation and hospitalization of casualties were purely "Q" services; in the British army they were under the adjutant-general, assisted by the quartermaster-general Some other differences came from geographical conditions. The Americans had to have their real supply base in France (for the British, the United Kingdom, and for the French, France was the ultimate supply base); so they held great stocks in depots, 15 days of supplies in advance depots,

30 days of supplies in intermediate depots, 45 days of supplies in base depots. The American army relied more largely on local purchases (from the Allied armies and from European civilian sources) than did the armies with their home bases nearer at hand. Gen. Pershing founded a general purchasing agency to control these purchases. In 1918, of 17,600,000 ship tons used by the American army, only 7,600,000 tons came from the United States, and 10,000,000 tons were purchased locally, and to the end of the campaign the American army drew largely upon British and French supplies.

Relations with Navy.—The British administrative machine in one point was inferior to the American machine in 1918. Under the British system the navy had control of all supplies by ship until discharged from the transport. The navy could put a supply ship into any port it pleased and naturally was mainly guided by shipping considerations. The American system put the supply ships under army direction when they came within the three-mile limit from shore, and shipping could then be directed to the port of supply which was most convenient from the army point of view. The French and the Americans used the railway regulating stations as depots, the British used them as sorting stations only.

Among the lessons of administration of the World War one principle seems to be generally accepted—that it is wise to centralize all administration of supply and transport under one head over the whole war area, trusting to him to devolve and co-ordinate. Another conclusion is that if civilization has ever to face another great war it will be, even more than the contest of 1914–18, a war of material, a struggle in which supply and transport will be the governing factors. (T. C.)

THE WORLD WAR: EASTERN THEATRES

Outside the main theatre in France and Flanders very different and varied conditions had to be encountered. In East Africa there was bush; in West Africa, tropical jungle; in Macedonia, and to a lesser degree in Italy, mountainous regions; in Palestine, Damaraland and Mesopotamia, deserts where sand or mud had to be overcome; in Gallipoli, amphibious operations on a vaster scale than had ever been attempted in modern times; while, in conditions, north Russia was entirely different from all these. It speaks volumes for the efficiency of the British transport organization and its adaptability that so kaleidoscopic a field was covered successfully, for the armies in the field were maintained in every instance except that of Gallipoli until complete victory was won.

Failures there were, and such failures arrest the attention, because of their very fewness.

The campaign in Mesopotamia presented circumstances which as late as 1917 were not adequately appreciated. Scarcity of water tied the army to a line of advance either by the Tigris or Euphrates, rivers which in themselves provided admirable lines of communication had sufficient inland water transport been made available. To the paucity in this respect, added to a similar dearth of land transport, may be attributed directly the failure, ending in the surrender, of the Kut garrison and of the gallant efforts made towards its relief. Troops at Basrah could not be moved, and if they had been moved means did not exist for their maintenance. Moreover the army, tied as it was to the river, was not endowed with the power to manoeuvre.

It is true that in the rainy season in lower Mesopotamia, movement is difficult or impossible, as the country becomes a vast sea of mud and no roads exist. Nor is any stone available in the country for road construction. The fact, however, remains that, had the army engaged in the operations for the relief of Kut been furnished with any appreciable amount of light mechanical transport, it would, through its increased radius of action, have been able to obtain its object. After the arrival of Gen. Maude, who from the first devoted himself to putting transport matters in order, the advance was resumed and maintained without any real pause until the occupation of Baghdad.

MODERN ORGANIZATION

Like every other component part of the military machine, the system of supply and transport for the maintenance of an army in the field underwent development as a result of the World War. The experiences gained therein had naturally served to quicken experimental work, and consequently the decade following the close of hostilities was one of intensive research in the field of road and cross-country transport. In these activities British authorities and experts, military and civil, have played a prominent part. The aim and end has been to produce a vehicle which, while answering all essential military requirements, would yet serve commercial needs. These interests are by no means easy to reconcile in thickly populated and highly civilized countries possessing complete road systems, but in the partially or altogether undeveloped portions of the British dominions or colonies there is and will remain a wide scope for transport of a cross-country nature. Such possibilities gave special encouragement to British experiment and production, so that by 1928 certain satisfactory types had been evolved, notably the "subsidy-type" six-wheeler with a chassis designed by the War Department, which it was found possible to produce at an economic cost.

To apply the results obtained to the army is the stage which is now being entered upon. But such application can be but a gradual process, not only on account of the dictation of finance, but still more from the fact that no finality can be reached in the fields of scientific and mechanical research and automobile engineering—the output of which is, therefore, continually subject to modification and improvement. It is axiomatic to British military organization to provide for the major problems that the army is capable of encountering and to modify or scale down such organization to meet minor or unusual circumstances as they arise. For the British army there can be no normal circumstances, for it has to be prepared to operate not only in Europe but in the deserts, mountains and bush of Asia or Africa; and no one system of transport has yet been devised that can cover all these various conditions. Certain general principles are thus laid down in the training manuals and a definite organization drawn up to fit the case of war in a civilized country where the enemy to be met is equal in armament and training.

This organization is based on the premise that an army operating in the field must be able to be maintained wholly by resources sent up to it from behind. The extent to which the theatre of operations can contribute to those resources cannot be a known factor. In proportion as they may be able thus to help contribute are the mobility and striking power of the army enhanced. Such extraneous assistance cannot, however, be counted upon. It is, too, obvious that for armies of the size of those engaged in France and Flanders between 1914 and 1918 no areas, however rich, could provide more than a fraction of the foodstuffs or other commodities required. Again, the advent of automatic weapons and the enormous advance in the power and use of artillery have made the problem of the supply of munitions one that can only be solved by speedier and more flexible transport establishments.

The progress made in mechanical traction and automobile engineering has rendered possible a recasting and extension of mechanical transport formations. Except in certain minor instances, mechanical transport was not, prior to the World War, included in any formation lower than the Army Corps. From some few traction engines working chiefly at the bases in South Africa in 1900 to 1902, mechanical transport steadily made its way forward from the lines of communication until it had reached, in 1914, the larger fighting formations. Post-war organization brought it into the division and it has now been introduced as an integral part of the actual fighting units throughout the whole of the army. The maintenance of such a mass of mechanical vehicles requires in its turn a comprehensive and closely developed organization composed of highly trained technical personnel. No loose or casual methods can suffice in fixing a system, which has necessarily such wide ramifications throughout the military organism; which system furnishes in fact the motive power by which the life of that organism is generated. Only by the soundness of its supply and transport methods can an army be endowed with mobility, and by mobility is meant not only the power to move rapidly, but the power to move anywhere and to continue moving.

Organization of the Supply Service in War.—The basic organization of the supply service, as far as food, forage and fuel, including petrol, are concerned, in any theatre of war consists of the establishment of a chain of depots into which flow those supplies which are received from overseas or obtained by purchase or requisition within the theatre itself. These depots are classified under four headings. *Base or main supply depots* are located at or near the base ports or bases of operations as the case may be *Advanced supply depots* are established when the lines of communications are unduly long, and these may be required to provide the daily supply for the troops based on them or may hold a reserve of supplies for use in the event of communication with base supply depots being interrupted *Field supply depots* are, when required, established in forward areas to be used primarily as a reserve to meet sudden unforeseen demands for supplies by field formations. These depots are often located at or near supply railheads (*i e*, the point on the railway where supplies and stores are detrained and sent forward in road transport), especially during a rapid advance, when it is necessary to push reserves of supplies continually forward Finally, there are the *intermediate supply depots,* which are situated on the lines of communication for the purpose of the subsistence and maintenance of troops on those lines, whether permanently located there or passing through In conjunction with all these supply depots there may be field butcheries and bakeries.

Ammunition Supply.—The essential difference between supply in the sense of food, forage and fuel on the one hand, and the supply of ammunition on the other, lies in the fact that the former is to all intents constant and regular and therefore must be maintained at a comparatively even flow, whereas the latter entirely depends on the intensity of the actual operations taking place, and is therefore spasmodic. The problem of ammunition supply is in itself the prime limiting factor in the development of the armament of the fighting troops, as it obviously serves little purpose to provide them with weapons that cannot be used to the maximum extent of their capacity.

Two main principles govern it. first, that ammunition must be passed systematically from rear to front and that therefore troops in action should never have to turn their backs on the enemy to fetch further supplies Second, that the control of ammunition should remain in the hands of higher formations as long as possible, thus enabling the higher commanders to keep control of the fighting. Ammunition depots are formed at the bases, on the lines of communication, and in forward zones Special ammunition "dumps" are located in areas where they are likely to be needed in proximity to the artillery positions, but as a general rule it is preferable when possible to maintain ammunition "on wheels."

Transport of Field Units.—This is divided into three classes.

1. *First line transport,* which is an integral part of the war organization of fighting units, without which they cannot perform their tactical functions, and by which they must at all times be accompanied. Provision, therefore, must be made for the carriage of certain stores, supplies and equipment, for ammunition, and for water and medical service. Whether this transport is on a carrier pack, animal, wheeled, or mechanical basis must depend on the nature of the terrain; and according to where units are operating so must they be equipped For the purposes of a "major" war, modern tendencies are towards a mechanization of first line transport, not only because of its lesser vulnerability to air and other hostile action, but also because of the possibilities it offers towards a general speeding up of movement and increased radius of activity.

2 *Second line transport,* which is essential to the war organization of field units, but by which they need not at all times be accompanied In the case of the fighting units of divisions and cavalry divisions, this transport is concentrated in and operated by transport units of the Royal Army Service Corps, designated divisional R.A.S.C., which are equipped with medium lorries The divisional R.A.S.C. consists of seven companies. One company is allotted to each of the three brigades in the division and one to divisional troops for the purpose of carrying supplies and baggage, in which therefore a total of four companies are engaged There is a divisional ammunition company and a divisional repair unit, by which all field repairs of the wheeled mechanical transport in the division and replacement of broken down or seriously damaged vehicles are carried out There is also a horse transport company, which is held available, in the nature of a reserve, in case ground has to be traversed that is impossible for mechanical transport.

3. *Third line transport* consists of "maintenance companies"—Royal Army Service Corps units equipped with heavy lorries. One company is provided for every division and cavalry division in the force, and for army corps troops, army troops and G.H Q troops in accordance with their requirements.

Working of the Supply and Transport System.—Supplies (and mechanical transport spare parts and stores) forwarded from the lines of communication are consigned by special trains to railheads, *i e*, the places where they leave the railway and are carried to their destinations by road On reaching railheads they are taken over by the railhead supply officer, who issues them to the "maintenance companies" serving the divisions allotted to that railhead. The maintenance companies load in bulk for the brigades of their divisions, and their duty is to carry their loads as far as what are known as "refilling points," spots previously selected for the meeting of the "maintenance company" and the divisional train The latter takes over the supplies for issue in detail to units of the division, and its duty is to carry them from the "refilling point" to "delivery points," that is, to the first-line transport of the individual unit Variations may and normally are made in this system by the insertion of "rendezvous" between railhead and "refilling points," and of "meeting points" between refilling points and "delivery points"; and such insertions depend on the nature of the operations, requirements of concealment from air observation, state of congestion of the roads, or the tactical situation at the time Thus there are normally two definite échelons of transport between units and railhead which are available for the purposes of supply This should permit troops to operate freely within 100 m. of railhead

The "mobile" supplies available are therefore as follows, assuming the issue of rations to be from mid-day to mid-day as is normally the case. On the man, his iron ration and any unconsumed portion of the previous day's issue In the regimental first-line transport, one day's supplies With the divisional R A S C, one day's supplies. The total therefore is from two to two-and-a-half days, excluding the iron ration

Turning to the question of ammunition, this is forwarded to ammunition railheads, located for various reasons quite apart from supply railheads The maintenance company conveys both artillery and small arms ammunition, as in the case of supplies, to "refilling points" At these the divisional ammunition company, which forms part of the divisional R A S C, takes over the ammunition in their medium lorries It normally carries the artillery ammunition to the batteries, but under certain circumstances it may be required to proceed to the divisional ammunition column—an artillery unit. The small arms ammunition is taken to the infantry or cavalry brigade reserve—this reserve being formed by a system of "pooling" a portion of the first-line transport of units These systems are specially designed to allow of elasticity. If distances are short, one échelon of transport may be dispensed with If they are long, it may be necessary to interpolate an additional échelon—the necessary vehicles being found by the higher command from army corps or army resources.

As previously emphasized, the state of communications or the lack of them may demand the employment of pack carrier or even air transport for the whole or a portion of the "carry." But whatever the mode of conveyance, the principles remain the same To sum up, they are. In the case of supplies, the maintenance within reach of the fighting troops of two days' complete rations and the "iron ration," and a daily delivery of one day's rations, petrol and forage to units. In the case of ammunition, the principle is to maintain, by a continuous replacement of expenditure, a definite establishment in rounds per gun, per automatic weapon, and per rifle throughout the échelons The maintenance system, in its application to non-divisional units, is similar to that described above Consequently, all types of fighting units are on the same

basis as regards first-, second- and third-line transport.

Conclusion.—It would seem that the advent of an efficient six-wheeled mechanical vehicle is likely to go far to revolutionize the methods of war. For once a vehicle independent of roads is introduced, the whole problem of movement and maintenance is "speeded up" beyond anything previously conceived. It is a striking instance of the all-pervading influence of "transport." No army can afford to maintain permanently more than a fraction of its transport or even of its purely fighting transport.

The problem has been to achieve a design that, while wholly meeting military requirements has yet an economic commercial value. The solution has now been found and the time has therefore come when the operations of armies can be carried out at a far greater speed than heretofore. For, like that of a fleet, the speed of an army is that of its slowest component unit, which up to now has been the legs of the infantry soldier. If action is quicker, then thinking must be quicker also. This involves a still closer co-operation and unity between those directing operations and those on whom the services of maintenance fall.

These conditions have in their turn produced their own special problems. The provision of the necessary skilled personnel to carry out these duties is likely to be a matter of grave difficulty in the future because the advent of "mass production" methods do not demand more than a comparatively low proportion of skilled mechanics and artificers among the employees of the great automobile engineering firms. The main processes of construction and assembly have been so simplified that they can be carried out by workmen not possessing any specialized training. Such a type of labour will be very far from satisfying war requirements, and for a "major" war any technical personnel possessed by the army will require to be supplemented from civilian sources.

There remains to recall the question of petrol supply. The storage and transport of this commodity, which is in fact the life-blood of the modern army, present special circumstances and difficulties to be overcome. With animal transport, possibilities normally exist for obtaining some measure of foodstuffs within the theatre of operations, while over limited periods animals can perform their duties on short rations or even at need occasionally on their own reserves of strength. No such conditions obtain with motor vehicles. Without petrol they cannot move at all. Should the supply fail for one day there can be no movement that day. The revolution of road transport by mechanization has in fact made "fuel supply" one of the most important questions.

THE UNITED STATES ARMY

The development of supply and transport in the U.S. army has followed that of war itself and the progress in rapid communication. We shall here consider only the evolution of this technique since 1917.

At the start of the World War the War Department found itself insufficiently organized for handling the great problems of supply and transport brought about by the enormous expansion of a small regular army into a national army of unexpected proportions. As a consequence, there came into being the super-agencies for war-time procurement, allocation, distribution and transport. The War Department itself supplemented the assistance of these superagencies by forming the purchase, storage and traffic division of the general staff, and by making its head the representative of the secretary of war in most matters before the various supercontrol agencies of the Government. This arrangement permitted an efficiency that would probably have been impossible otherwise. As the war went on it became necessary to form an air service, a motor transport corps, a construction corps, an embarkation service and other agencies, and to greatly increase the port and transport facilities of the quartermaster corps army transport service.

On the staff of Gen. Pershing was the assistant chief of staff, G-4, who co-ordinated the work of the supply departments at the general headquarters. These supply departments were: the quartermaster corps, the engineer corps, the signal corps, the motor transport corps, the transportation corps, the ordnance department, the air service, the medical corps, the chemical warfare service. In Feb. 1918, the line of communications was reorganized under the name of the services of supply with its single co-ordinating head, the commanding general, services of supply, with a general staff paralleling, in so far as necessary, the staff of Gen. Pershing. The principal functions of the services of supply were the procurement, storage and transportation of supplies, as well as the great construction projects necessary for the large force overseas. Even the control and transportation of replacements of men, as well as animals, were placed under the jurisdiction of the services of supply, which had control of the nine base ports. Similarly, an intermediate section, and an advance section close to the army zone, were organized. Within the advance section were organized advance depots and railway regulating stations.

The broad questions of policy of supply were handled by the assistant chief of staff, G-4, at the general headquarters and to supplement and co-ordinate American needs with those of the Allies in Europe there was formed, first in Aug. 1917, the general purchasing board, composed of representatives from every supply department in the A.E.F. In the summer of 1918 the general purchasing agent became a member of the interallied board of military supply.

There was the closest co-operation between the services of supply abroad and the War Department in the United States. When policies had been determined by the general headquarters, the commanding general, services of supply, was then authorized to communicate directly by cable and otherwise with the War Department in the United States, and such other agencies as were located in Europe, including the interallied board of military supply and our several representatives in neutral countries. The demobilization of the man-power and of industry was accomplished in short order, the former by a very carefully prepared and progressive plan without any strain upon the water or rail transportation or the demobilization camps available, while the latter was accomplished by co-operative reductions of plants, personnel and output by industry itself and a curtailment, adjustment or cancellation of contracts by the War Department.

The return of the army to a peace-time organization received early consideration by the general headquarters of the A.E.F. and the War Department and the National Defence Act of June 4, 1920, was placed upon the statute books. In the main the National Defence Act endeavours to put into effect the valuable elements of organization which obtained in the former peace-time army and war-time organization of the War Department and of the A.E.F. The several principal components of the U.S. army are given the same peace- and war-time organizations and the problems of supply and transport are thus standardized.

The War Department general staff organization is quite comparable to that which existed in the A.E.F. There is an assistant chief of staff, G-4, who co-ordinates the activities of the supply departments and makes studies of and recommendations for broad policies of supply and transport under the assistant secretary of war who is charged by the National Defence Act with the "supervision of the procurement of all military supplies and other business of the War Department pertaining thereto, and the assurance of adequate provision for the mobilization of *matériel* and industrial organizations essential to war-time needs."

The several supply branches and departments are: the quartermaster corps, the ordnance department, the air corps, the medical corps, the chemical warfare service, the signal corps and the engineer corps. At the headquarters of each of the several corps areas, territorial departments and tactical divisions there are assistant chiefs of staff (G-4) to co-ordinate the supply and transport policies and problems coming under the commands concerned. Each supply branch or department has its representative at each of the headquarters above mentioned.

An improvement in the procurement of supplies has been

effected through the creation of the General Supply Committee of the Treasury Department, by the Act of June 17, 1910, which, in effect, budgets by means of this committee the requirements in supply of miscellaneous items of any two or more departments of the Government and in this way standardizes prices, quality and items, and makes contingent budgeted contracts subject to the current fiscal year calls for filling by the several departments of the Government Another improvement is the creation of the Bureau of the Budget for budgeting of the financial estimates of the entire Government.

For the purposes of war-time plans and procurement the country has been divided, according to industrial density, into certain districts by the several supply departments and in order to meet local peace-time needs of troop supply with minimum transportation, convenient depots have been established This system of districts and depots affords the necessary framework for war-time expansion with due regard to the requirements of existing industrial allocations In the return of the army to a peace basis, in accordance with the organization prescribed by the National Defence Act, it will be noted that certain of the war-time branches or services have been abolished as distinct and separate services Among these may be mentioned the construction corps, the embarkation service and the motor transport corps, all of which have been absorbed by the quartermaster corps The war-time air service has become the present air corps and the war-time chemical warfare service has become the permanent peace-time service of that name All problems and matters of transportation and the supply of the means and methods of transportation are handled by the quartermaster corps (transportation branch) which has control of water, animal (wheel, saddle and pack), motor and land transport except the small railways used by the engineer corps in certain construction projects The matter of air transport is handled by the air corps For proper maintenance and replacement of animal transportation the quartermaster corps maintains a remount service with certain breeding establishments and depots. The veterinary corps is a separate section of the medical department and is under the control of the surgeon general of the army

SUPRA-RENAL EXTRACT. In medicine, the sterilized glycerin extract of the supra-renal gland of the sheep, the dose being 5 to 15 minims The active principle adrenaline or epinephrine occurs only in the medulla of the gland It forms minute white crystals, soluble in weak solutions of hydrochloric acid and is most frequently used in 1% solutions of the chloride

Adrenaline has no action on the unbroken skin, but applied to mucous membranes it causes blanching by stimulating the muscular fibres of the arterioles It acts rapidly in a similar manner when hypodermically injected The vessels of the uterus are strongly acted upon by it, but the effect on the cerebral vessels is slight, and the pulmonary vessels are unaffected The heart is slowed and the systole increased Adrenaline stimulates the salivary glands, produces a temporary glycosuria, and in poisonous doses causes haemorrhages into the viscera and oedema of the lungs

In Addison's disease the use of supra-renal extract has been beneficial in some cases, but its chief use is in the control of haemorrhage. For this purpose it is given in conjunction with local anaesthetics such as cocaine in order to produce bloodless operations on the eye, nose and elsewhere It is also useful in haemorrhage from small vessels, where it can be applied at the bleeding spot, as in epistaxis In surgical shock and in chloroform syncope an injection of adrenaline often saves life through the rise of blood pressure produced. An attack of bronchial asthma may be cut short by a hypodermic injection of adrenaline solution It should never be used in the treatment of haemoptysis Similar commercial products on the market are hemisine, renaglandine, suprarenine, adnephrine, paranephrine and renostyptine. Supra-renal snuff containing the dry extract with menthol and boric acid is of use in hay fever. Rhinodyne is of this type. Suppositories containing supra-renal extract are employed successfully to check bleeding piles

The chemistry of adrenaline has been mainly elucidated by the investigations of Pauly, Jowett and Bertrand; Jowett proposing a constitution (*see* annexed formula) now accepted as correct. Many substances having related constitutions have been synthesized, and resemble adrenaline in increasing the blood pressure. For example, the corresponding ketone, adrenalone (obtained in 1904 by Stolz) is active, and the methyl group can be replaced by hydrogen or another radical without destroying the activity. It seems that the para-hydroxyl group is essential For instance, para-hydroxyphenylethylamine, $HO\,C_6H_4CH_2\,CH_2NH_2$, which is one of the active bases of ergot, closely resembles adrenaline (G. Barger, *Journ. Chem. Soc.*, 1909, 95, pp. 1123, 1720; K. W Rosenmund, *Ber*, 1909, 42, p 4778), as does also its dimethyl derivative hordenine, an alkaloid found in barley (G Barger, *ibid*, p. 2193) Adrenaline is optically active, the naturally occurring isomer being the laevo form, like nicotine, the laevo base has a much greater physiological activity than the dextro (*See* ADRENALINE, ANIMAL EXTRACTS)

Adrenaline.

SUPREME COUNCIL. This term was evolved to denote the organ of supreme control at the Peace Conference at Paris in 1919 It was thought by some that this device was a new one, and the phrase "Diplomacy by Conference" was coined to express it But, in fact, a similar procedure was followed at Vienna during 1814–15 and subsequent years, with strikingly analogous results.

The Peace Conference started by excluding all but the Great Powers from anything but formal deliberations The original supreme organ was known as "The Council of Ten" and consisted of the heads of the delegations of the Great Powers and of their respective foreign secretaries This body was found too unwieldy, and it was considered that its numbers caused leakage and undue publicity To meet this difficulty President Wilson proposed, and Mr Lloyd George supported, the experiment of a Council of Four ("The Big Four"), who were the above-named, together with M Clemenceau (France) and Sig. Orlando (Italy). The Japanese occasionally sent a representative when their interests were involved, thus making a fifth member By this device business was transacted rapidly, informally and secretly After the departure of President Wilson and Mr Lloyd George on June 28, 1919, the Council of Four was superseded by a Council of Five which included Japan The leading diplomat of each Great Power attended on behalf of his country This arrangement ended in Jan. 1920, and the United States then withdrew her representative altogether The Supreme Council (as it was now called) did not, however, die at once, though it ceased to sit at Paris *en permanence*. Part of its functions were transferred to the Ambassadors' Conference (*q v*) and part to the League of Nations (*q v*).

Nevertheless attempts were repeatedly made to establish a system of "periodic reunions" between the premiers or leading men representing each Great Power. There were nine such meetings in 1920, six in 1921 and two in 1922. At the Conference of London (Feb. 21–March 14, 1921) it became quite clear to the Great Powers that Germany had, in the military sense, become incapable of resisting them It was also doubtful whether any forcible measures could actually produce substantial sums by way of reparation. On this point, grave divergences appeared between England and France. The supreme test came at the Conference of Paris (Aug 8–13, 1921). At that meeting there was a complete division between the French and British views over the assignment of territory in Silesia respectively to Germany and to Poland as a result of plebiscite. Finding agreement impossible

Mr. Lloyd George appealed to the League of Nations to settle the Silesian boundary, and M. Briand agreed to accept the award of the League on behalf of France.

Mr. Lloyd George's appeal showed quite clearly that the Supreme Council was no longer a body able to settle disputes between its members, in spite of the informal and unofficial character of its proceedings and of the close personal intimacy between its members. None the less, two further meetings took place. That at Cannes (Jan. 6–13, 1922) failed because M. Briand was overthrown by the majority in the French parliament, while the Council was actually sitting (Jan. 12). A desperate effort by Mr. Lloyd George to retrieve the situation by summoning a new Council at Genoa (April 10–May 19, 1922) failed because of French hostility to the proceedings. The failure of the Supreme Council would appear to have been inherent in the circumstances of its origin and constitution.

Like the similar organism created by Lord Castlereagh in 1814, it was evolved to meet a certain need, and decayed when that need ceased to be imperative. It was necessary at Vienna in 1814 and at Paris in 1919 to devise some method by which the work of the Peace Conference could be rapidly thrown into shape and decided without too many plenipotentiaries encumbering the discussion and too much outside pressure embarrassing the decision. The fact is that "Diplomacy by Conference" appears to be a method, a system or a means for oiling the wheels and for easing pressure. But it cannot, of itself, remove pressure or create harmony and cannot at present be accepted as a permanent system for conducting the affairs of the world.

SUPREME COURT OF JUDICATURE, in England, a court established by the Judicature Act 1873, consisting of the "Court of Appeal" and the "High Court of Justice." *See* COURT; JUDICATURE ACTS.

SUPREME COURT OF THE UNITED STATES, THE. The Supreme Court of the United States is the highest judicial tribunal of that Government. A new Government in Federal form was established by the Constitution of the United States. That instrument confined the authority of the central Government to those powers specifically or impliedly delegated; and all other powers were reserved to the respective States or to the people. Thenceforth there have co-existed two separate Governments, each exercising for different purposes sovereignty over the same territory. This division of sovereign power required a tribunal with authority to adjudicate controversies in the light of the Constitution. It was foreseen that the exercise of power under the respective Governments would give rise to disputes which must be settled to preserve internal peace. To settle such controversies the Supreme Court was established.

This tribunal was created and its jurisdiction defined by sections 1 and 2 of Article III. of the Constitution, which reads:

> The judicial power of the United States shall be vested in one Supreme Court, and in such inferior Courts as the Congress may from time to time ordain and establish. The Judges, both of the supreme and inferior Courts, shall hold their Offices during good Behaviour, and shall, at stated Times, receive for their Services, a Compensation, which shall not be diminished during their Continuance in Office.
>
> The judicial Power shall extend to all Cases, in Law and Equity, arising under this Constitution, the Laws of the United States, and Treaties made, or which shall be made, under their Authority;—to all Cases affecting Ambassadors, other public Ministers and Consuls;—to all Cases of admiralty and maritime Jurisdiction;—to Controversies to which the United States shall be a Party;—to Controversies between two or more States;—between a State and Citizens of another State;—between citizens of different States;—between citizens of the same State claiming Lands under Grants of different States, and between a State, or the Citizens thereof, and foreign States, Citizens or Subjects.
>
> In all Cases affecting Ambassadors, other public Ministers and Consuls, and those in which a State shall be Party, the Supreme Court shall have original Jurisdiction. In all the other Cases before mentioned, the Supreme Court shall have appellate Jurisdiction, both as to Law and Fact, with such Exceptions, and under such Regulations as the Congress shall make.

At an early day, however, the States insisted that their sovereignty be respected by denying the authority of the Supreme Court to hear any suit between a State and any individual, except possibly "Ambassadors, other public Ministers and Consuls," though it might still hear suits between different States. For this reason the original grant of jurisdiction to the Supreme Court was limited by the Eleventh Amendment, which became effective on February 7, 1795. This Amendment is as follows:

> The Judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States by Citizens of another State or by Citizens or subjects of any Foreign State.

The jurisdiction of the Supreme Court is both original and appellate. Its original jurisdiction is limited by the Constitution to "all Cases affecting Ambassadors, other public Ministers and Consuls;—and those in which a State shall be Party." In all other cases it "shall have appellate Jurisdiction, both as to Law and Fact, with such Exceptions, and under such Regulations as the Congress shall make." It is only its original jurisdiction that is safeguarded by the Constitution. Its appellate jurisdiction is determined by Congress, which sets up also the various Federal courts whose decisions shall be reviewed.

The first Judiciary Act was passed on September 24, 1789. This Act provided for a Supreme Court consisting of a Chief Justice and five Associate Justices; it enumerated the various inferior courts and fixed their jurisdiction; and provided for appellate jurisdiction from the State courts in certain cases presenting Federal questions. Subsequent Judiciary Acts steadily evidenced a tendency to decrease the obligatory jurisdiction of the Supreme Court. This is seen particularly in the Judiciary Act of 1925. This Act gives to the court a strictly limited jurisdiction and confines its judgments to Constitutional questions and matters that are of national importance.

The official title of the Chief Justice has varied in legislation as well as in the commissions issued to the different Justices. The first seven Chief Justices were commissioned under the title of "Chief Justice of the Supreme Court of the United States," but since that time the Chief Justices have been commissioned as "Chief Justice of the United States."

The judges of the Supreme Court, as well as all the Federal judges, are nominated by the President, confirmed by the Senate, and commissioned by the President. In the nomination of the judges, the President is left by the Constitution to his own discretion, as section 2 of Article II. of the Constitution provides that the President "shall nominate, and by and with the advice and consent of the Senate, shall appoint Ambassadors, other public Ministers and Consuls, Judges of the Supreme Court, and all other officers of the United States, whose Appointments are not herein otherwise provided for." The Constitution does not prescribe the qualifications for holding a judicial office. In the confirmation or rejection of the President's nominee, the Senate has sole discretion. Under the provisions of the Constitution in issuing the commission, however, the President exercises simply a ministerial power.

The term of the judges is during good behaviour, so that the term is for life unless a judge shall resign or by conviction on impeachment be expelled from office, as provided in section 4, Article II., of the Constitution. Only one Justice of the Supreme Court has been impeached—Samuel Chase, who was acquitted in 1805.

The Court consists (1929) of a Chief Justice and eight Associate Justices. From its number of five in the original Judiciary Act of 1789, it had been increased to six in 1807, to eight in 1837, and to nine in 1863. An Act of 1866 would have reduced the Associate Justices to six, but before sufficient vacancies had occurred thus to reduce the Court, the Act of 1869 was passed, which reconstituted the Court with a Chief Justice and

eight Associate Justices, as it remains at present

While the existence of the Court has generally been regarded as necessary in the Federal form of Government, yet no institution under the Constitution has been subject to more bitter opposition Its powers, its jurisdictions, and its decisions have been under constant challenge by one political party or another.

In spite of all manner of attack, the Court has held the confidence and respect of the people. Its decisions have influenced the growth and development of the nation It has had to deal with problems which were in a large sense political and which involved the true relation between the States and the central Government As long as this form of Government endures, these political, social and economic problems will recur and will continue to impose upon the Supreme Court the ultimate decision of the conflict between local and national interests

SUQ-ASH-SHUYUKH, a town in Mesopotamia in 31° N. and 46° 30′ E. The town lies on the lower Euphrates in a region which has probably always been of considerable fertility There is communication with Basra by river and also by land routes, the railway lying a few miles to the southwest The population is estimated at 12,000, most of whom are Arabs The town is noted for the manufacture of the "aba," the woollen cloak worn by the Mesopotamian Arab There is also a good deal of local metal work and a boat building industry The town is 63 miles above Qurna by river but the channel has now ceased to carry much water and is almost unnavigable, except at highwater.

SURABAYA (Dutch *Soerabaja*), the chief port and naval station in Java, D E Indies; pop (1927), 249 674, including 24.593 Europeans One of the most important centres of trade and commerce in the Far East, Surabaya is situated in the east of Java, on Surabaya strait, which divides Java from Madura, thus securing the shelter of that island for its roadstead, whilst its position on the Kali Mas, one of the mouths of the Brantas river, affords facility for transportation to the heart of the city From the entrance to Surabaya the lofty ranges of the Tengger and Arjuna mountains are seen with Semeru, the highest active volcano in Java, in the far distance A look-out station, Wilhelmina Tower, flanked by a small park is situated at the river's mouth and from here railway, steam tramway and road run inland, in a southerly direction, past the old Ft Prins Hendrik, to, first the old town, then the upper town, and beyond that to the suburbs of Gubeng and Wonokromo, where a new residential and well-planned Surabaya is fast arising It has electric trams and light, taxi-cabs, telephone system, cable communication with Batavia, Semarang, and Balik Papan, in Borneo, and an air service to Batavia.

Surabaya's interests are wholly naval and commercial. The naval station on the south side of the canalized Kali Mas, with the commercial docks opposite, consists of an outer and inner naval basin, with torpedo boat harbour, dock-yards and cholera barracks. The commercial port consists of breakwaters on the west side of the Kali Mas enclosing a harbour basin. Alongside the west pier of the basin is a wharf, 920 metres (Genoa Quay), and the Holland pier, 1,650 metres long The eastern part of the basin is for lighters, and in the north-eastern corner there is a harbour for three floating docks of 14,000, 3,500 and 1.499 tons capacity, also, north of the Genoa Quay, a wharf for the tankers of the Standard Oil Company. On the west border of the basin a new shipping canal has been made, the Kali Perak, and the Kali Mas has been improved as much as possible by widening and the construction of stone walls along the banks. All quays and warehouses are connected by direct, wide roads and railways with industrial centres in the hinterland.

Exports from Surabaya in 1926 were 212,352,634, and imports 204,817,021 guilders. The bulk of the chief product of Java, sugar, is sold in Surabaya, with a few exceptions, all the sugar estates on the island being amalgamated in the Java Sugar Producers' Association at Surabaya, which is the central sales' agency for sugar. It is also an important market for coffee, tobacco, maize and tapioca, whilst the Java hides are sold there chiefly There is steamer communication with the chief ports of the world and with most of the ports of the archipelago; lying on the main route from Singapore and Batavia to Australia, Surabaya also benefits from this traffic. (E E L.)

SURABAYA, a residency in the east of Java, D.E Indies; area, excluding that portion it gained when this residency was divided between Surabaya and Semarang, 3,682 sq m. It is bounded west by Semarang, south by Madiun, Kediri and Pasuruan, north by the Java sea and east by the Straits of Madura. Surabaya is one of the flattest residencies in Java, well watered by the Solo and the Brantas, and possessing a soil admirably adapted for the cultivation of sugar, the chief product, whilst tobacco, cassava (tapioca), coffee, coca, are grown, and the usual native crops—rice, pulses, fruit and vegetables. Cattle are bred extensively, forests in the western and Rembang portion yield quantities of teak (there is a central lumber yard at Chepu), and in this part too are extensive oil-fields with a large refining installation of the Dordrecht Petroleum Company at Chepu The population, excluding Rembang, is 2,555,596, almost entirely Javanese The capital is Surabaya, pop 249,674 (*q.v.*). Other towns are Grissee, 25 m N of Surabaya (pop 24,382), a port of the old Dutch East India Company, and one of the first places of Dutch settlement in Java, where there is a trade in edible birds' nests; Mojokerto (pop 18,990), a sugar industry centre, and the site of the Majapahit empire, with a museum of relics; Jumbang (pop 14,068), a sugar centre; Lamongan and Sidoarjo. The main railway line from Batavia crosses the residency, there are lines from Semarang to Surabaya City and thence to Pasuruan along the coast, and there is also excellent sea communication from the port of Surabaya In 1618 the Dutch allied themselves with the Adipati of Surabaya, who favoured the Dutch against his overlord, the Sultan Ageng, and this helped to establish Dutch power in Surabaya (E E. L)

SURAJ-UD-DOWLAH (d 1757), ruler of Bengal The date of his birth is uncertain, but is generally placed between 1729 and 1736 His name was Mirza Mohammed, and he succeeded his grandfather Aliverdi Khan as nawab of Bengal on April 9, 1756 He was a cruel and profligate fanatic Being offended with the English for giving protection to a native official who had escaped with treasure from Dacca, he attacked and took Calcutta on June 20, 1756 He then permitted the massacre known in history as "The Black Hole of Calcutta" (*See* CALCUTTA: *History*, and INDIA. *History*) This atrocious act was soon avenged. Calcutta was retaken by Clive and Admiral Watson on Jan. 2, 1757, and on June 23, Suraj-ud-Dowlah, routed at Plassey, fled to Rajmahal, where he was captured He was put to death on July 4, 1757, at Murshidabad, by order of Miran, son of Mir Jafar, who had conspired against Suraj-ud-Dowlah

SURAKARTA, a residency of central Java, Dutch East Indies; area 6,239 sq. kilometres. It is extremely hilly, except along the valley of the Solo, the principal river, which, with its tributaries, the Kaduan, etc, is of great value to the residency for agricultural purposes, watering the rich volcanic soil brought down from the mountains which flank either side of the Solo valley from north to south, and making Surakarta one of the most fertile portions of Java. In the west the mountains are dominated by the Merbabu and Merapi groups, in the east by the Lawu group Surakarta is bounded on the N. by Semarang, on the W. by Kediri and Jokjakarta, on the E. by Madiun, and on the S., a very small portion of coast-line, less than ten miles long, by the Indian Ocean. Surakarta is the chief tobacco-growing centre in Java, producing, in 1926, 10,000,068 kilos, or a third more than the whole of the rest of Java and half as much as the whole of Sumatra. Coffee is also a very important crop, whilst sugar-cane is grown very extensively on the volcanic ground at the foot of the

Merapi mountain: the residency has also the usual native cultures —rice, pulses, cassava, fruits and vegetables. The population of Surakarta is 2,257,177 (5,045 Europeans and Eurasians), and is almost entirely Javanese.

The Susuhunan, or sultan of Surakarta resides in the capital, Surakarta, pop. 156,162 (2,851 Europeans and Eurasians), also known as Solo where, too, is the headquarters of the Dutch Resident. In the city, which has all modern conveniences such as electric light and power, a telephone system, motor-cars and, except in the oldest part of the town (where there is an old Dutch settlement, and Ft. Vastenburg, as well as the native quarter), fine, wide streets, well-planned and with magnificent shade trees at their side, with many modern shops and residential buildings. Surakarta has also a zoological garden, some very interesting houses of native nobles, and a large market, whilst in the streets of the purely native city the scenes of native life—strolling actors, with hideous masks, performing in the open air, members of the Court, wearing curious sugar loaf, stiff caps and the *kris,* accompanied by an umbrella bearer, hawkers selling their wares—is an absorbing sight. Surakarta is on the banks of the Solo, it is also on the main railway line from Batavia to Surabaya, which crosses the residency in the centre, from west to east, and it is the starting point of a line of railway to Semarang, via Gundih. A tram line runs from Surakarta to Boyolati, the starting-point for the ascent to the sanatorium of Selo, 4,500 ft., on Mt. Merapi.

The Dutch agreement of 1755 recognized two native rulers in Java, the sultan of Jokjakarta and the susuhunan of Surakarta. From about 1830 onwards the native princes of Java have ceased to be of any political importance.

See T. S. Raffles, *History of Java* (1817); M. L. van De Venter, *Daendels-Raffles* (London, 1894). (E. E. L.)

SURAT, a city and district of British India in the northern division of Bombay. The city is on the site where the English first established a factory on the mainland, and so planted the seed of the British empire in India. In 1514 the Portuguese traveller Barbosa described it as an important seaport, and during the reigns of Akbar, Jahangir and Shah Jahan it rose to be the chief commercial city of India. At the end of the 16th century the Portuguese were undisputed masters of the Surat seas. But in 1612 Captain Best, and after him Captain Downton, destroyed the Portuguese naval supremacy and made Surat the seat of a presidency under the English East India Company, while the Dutch also founded a factory. In 1664 Sir George Oxenden bravely defended the factory against Sivaji, but its prosperity received a fatal blow when Bombay was ceded to the Company (1668) and shortly afterwards made the capital of the Company's possessions and the chief seat of their trade. From that date also the city began to decline. At one time its population was estimated at 800,000, but by the middle of the 19th century the number had fallen to 80,000; in 1921 it had risen to 117,434. It is still of commercial importance.

The city is situated on the left bank of the river Tapti, 14 m. from its mouth, and has a station on the Bombay, Baroda and Central India railway, 167 m. north of Bombay. A moat and city wall indicates the dividing-line between the city, with its narrow streets and handsome houses, and the suburbs. The city is a centre of trade and manufacture. There are cotton mills, factories for ginning and pressing cotton, rice-cleaning mills and paper, ice and soap works. Fine cotton and silk goods are woven, and there are special manufactures of silk brocade, gold and silver wire, carpets, sandalwood and inlaid work.

The District of Surat has an area of 1,651 sq.m., and the population in 1921 was 674,351. The district has a coast-line of 80 m., consisting of a barren stretch; behind this is a rich, highly-cultivated plain, nearly 60 m. in breadth, at the mouth of the Tapti, but narrowing to only 15 m. in the southern part, and on the north-east are the wild hills and jungle of the Dangs. The principal crops are cotton, millets, rice and pulses. The chief centres of trade are Bulsar and Surat. The district is traversed by the main line of the Bombay, Baroda and Central India railway, with a branch along the Tapti valley to join the Great Indian Peninsula railway at Almaner.

The Surat Agency consists of three native states: Dharampur (*q.v.*), Bansda (*q.v.*) and Sachin, together with the tract known as the Dangs. Sachin has an area of 49 sq.m., and a pop. (1921) of 19,997. There are 14 dangs or states, under Bhil chiefs, with an area of 653 sq.m. and a pop. of 24,576.

SURBITON, an urban district in Surrey, England, 12 m. S. of Waterloo, London; on the S. railway. Pop. (1921) 19,547. It has a frontage upon the right bank of the Thames opposite to Hampton Court. The district is largely residential.

SURETY, in law, the party liable under a contract of guarantee (*q.v.*). In criminal practice sureties bound by recognizance (*q.v.*) are means of obtaining compliance with the order of a court of justice, to keep the peace or otherwise. (*See* Principal.)

SURFACE. There is no agreed definition of a surface. We may think of it as the boundary of a solid body, or as the division between two portions of space, or as the locus of an ∞^2 set of points, selected by some law from the ∞^3 points of space, and having a certain amount of continuity; in each case a plane is the simplest example; but none of these gives a precise or satisfactory definition. A very simple model illustrates the kind of difficulty that arises. If a surface partitions space, it must have two sides: but a long strip of paper, with the ends joined after one has received a half-twist, forms a surface with only one side.

At an ordinary point O of a surface, there exists a *tangent plane,* the unique limit of the plane OPQ, when the adjacent points $P,Q \rightarrow O$ by any paths lying on the surface, the angle POQ remaining finite. Any point where this limit does not exist is *singular.* The *normal* is the perpendicular to the tangent plane at its point of contact O.

A surface can also be regarded as the locus of a point satisfying a geometrical condition expressed by a single equation between its rectangular cartesian coordinates, say $f(xyz)=0$. From this point of view, the definition of a surface depends on what types of function are admissible for f, and the question of continuity arises in another form. The surface is *analytic* if f is an analytic function, and in particular is *algebraic* if f is a polynomial. We shall use f as the name of the surface whose equation is $f=0$.

We may also consider a surface as the locus of a curve varying according to some definite law. Thus a sphere is the locus of a meridian circle which rotates about the polar axis, or of a circle of latitude whose centre advances along the axis, while the radius first increases from zero and then decreases. Any surface can be thus regarded, for it is always the locus of its own sections by a fixed pencil of planes.

In particular, a *ruled surface* is the locus of a variable line, whose different positions are the *generators.* There are two chief kinds of ruled surface: (1) If adjacent generators do not intersect, we have a *skew* surface; the simplest example is a hyperboloid of revolution, locus of a line which rotates about an axis which it does not meet. The shortest distance between adjacent generators determines a point on each, whose locus is the *curve of striction* of the skew surface. (2) If adjacent generators intersect, the surface is *developable,* and the locus of the point of intersection is the *edge of regression,* which is a cuspidal curve on the surface. The generators are the tangent lines to this curve.

By the principle of duality, any surface is also the envelope of a continuous ∞^2 set of tangent planes, selected from the ∞^3 planes of space by some definite law. From this aspect, a point is the simplest example. Exceptionally, a developable surface has only ∞^1 tangent planes, each touching it along a generator, instead of at a point, viz., the intersection of the plane with its consecutive. If each tangent plane is rotated about its generator of contact through an infinitesimal angle till it coincides with the consecutive plane, the whole surface is flattened out or *developed* into one plane, without tearing or stretching. Part of the plane is covered twice by the deformed surface, and part is uncovered, the edge of regression furnishing the boundary.

Whether regarded as a locus or an envelope, a surface f has ∞^3 tangent lines, defined as the limit either of the join of two adjacent points or of the intersection of two adjacent tangent planes. To touch f imposes one condition on the ∞^4 lines of space, and f has in general ∞^2 *bitangents,* each touching it at two distinct

points, and ∞^2 *inflexional tangents*, each meeting f in three adjacent points.

Degree, Class, Rank.—The *degree* of an algebraic surface is that of its equation, *i.e.*, that of the polynomial f. It is the degree of a plane section, and is also the number of intersections, real, coincident or imaginary, of f with any line. These are particular cases of more general properties of the degree. Two surfaces of degrees n, n_1 intersect in a curve of degree nn_1, or in an aggregate of curves of this equivalent total degree, when curves of contact and common multiple curves are counted a proper number of times. Three surfaces of degrees n, n_1, n_2 have n,n_1,n_2 distinct points of intersection, or the equivalent of this when points of contact and common multiple points are properly counted.

The *class* of f is the degree of its equation regarded as an envelope, connecting the tangential coordinates of any one of its tangent planes. The properties of the class are dual to those of the degree; it is the class of the tangent cone drawn to f from a general point and the number of tangent planes through a general line.

The *rank* is an intermediate numerical characteristic, the number of tangent lines that can be drawn through a given point and in a given plane through that point; it is the class of the plane section, and the degree of the tangent cone.

If the polynomial f falls into rational factors $f \equiv f_1 \ f_2$, of degrees n_1, n_2 where $n_1+n_2=n$, then each factor by itself represents a distinct algebraic surface, and if a point lies on either, its co-ordinates satisfy the equation of f; regarded still as a single surface, f is *degenerate*, breaking up into the components f_1, f_2.

Polars.—The point P_λ dividing the segment PP_0 in the ratio λ, 1 has four homogeneous co-ordinates of the form $x\lambda = x + \gamma x_0$. The condition that P_λ lies on f is that λ satisfies

$$F \equiv \lambda^n f_0 + \lambda^{n-1}\Delta f_0 + \cdots + \frac{\lambda^r}{(n-r)!}\Delta^{n-r} f_0 + \cdots + \frac{1}{n!}\Delta^n f_0$$

$$\equiv \frac{\lambda^n}{n!}\Delta^n{}_0 f + \quad + \frac{\lambda^r}{r!}\Delta^r{}_0 f + \ \cdots + f = 0,$$

where f_0 is $f(x_0, y_0, z_0, w_0)$ and $\Delta \equiv x\dfrac{\partial}{\partial x_0} + \text{etc}$, $\Delta_0 \equiv x_0 \dfrac{\partial}{\partial x} + \text{etc.}$

The surface $\Delta^r{}_0 f$, for $r = 1, \cdots, n-1$, is the rth *polar surface* of P_0 with regard to f, the first polar passes through all the multiple points of f. In particular, $\Delta_0{}^{n-1}f$ or Δf_0 is its *polar plane*, and $\Delta^2 f_0$ its *polar quadric*. The locus of points whose polar quadrics are cones is the Hessian of f. Its equation of degree $4(n-2)$ expresses that the determinant of second derived functions of f vanishes.

If two roots of $F=0$ are infinite, then P_0 lies on f, and P on the tangent plane at P_0; the two conditions are $f_0=0, \Delta f_0 = 0$. The latter represents the tangent plane at P_0, which is the polar plane of its point of contact. If P_0 is a multiple point, the tangent plane does not exist, and all the first derived functions of f vanish there.

If two roots of $F=0$ are equal and finite, its discriminant vanishes. This equation of degree $n(n-1)^2$ in x, y, z, w is satisfied if PP_0 touches f at P_λ, in general it represents the tangent cone from P_0 to f. Hence the class of f cannot exceed $n(n-1)^2$. It is less than this if f has multiple curves; for the condition is satisfied if P_λ is a multiple point of f, and the cone vertex P_0 standing on a multiple curve separates itself from the tangent cone.

If two roots of $F=0$ are 0, then PP_0 touches f at P, and $f=0$, $\Delta_0 f=0$. The curve of contact of the tangent cone drawn from any point P_0 to f is the whole or part of the intersection of f with the first polar of P_0, any residual intersection consisting of the multiple curves of f. This curve of proper contact passes through all the isolated multiple points of f.

Indicatrix; Curvature.—In order to examine a surface in the neighbourhood of a particular point, we take this as origin O of rectangular cartesian coordinates, and arrange f in homogeneous functions of x, y, z, say, $f = u_0 + u_1 + \ldots + u_n$. If f consists of a single homogeneous function u_n it represents a cone vertex O of degree n. If f is general, the condition that O lies on the surface is $u_0 = 0$.

If P (x, y, z) is a general point of space near O, at a distance small of first order, then the perpendicular distances of P from all general planes through O, viz.: x, y, z and all general linear functions of them, are small of first order. If P lies on f, the linear function u_1, being equal to $-(u_2 + \ \ldots + u_n)$, is small of second order; $u_1 = 0$ is the equation of the tangent plane, which in the neighbourhood of O lies infinitely closer to f than any other plane. Whenever we can safely neglect small quantities of second and higher order, the surface can be replaced by its tangent plane.

If we neglect terms of third and higher orders only, f can be replaced by the quadric $u_1 + u_2$, or more generally by any of the family $q \equiv u_1 + u_2 + u_1 v_1$, where v_1 is a general linear function. These are the *osculating quadrics* of f at O, any one of which is a second approximation to the surface. The sections of f and q by any plane through O have the same curvature at O.

Let O be an ordinary point of f, with z as tangent plane, and therefore $x=y=0$ as normal. Then $f \equiv z + u_2 + \cdots + u_n$, and the simplest osculating quadric is $q \equiv z + v_2$, where v_2 is the result of putting $z=0$ in u_2.

A plane $z =$ a small constant ζ, parallel and close to the tangent plane, cuts f approximately in the conic $v_2 = -\zeta$, with centre on the normal, called the *indicatrix*.

If a plane through the normal meets the indicatrix in a diameter of length $2r$, the radius of curvature of the normal section is ρ, where $\dfrac{1}{\rho} = \dfrac{2\zeta}{r^2}$. An oblique plane meeting the tangent plane in the same line, and making a finite angle ϕ with the normal, cuts f in a section of radius of curvature $\rho\cos\phi$, the projection of ρ upon the plane (Meunier's theorem). This vanishes for the tangent plane, when the section is singular.

The major and minor axes of the indicatrix lie on the *principal* normal planes, making sections of maximum and minimum radii of curvature, say ρ_1, ρ_2. For a normal section inclined at an angle θ to the first principal section, $\dfrac{1}{\rho} = \dfrac{\cos^2\theta}{\rho_1} + \dfrac{\sin^2\theta}{\rho_2}$ (Euler's theorem).

According to the nature of the indicatrix, O is an *elliptic hyperbolic* or *parabolic point* of f. If it is elliptic, all the normal curvatures are of the same sign, and the surface bends away from the tangent plane on one side only. The part near O of the section by $z=\zeta$ is a small real closed curve for ζ of one sign, and imaginary for ζ of the opposite sign. The section by the tangent plane $z=0$ has no real part in the neighbourhood except O itself, which is a double point with imaginary tangents. The surface is *synclastic*.

At a hyperbolic point, the surface is *anticlastic*. The principal curvatures are of opposite signs, and f bends away from the tangent plane on opposite sides in these directions. Two normal sections have inflexions, the curvatures vanishing; their planes pass through the inflexional tangents at O, which are parallel to the asymptotes of the indicatrix, and touch the section of f by the tangent plane, which has two real branches through O along which f crosses the plane. All sections near O have real branches there. If there is a line lying on f, it is one of the inflexional tangents at each of its points. *Conjugate* tangent lines are those parallel to conjugate diameters of the indicatrix.

At a parabolic point, the inflexional tangents coincide; the section by the tangent plane has a cusp. These points lie on the Hessian.

The normal at O does not in general meet the normal at an adjacent point, unless this lies on a principal section, in which case the normals intersect at one of the two *centres of curvature* of f at O. These coincide if the indicatrix is a circle; then O is an *umbilic*, all normal sections have the same curvature and all adjacent normals meet the normal at O.

Quadrics.—A surface of degree 2 is a *quadric* q; in general its class and rank are each 2 also. The simplest example is the sphere (*q.v.*). Every plane section is a conic. Parallel sections are similar and similarly situated conics, whose centres lie on a line, a *diameter* of q. The diameters concur at the *centre* (which may lie at infinity), which bisects every chord of q through it.

There are three mutually perpendicular planes of symmetry, the ***principal planes,*** intersecting by pairs in the ***principal axes*** which meet q in its *vertices*.

Through each point P of q there pass two generators, real or imaginary, lying wholly on q; their plane is the tangent plane to q at P, cutting q in this pair of lines. The generators fall into two systems, any one generator meeting all those of the other system and none of its own. A quadric is determined by any three generators of one system, and may be defined as the locus of a line meeting three fixed skew lines. There are six directions (only two real) of planes of circular section; the points of contact of the tangent planes parallel to these are the ***umbilics***.

A quadric has three *focal conics* (two real), to each point S of which there corresponds a ***directrix*** l, such that the distance of any point of q from S is proportional to its distance from l measured parallel to one of the planes of circular section; S and l are focus and directrix of the section of q by the plane Sl, which is the normal plane at S to the focal conic. A focus can also be defined as a sphere of zero radius touching q twice, the directrix being the chord of contact.

A quadric is fixed when its three principal sections are given, *i.e.*, it is determined by its centre, trihedron of principal planes, and lengths of principal axes. It depends on nine parameters. If the centre is finite, there are three main types of quadric, according to the types of the principal sections: ***ellipsoid*** (three ellipses), ***hyperboloid of one sheet*** (one ellipse, two hyperbolas), ***hyperboloid*** of two sheets (two hyperbolas, one section imaginary). If the centre is at infinity, one principal section is wholly at infinity; the other two are parabolas, meeting in the one finite vertex, and q is an ***elliptic*** or ***hyperbolic paraboloid*** according as these parabolas lie on the same or opposite sides of the tangent plane at the vertex. If the principal axes vanish, q is a quadric cone; if also the centre is at infinity, it is a cylinder. Finally, a degenerate quadric is a pair of intersecting, parallel or coincident planes.

The hyperboloid of one sheet and hyperbolic paraboloid have real generators, and models can be constructed by threads or wires; they are everywhere anticlastic. The ellipsoid, hyperboloid of two sheets and elliptic paraboloid have imaginary generators, and are everywhere synclastic. Referred to its principal axes, an ellipsoid of semi-axes, a, b, c has the equation $\frac{x^2}{a^2}+\frac{y^2}{b^2}+\frac{z^2}{c^2}=1$. An elliptic paraboloid referred to its vertex as origin can have the equation $\frac{x^2}{a^2}+\frac{y^2}{b^2}=\frac{2z}{c}$; and the other types of quadric can be represented by equally simple equations.

Cubic Surfaces.—A general cubic surface f is of class 12, or lower if it is singular. It possesses 27 lines lying on it, of which each meets 10 others, arranged in 5 intersecting pairs. There are 45 triangles lying on f, whose planes are tritangent, touching it at the vertices. We can also select, in 36 ways, a *double-six* from the 27 lines, consisting of two sets of six lines, each line meeting five of the other set and none of its own. Any plane through a line l cuts f in a residual conic meeting l in two points, at which the plane touches f. For two such planes, the conic touches l, at a parabolic point of f, lying on the Hessian.

There can be as many as four double points on a cubic surface. If these lie at the vertices of the tetrahedron of reference, the equation can take the form $\frac{1}{x}+\frac{1}{y}+\frac{1}{z}+\frac{1}{w}=0$. Each of the six edges of the tetrahedron absorbs four of the 27 lines, and there is one triangle of distinct lines, each meeting two opposite edges of the tetrahedron. A cubic surface can have one double line; it is then skew, each plane through the double line meeting it in a residual generator. Two of these pass through each point of the double line, and their plane meets f in a fixed line of the surface, the simple directrix.

Singularities.—A *singular point* of a locus is one at which there is no definite, single tangent plane. If the origin O is singular, and as above $f\equiv u_0+u_2+\cdots+u_n$, the four conditions are those involved by $u_0=0$, $u_2\equiv0$. The simplest case is the *conic node*, an ordinary double point represented by $f\equiv u_2+u_3+\cdots+u_n$, where u_2 is a general quadratic function of x, y, z, giving the proper tangent cone.

Any line through O meets f in two points coinciding at O, a generator of u_2 meets it in three points, and the six *lines of closest contact* given by $u_2=u_3=0$ meet it in four. The section of f by a general plane through O has a double point with two quite distinct branches, the tangents being generators of u_2; that by a plane through a line of closest contact has an inflexion on one branch. The section by a plane touching the tangent cone has a cusp, the two branches merging into one cycle.

If a general line through O meets f in s points there, in the simplest case O is an ordinary s-fold point with a proper tangent cone u_s, where $f=u_s+u_{s+1}+\cdots+u_n$; this involves $\frac{1}{6}s(s+1)(s+2)$ conditions. Any plane through O, or any surface having O as an ordinary point, meets f in a curve having an s-fold point there. If O is s_1-fold on the second surface, the two tangent cones having no common sheet, the curve of intersection has ss_1 branches through O. If O is also s_2-fold on a third surface, the three have ss_1s_2 points of intersection absorbed at O.

If the tangent cone breaks up, the simplest case is the *binode*, a double point whose quadric tangent cone consists of two *biplanes*, intersecting in the *edge*. The section by a general plane through O has a double point as for a conic node, that by a plane through the edge has a cusp, and that by one of the biplanes has a triple point. Taking the biplanes as planes of reference, we have $u_2=xy$; then the equation says that either x or y is small of second order, or else both are small of orders between 1 and 2. A general point of f near O is close to a definite one of the two biplanes, and, in this sense, we can speak of two sheets of f, one touched by each biplane; they are not separate sheets, but become indistinguishable near the edge $x=y=0$. There are three lines of closest contact in each biplane; these are in general different from the edge, which meets f in three points only.

The conic node and binode are *ordinary* singularities; *i.e.*, the tangent cone, proper or degenerate, has no repeated sheet. At an *extraordinary* singularity, the tangent cone u_s not only breaks up, but has a repeated sheet, u_r say, so that $u_s\equiv u_r^2\ s-2v$. The simplest case is the *unode*, a double point with a repeated tangent plane, $f=u_1^2+u_3+\cdots+u_n$. The surface has two connected half-sheets, the general section having a cusp. There are three lines of closest contact; the section by a plane through one of these has a tacnode, that by the tangent plane has a triple point.

A general point O of a double curve is a binode of a special kind. The two sheets of f are quite distinct; every simple point of f near O belongs definitely to one sheet or the other, the points of the double curve belonging to both. There is no continuous passage at all from one sheet to the other near O; but on the double curve there lie a certain number of *pinch-points*, unodes of a special kind (which may be absorbed in higher singularities), at which the two tangent planes coincide, and the two sheets become connected.

A *tacnode* of the surface is a double point where the general plane section has a tacnode, which is the plane singularity equivalent to two adjacent double points. Thus O has an infinite set of double points of f adjacent to it, one in every direction in the tangent plane, which may be considered as an infinitesimal double curve adjacent to O. In a similar way, a tacnodal curve is equivalent to two adjacent ordinary double curves.

In general, a singular point, whether isolated or lying on a singular curve, is characterized, first, by its multiplicity, *i.e.*, the number of intersections of f with a general line through the point that are absorbed there; next, by the nature of the tangent cone and its sheets, and of the singularity of a general section; and further by the nature and arrangement of the higher singularities of special sections. By a series of suitable transformations, any singular point or curve of a surface can be analysed into an equivalent set of component singular points and curves of standard types, and any surface can be transformed into one having only elementary singularities, and in particular into one having no isolated singular points, but only ordinary multiple curves and

such points of higher singularity as necessarily lie on them; or alternatively into a surface having only a double curve and a number of triple points which are also triple for the double curve. The complete theory is complicated. Isolated singular points may give rise on transformation to singular curves; and a singular curve may give rise, from the transformation of its special points of higher singularity, to other singular curves, whose general points may be of more complicated nature (though not of higher multiplicity) than the general points of the original curve

Singular tangent planes are defined dually to the above Any surface of degree $\geqq 3$ must have singularities of one or other kind, or of both A surface f of degree n with no singular points is of class $n'=n(n-1)^2$; a surface of class n' with no singular planes is of degree $n=n'(n'-1)^2$. These two equations are incompatible unless $n=n'=2$, and f is a quadric

If f has no point singularities, it has in general two series of double and stationary tangent planes, and its reciprocal has a double and a cuspidal curve. The characteristic numbers of these modify the equations relating degree and class, and make them compatible If f has higher singularities, there exists a complicated set of relations between the numerical characteristics, the simplest are the Plucker equations for the general plane section and tangent cone

Curves on a Surface.—The interest of f depends partly on the simpler curves lying on it. There are always its plane sections, and its curves of total intersection with other surfaces; lower curves may arise as partial intersections, components of a total intersection that breaks up through acquiring additional singularities, the cutting surface either touching f or passing through one or more of its singularities All curves on a plane are its total intersections, with cones standing on the curves. On a quadric, the conic section by a tangent plane acquires a double point at the point of contact and breaks up into a pair of generators A cubic surface contains 27 pencils of conics, cut out by planes through the 27 lines, and many other systems of curves of degrees 3, 4, and 5, cut out by quadrics containing various sets of the lines.

Other important curves on f are defined by infinitesimal properties An *asymptotic curve* is one whose tangent at any point is one of the inflexional tangents, parallel to an asymptote of the indicatrix A *curve of curvature* is one whose tangent at any point is a principal tangent, parallel to an axis of the indicatrix Two curves of each of these kinds can be drawn through any general point of f A *geodesic* is a curve whose small arcs are each the shortest distance on the surface between their extremities. On a plane, these are lines, on a developable surface, curves which become lines when the surface is flattened out An infinite number of geodesics can be drawn through a general point of f, one starting in any direction

Families of Surfaces.—If an equation contains a parameter λ, it represents a singly infinite family of surfaces; the most important case is the linear family or *pencil*, when the coefficients are linear functions of λ and the equation has the form $f+\lambda\phi=0$. One and only one member of the family passes through each point of space The total intersection of any two of the family is the same, being that of f, ϕ More generally, if f, ϕ are any two algebraic surfaces, the equation of any other containing their total intersection can be expressed as $\alpha f+\beta\phi=0$, where α, β are polynomials (Noether's theorem) In the same way, $f+\lambda\phi+\mu\psi$ gives an ∞^2 linear family or *net* of surfaces, one and only one passes through any two given points; any three surfaces of the net have the same *base*, or set of common points and curves, as f, ϕ, ψ.

If f is of degree n, it has $N=\frac{1}{6}(n+1)(n+2)(n+3)-1$ independent ratios of coefficients; all such surfaces form a linear family of N degrees of freedom, and one can be made to pass through N points in general position, each of which presents one independent condition to f. Thus a quadric can be drawn through nine points, and these determine it if they are general However, seven points determine a net of quadrics, whose base consists of eight points, viz, the seven and another, associated with and determined by the seven, which offers no independent condition; but the passage of the quadric through it is a necessary consequence of its passage through the others. Thus nine points do not determine a quadric if any eight of them are an associated set of this nature.

To have a given point as a double point imposes four conditions on f; to contain a given line, $n+1$ conditions. The number of independent conditions presented to f by an assigned element of any sort is the *postulation* of that element The conditions for a combination of elements may force f to contain other fixed elements, or to break up If six out of nine points lie on a plane, the only quadric containing them all consists of this plane and the plane of the other three points

Two surfaces are *orthogonal* if at every common point the angle between them, i e, between their normals, is a right-angle If three surfaces are mutually orthogonal, their curves of intersection are curves of curvature on each surface. If three linear families are such that the three surfaces through any point are at right angles to each other, they form an *orthogonal system; f* can form part of such a system only if it satisfies a certain differential equation of third order In the same way, a cubic family, with three members through any point, can be an orthogonal system, e g, the confocal quadrics

$$\frac{x^2}{a^2+\lambda}+\frac{y^2}{b^2+\lambda}+\frac{z^2}{c^2+\lambda}=1.$$

Among the infinite number of surfaces having the same boundary, i e, a given closed curve through which each is to pass, the *minimal surface* is that whose area is least This is the form assumed by a soap film bounded by a wire in the form of the given contour. The same property must attach to any small portion of the surface, and leads to a differential equation of second order, the boundary conditions determining the arbitrary elements of the solution A minimal surface is anticlastic everywhere. If it were synclastic at a point P, a plane near the tangent plane at P on one side would cut it in a small plane closed curve, approximately the elliptic indicatrix, whose area would be less than that of the cap on which P lies, and the total area could be reduced without affecting the given boundary

Parametric Representation; Genus.—The coordinates of any point on f can be represented as functions of two parameters We may consider x, y as the parameters, and z given as an implicit function of these by the equation $f=0$ More often it is convenient to express each coordinate as an explicit function of two other parameters, says $x=\phi\ (u,v)$, $y=\psi\ (u,v)$, $z=\chi\ (u,v)$

In general, ϕ, ψ, χ are many-valued functions, if there are r sets of values of x, y, z for each set of u,v, and we take $u\ v.$ as coordinates of a point of a plane, then f is represented on this plane by an r, 1 point transformation The nature of the representation depends largely on the form of the expression for the element ds of length of arc traced on the surface, given by

$$ds^2 = dx^2+dy^2+dz^2 = Edu^2+2Fdu\,dv+Gdv^2, \text{ say,}$$

where E, F, G are certain functions of u, v Here $E^{\frac{1}{2}}\ du$, $G^{\frac{1}{2}}\ dv$ are the elements of length along the curves represented by $v=$ const, $v=$const, at the point whose parameters are u,v; while F depends also on the angle between these curves. If they are everywhere at right-angles, e g, if they are the curves of curvature, then $F=0$

Rational surfaces are those which can be represented on a plane by a 1, 1 point transformation Then the coordinates of any point on f are rational functions of two parameters, the coordinates of the corresponding point of the plane. Of the different plane representations of f, the lowest is that for which the curves in the plane corresponding to the plane sections of f are of lowest degree. Any two of these have n variable intersections, corresponding to the points of f on the common line of the two planes of section; the remaining intersections are fixed, at points of the plane fundamental for the representation An important family of curves on f are those corresponding to the lines of the plane. Any two of these have one and only one variable intersection, the remainder falling at points of f fundamental for the representation All quadrics and cubics are rational. Surfaces of higher degree are not, unless they have a sufficient number of singular points and curves.

There are several numerical characteristics of a surface that vanish if it is rational, and may be regarded as answering to the genus of a curve. The simplest is the *genus* as defined by Noether (*Flächengeschlecht*), the number of linearly independent *adjoint* surfaces of degree $n-4$, passing $s-1$ times through every ordinary s-fold curve of f, and s^{-2} times through every ordinary isolated s-fold point, with other conditions at extraordinary singularities. It is also the number of linearly independent double integrals of the form $\iint F(x,y,z)dxdy$, where F is a rational function, and x,y,z are connected by $f=0$. If f has no singularities, its genus is $\frac{1}{6}(n-1)(n-2)(n-3)$.

SURFACE TENSION. The title under which many surface phenomena—including Capillarity—are usually considered.

When the surface of water (or other liquid) in a tank is carefully examined it is found not to be perfectly level. The statement that water finds its own level is only approximate. The surface in fact becomes considerably curved near its edges where the liquid comes in contact with the wall of the tank.

If a vertical tube with a very narrow bore is placed with one end in the water, the liquid rises some distance above the level of the outer surface. The rise is greater the smaller the diameter of the bore. The rise of oil through a wick is a phenomenon of the same kind.

If a small quantity of mercury is poured on a horizontal plate it forms a drop. If the quantity is only a few cubic millimetres the drop is nearly spherical—a much larger quantity spreads out into a cake-shaped mass with a nearly flat top and with rounded edges.

A drop of oil placed on a clean water surface spreads almost instantaneously so as to form a very thin film. The thinness of the film can be judged from the colours that flash out (*see* INTERFERENCE) or from the size of the area covered by even a small drop.

The phenomena of soap bubbles and the formation of froth in solutions of soap are also familiar ones. In these cases, also, thin films are formed.

The propagation of ripples of very short wave-length follows a different law from the propagation of deep sea waves.

When camphor is scraped so that the fragments fall upon a clean surface of water, they rush about on the surface with very rapid and rapidly changing motion. A minute quantity of oil placed on the surface brings them almost instantaneously to rest.

These and many allied phenomena, can all be studied under one heading. They arise from the existence of surfaces separating one medium from another. The special forces which come into play are thence known as Surface forces. The rise in tubes of narrow bore—which are known as capillary tubes because the bore is as "fine as a hair"—is due to these forces. From the special way in which the effects arise in this case the action is called *capillary action.* This name, though often applied in other cases, is hardly applicable except to the case of narrow tubes; while the term *surface action* is applicable in all. The forces which are concerned in these phenomena are those which act between neighbouring parts of substances. These also produce the effects of cohesion. Newton in the third edition of his *Opticks* refers to them in the following passage:—"The parts of all homogeneal hard Bodies, which fully touch one another, stick together very strongly . . . I . . . infer from their Cohesion that their Particles attract one another by some force, which in immediate Contact is exceeding strong, at small distances performs the chymical Operations above mention'd, and reaches not far from the particles with any sensible Effect. . . . There are therefore Agents in Nature able to make the Particles of Bodies stick together by very strong Attractions. And it is the Business of experimental Philosophy to find them out."

These forces must be distinguished from those of gravity which also act between the particles of matter because these latter can act over very great distances. (The earth is controlled in its motion round the sun by gravitation.) Cohesion acts to any measurable extent only over minute distances. Sticks of chalk for drawing are made by highly compressing finely ground chalk and other materials. If a stick is broken and the two parts are brought into their original position as nearly as possible by hand they do not stick together because the neighbouring particles are still so far apart as to exert no sensible attraction. High pressure is needed for them to begin sensibly to attract each other. Before considering in detail how these attractions arise we give a historical summary of the development of the subject.

Historical.—(The following historical summary is taken from James Clerk Maxwell's classical article in the ninth edition of this Encyclopaedia, as modified by the 3rd Lord Rayleigh in the tenth edition.) According to J. C. Poggendorff (*Pogg. Ann.* ci. p. 551), Leonardo da Vinci must be considered as the discoverer of capillary phenomena, but the first accurate observations of the capillary action of tubes and glass plates were made by Francis Hawksbee (*Physico-Mechanical Experiments*, London, 1709, pp. 139–169; and *Phil. Trans.* 1711 and 1712), who ascribed the action to an attraction between the glass and the liquid. He observed that the effect was the same in thick tubes as in thin, and concluded that only those particles of the glass which are very near the surface have any influence on the phenomenon. Dr. James Jurin (*Phil. Trans.*, 1718, p. 739, and 1719, p. 1083) showed that the height at which the liquid is suspended depends on the section of the tube at the position of the meniscus, and is independent of the form of the lower part. Sir Isaac Newton devoted the 31st query in the last edition of his *Opticks* to molecular forces, and instanced several examples of the cohesion of liquids, such as the suspension of mercury in a barometer tube at more than double the height at which it usually stands. This arises from its adhesion to the tube, and the upper part of the mercury sustains a considerable tension, or negative pressure, without the separation of its parts. He considered the capillary phenomena to be of the same kind, but his explanation is not sufficiently explicit with respect to the nature and the limits of the action of the attractive force.

It is to be observed that, while these early speculators ascribe the phenomena to attraction, they do not distinctly assert that this attraction is sensible only at insensible distances, and that for all distances which we can directly measure the force is altogether insensible. The idea of such forces, however, had been distinctly formed by Newton, who gave the first example of the calculation of their effect in his theorem on the alteration of the path of a light-corpuscle when it enters or leaves a dense body.

Alexis Claude Clairault (*Théorie de la figure de la terre,* Paris, 1808, pp. 105, 128) appears to have been the first to show the necessity of taking account of the attraction between the parts of the fluid itself in order to explain the phenomena. He did not, however, recognize the fact that the distance at which the attraction is sensible is not only small but altogether insensible. J. A. von Segner (*Comment. Soc. Reg. Götting.* i. [1751] p. 301) introduced the very important idea of the surface-tension of liquids, which he ascribed to attractive forces, the sphere of whose action is so small "ut nullo adhuc sensu percipi potuerit."

In 1756 J. G. Leidenfrost (*De aquae communis nonnullis qualitatibus tractatus,* Duisburg) showed that a soap-bubble tends to contract, so that if the tube with which it was blown is left open the bubble will diminish in size and will expel through the tube the air which it contains.

In 1787 Gaspard Monge (*Mémoires de l'Acad. des Sciences,* 1787, p. 506) asserted that "by supposing the adherence of the particles of a fluid to have a sensible effect only at the surface itself and in the direction of the surface it would be easy to determine the curvature of the surfaces of fluids in the neighbourhood of the solid boundaries which contain them; that these surfaces would be *lintéariae* of which the tension, constant in all directions, would be everywhere equal to the adherence of two particles, and the phenomena of capillary tubes would then present nothing which could not be determined by analysis." He applied this principle of surface-tension to the explanation of the apparent

attractions and repulsions between bodies floating on a liquid

In 1802 John Leslie (*Phil Mag.*, 1802, vol. xiv. p. 193) gave the first correct explanation of the rise of a liquid in a tube by considering the effect of the attraction of the solid on the very thin stratum of the liquid in contact with it. He did not, like the earlier speculators, suppose this attraction to act in an upward direction so as to support the fluid directly. He showed that the attraction is everywhere normal to the surface of the solid The direct effect of the attraction is to increase the pressure of the stratum of the fluid in contact with the solid, so as to make it greater than the pressure within the fluid

In 1804 Thomas Young (Essay on the "Cohesion of Fluids," *Phil. Trans*, 1805, p. 65) founded the theory of capillary phenomena on the principle of surface tension. He also observed the constancy of the angle of contact of a liquid surface with a solid, and showed how from these two principles to deduce the phenomena of capillary action His essay contains the solution of a great number of cases, including most of those afterwards solved by Laplace, but his methods of demonstration, though always correct, and often extremely elegant, are sometimes rendered obscure by his scrupulous avoidance of mathematical symbols. Having applied the secondary principle of surface tension to the various particular cases of capillary action, Young proceeded to deduce this surface tension from ulterior principles. He supposed the particles to act on one another with two different kinds of forces, one of which, the attractive forces of cohesion, extends to particles at a greater distance than those to which the repulsive force is confined He further supposed that the attractive force is constant throughout the minute distance to which it extends, but that the repulsive force increases rapidly as the distance diminishes. He thus showed that at a curved part of the surface, a superficial particle would be urged towards the centre of curvature of the surface, and he gave reasons for concluding that this force is proportional to the sum of the curvatures of the surface in two normal planes at right angles to each other.

The subject was next taken up by Pierre Simon Laplace (*Mécanique céleste,* supplement to the tenth book, pub. in 1806). His results are in many respects identical with those of Young, but his methods of arriving at them are very different, being conducted entirely by mathematical calculations For those who wish to study the molecular constitution of bodies it is necessary to study the effect of forces which are sensible only at insensible distances, and Laplace has furnished us with an example of the method of this study which has never been surpassed He found for the pressure at a point in the interior of the fluid an expression of the form

$$p=K+\tfrac{1}{2}H(1/R+1/R'),$$

where K is a constant pressure, probably very large, which, however, does not influence capillary phenomena, and therefore cannot be determined from observation of such phenomena; H is another constant on which all capillary phenomena depend; and R and R′ are the radii of curvature of any two normal sections of the surface at right angles to each other.

The next great step in the treatment of the subject was made by C. F Gauss (*Principia generalia Theoriae Figurae Fluidorum in statu Aequilibrii,* Göttingen, 1830, or *Werke*, v. 29, Gottingen, 1867). The principle which he adopted is that of virtual velocities, a principle which under his hands was gradually transforming itself into what is now known as the principle of the conservation of energy. Instead of calculating the direction and magnitude of the resultant force on each particle arising from the action of neighbouring particles, he formed a single expression which is the aggregate of all the potentials arising from the mutual action between pairs of particles This expression has been called the force-function. With its sign reversed it is now called the potential energy of the system. It consists of three parts, the first depending on the action of gravity, the second on the mutual action between the particles of the fluid, and the third on the action between the particles of the fluid and the particles of a solid or fluid in contact with it.

The condition of equilibrium is that this expression (which we may for the sake of distinctness call the potential energy) shall be a minimum This condition when worked out gives not only the equation of the free surface in the form already established by Laplace, but the conditions of the angle of contact of this surface, with the surface of a solid.

In 1831 Siméon Denis Poisson published his *Nouvelle Théorie de l'action capillaire.* He maintained that there is a rapid variation of density near the surface of a liquid, and he gave very strong reasons, which have been only strengthened by subsequent discoveries, for believing that this is the case

The result, however, of Poisson's investigation is practically equivalent to that already obtained by Laplace In both theories the equation of the liquid surface is the same, involving a constant H, which can be determined only by experiment The only difference is in the manner in which this quantity H depends on the law of the molecular forces and the law of density near the surface of the fluid, and as these laws are unknown to us we cannot obtain any test to discriminate between the two theories

We have now described the principal forms of the theory of capillary action during its earlier development. In more recent times the method of Gauss has been modified so as to take account of the variation of density near the surface, and its language has been translated in terms of the modern doctrine of the conservation of energy. *See* Enrico Betti, *Teoria della Capillarità: Nuovo Cimento* (1867); a memoir by M Stahl, "Ueber einige Punckte in der Theorie der Capillarerscheinungen," *Pogg Ann* cxxxix. p. 239 (1870); and J D Van der Waals' *Over de Continuiteit van den Gasen Vloeistoftoestand* A good account of the subject from a mathematical point of view will be found in James Challis's "Report on the Theory of Capillary Attraction," *Brit. Assn. Report,* iv. p. 235 (1834).

J A F Plateau (*Statique expérimentale et théorique des liquides*, 1873), who made elaborate study of the phenomena of surface tension, adopted the following method of getting rid of the effects of gravity. He formed a mixture of alcohol and water of the same density as olive oil, and then introduced a quantity of oil into the mixture It assumes the form of a sphere under the action of surface tension alone. He then, by means of rings of iron-wire, discs and other contrivances, altered the form of certain parts of the surface of the oil. The free portions of the surface then assume new forms depending on the equilibrium of surface tension In this way he produced a great many of the forms of equilibrium of a liquid under the action of surface tension alone, and compared them with the results of mathematical investigation The debt which science owes to Plateau is not diminished by the fact that, while investigating these beautiful phenomena, he never himself saw them, having lost his sight in about 1840

G L van der Mensbrugghe (*Mém de l'Acad. Roy de Belgique,* xxxvii., 1873) devised a great number of beautiful illustrations of the phenomena of surface tension, and showed their connection with the experiments of Charles Tomlinson on the figures formed by oils dropped on the clean surface of water.

Athanase Dupré in his 5th, 6th and 7th Memoirs on the Mechanical Theory of Heat (*Ann. de Chimie et de Physique,* 1866–68) applied the principles of thermodynamics to capillary phenomena, and the experiments of his son Paul were exceedingly ingenious and well devised, tracing the influence of surface tension in a great number of very different circumstances, and deducing from independent methods the numerical value of the surface tension. The experimental evidence which Dupré obtained bearing on the molecular structure of liquids must be very valuable, even if our present opinions on this subject should turn out to require modification.

GENERAL THEORY OF CAPILLARY ACTION

It is found by experiment that the forces between molecules to which cohesion is due only act preceptibly across very short distances. If we regard the forces between two particles as acting according to a law depending only upon their positions it must vary inversely as the distance according to, a higher power than

that of the inverse square which is obeyed by gravitation. The experiments of Quincke and others show that the extreme range through which sensible effect is produced by them is certainly much less than a thousandth of a centimetre and it is probably less than one millionth.

In order to illustrate the important bearing of this limitation in range consider a molecule, A, well within a substance. A sphere

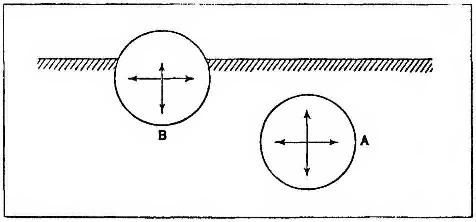

FIG. 1

of a thousandth of a centimetre radius may be drawn round it and the molecules outside this sphere will have no sensible influence on A. Those within the sphere attract A but in the case of a homogeneous isotropic body their pulls will be uniformly distributed and the resultant *force* on A will be zero. There will, however, be a pressure throughout the sphere due to the attraction: each spherical layer, being attracted, will compress the particles lying inside it. But if we consider a particle B very near the surface—nearer in fact than the range of action—the state of things will be found to be different. There will be more particles pulling B downwards than upwards so that all such particles as B will experience a resultant-*force* downwards. There will also be a *pressure* at B but its value is less the nearer B is to the surface. There is, therefore, a thin, indefinitely bounded, layer near the surface which is in a different condition from the main body of the substances. Many of the properties will be different in this surface layer from elsewhere. For example, corresponding to the different pressure, the density will be different. Since work is done in producing compression the potential energy will differ in the two regions. In the main body it can be written

$$\int \chi_0 \rho_0 dV = \chi_0 \rho_0 V_0$$

where V = volume, ρ density and χ the potential energy per unit mass; in the film, owing to its minute thickness, e, which we divide up into still thinner layers, de, and surface S we write

$$\text{Total mass} = V\rho_0 - S\int_0^e (\rho_0 - \rho)\, de$$

while the total potential energy (in terms of χ its value per unit mass) is

$$\int \chi\rho dV$$

or

$$V\chi_0\rho_0 - S\int_0^e (\chi_0\rho_0 - \chi\rho)\, de.$$

Multiplying the total mass by χ_0 and subtracting from the last expression

$$E - M\chi_0 = S\int_0^e (\chi - \chi_0)\rho de.$$

The right hand side is therefore an expression for that part of the energy which depends upon the existence of a surface S. The integral which multiplies it is the constant (or rather, factor) known as the *surface tension*. This integral is a measure of the work done in increasing the area of the surface. It must be carefully distinguished from the corresponding increase in the total energy because heat is drawn in simultaneously if the change takes place at constant temperature. It is in strictness a measure of the change in the "free-energy." (*See* THERMODYNAMICS: Applied to *Chemistry*.)

By the principles of energy the potential energy (at constant temperature) tends to a minimum; in other words, any change that takes place spontaneously involves a diminution of this energy. Hence, whenever the surface tension is positive there will be a tendency for the surface to decrease, and the diminution will in fact take place unless it is resisted by other forces. This diminution takes place not by a contraction of the liquid but by a passage of the surface molecules into the body of the liquid. The properties of the body are not changed thereby. In this respect the phenomenon is quite different from the case of a stretched india-rubber film. In the case of the liquid the surface tension remains constant during the contraction of the surface area; in the case of the stretched india-rubber it diminishes along with the contraction.

We may express it otherwise by saying that if an imaginary straight line be drawn anywhere in the surface, when *equilibrium exists* there must be a force acting across the line in such a direction as to prevent further contraction of area. It is easy to show that this force per unit length of line is numerically the same as the surface-tension as defined above.

Dupré has described an arrangement by which the surface-tension of a liquid film may be illustrated. A piece of sheet metal is cut out in the form AA' (fig. 2). A very fine slip of metal is laid on it in the position BB' and the whole is dipped into a solution of soap. When it is taken out the rectangle $AA'CC'$ is filled by a liquid film. This film tends to contract on itself and the loose strip of metal will, if let go, be drawn towards AA'. If S is the area *of one face of the film* the potential energy is σS. If $AA' = b$ and $AC = a$ it is equal to σab. Hence if F is the force by which the slip is pulled towards AA', $F = \frac{d}{db}(\sigma ab) = \sigma a$; so that the force per unit length for one face is σ. Hence, σ is either the force per unit length or the potential energy per unit area.

It must be added that we have only considered one of the two faces and the force due to it. There is an equal force on the strip due to the second surface so that the total force is twice as great as the value taken. But the total area is twice as great also so that the conclusion remains unchanged.

There are other ways of illustrating the existence of the tension. Form a film as before but in a fixed frame. Tie a short length of spider line or fine unspun silk so as to form a flexible ring. If it is placed carefully on the film it usually takes an irregular shape. If the film inside the ring is destroyed by piercing it with a hot wire the spider line opens out into a circular form, this being the form which makes the surrounding surface least for a given length of line. Again, a small drop of mercury or a falling rain drop is practically spherical—the sphere being the form which has the smallest area for a given volume. A large drop fails to be spherical because gravitational forces are then strong enough to compete successfully with surface forces. Sometimes a difficulty is felt in connection with the assertion that the surface-tension is constant. Take a film such as we considered and place it vertically. The upward force on $AA' = 2\sigma a$ for the two faces, the downward force at the level CC' is also $2\sigma a$. The remaining force on the portion of the film between these lines is its weight. Hence the resultant force on the mass of the film is its weight and its acceleration should therefore be that of a freely falling body. Yet whatever may be found true for a pure substance, it cannot be true in general that the tension is the same at all parts of a large area. In the case of a soap film some adjustment must automatically take place (either by alteration of concentration or otherwise) which makes the upper tension a little greater than the lower. It is probably the power of such an adjustment being made in the case of a soap solution which is the leading requisite permitting a *durable* film to be made. Otherwise the film would literally fall to pieces.

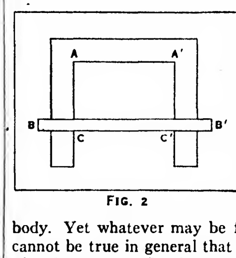

FIG. 2

Theory of Cohesion.—The mode in which cohesion is ex-

plained by assuming the existence of forces between elements (*i e.*, infinitesimal volumes) of matter can be illustrated by supposing the substance of a body to be distributed continuously instead of partitioned into molecules. Such was the mode in which Laplace, more than a century ago, regarded it, and indeed it is the assumption that has always been made until recent times regarding the distribution of the substance of a body

Let the force between two elementary volumes be supposed proportional to the product of the volumes and inversely as the nth power of their distances apart The force required is that across unit area drawn anywhere well inside the body arising from the volumes on each side of it The calculation is made in successive stages

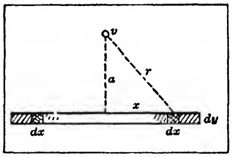

FIG 3

(i) Take a lamina of thickness dy. The force on an elementary volume v due to a zone of radius x and width dx is $v \cdot \frac{2\pi x\, dx}{r^n} \cdot \frac{a}{r} dy$ since the tangential components will cancel each other. Hence the whole lamina attracts the element with a force

$$2\pi va \int_a^\infty \frac{xdx}{r^{n+1}} \cdot dy = 2\pi va \int_a^\infty \frac{dr}{r^n} dy$$

This becomes $\frac{2\pi va}{(n-1)a^{n-1}}dy$ or $\frac{2\pi v}{(n-1)a^{n-2}}dy$ since we assume the forces to vanish at infinity.

(ii.) Let v be an element in a parallel lamina of thickness da. Then the total force per unit area on such a lamina II. is obtained by putting $v=da$. Hence we find the force on a semi-infinite solid above lamina II. due to lamina I. by integrating from 0 to ∞ that is

$$\text{Force on semi-solid (per unit area)} = \frac{2\pi dy}{n-1}\int_0^\infty \frac{da}{a^{n-2}}$$

$$= \frac{2\pi}{(n-1)(n-3)} \left| \frac{1}{a^{n-3}} \right|_0^\infty$$

(iii.) The force (per unit area) on such a semi-infinite body due to a semi-infinite body in contact with it is obtained by integrating with respect to y from $y=0$ to $y=\infty$. This force is the cohesion per unit area and is given by

$$K_0 = \frac{2\pi}{(n-1)(n-3)(n-4)} \left| \frac{1}{a^{n-4}} \right|_0^\infty$$

The unit of force used is that between two unit volumes separated by unit distance.

Lord Rayleigh remarks: "The pressure will therefore be infinite whatever n may be. If $n-4$ be negative the attraction of infinitely distant parts contributes to the result; while if $n-4$ be positive the parts in immediate contiguity act with infinite power. For the transition case, discussed by W Sutherland (*Phil Mag* xxiv p 113, 1887) of $n=4$, K is also infinite." He adds "It seems therefore that nothing satisfactory can be arrived at under this head."

In more recent times, however, it has been realized (particularly by the Dutch school of physicists) that to treat the body as a *continuum* is bound to give erroneous results Every substance is known to be built up of molecules. If we assume the existence of attractions depending on the distance between the centres of the molecules it is at the same time necessary to recognize that the two halves of the body can never approach to absolute contact. The lower limit in the last integration should be the least distance of separation between the lines of centres of contiguous layers This will be a magnitude comparable with the molecular diameter, say s. The value we seek then becomes

$$K_0 = \frac{2\pi}{(n-1)(n-3)(n-4)} \cdot \frac{1}{s^{n-4}}.$$

There is now no objection on the above grounds to the power law provided that $n>4$.

There can be no doubt that if the amount of matter compressed into unit volume (*i e.*, the density ρ) be increased the value of the intrinsic pressure would be increased. Moreover, a factor Γ (akin to the gravitation constant) is also needed if K is to be expressed in ordinary dynamical units Hence finally

$$K = \Gamma \cdot \frac{2\pi\rho^2}{(n-1)(n-3)(n-4)} \cdot \frac{1}{s^{n-4}}.$$

The quantity, K, is called the Laplace pressure or intrinsic pressure. More generally we could assume that the force between elementary volumes is $f(r)$. The successive integrals then become

i. $$2\pi a \int_a^\infty f(r) dr dy = 2\pi a \phi(a)\, dy;$$

ii. $$2\pi dy \int_y^\infty a\phi(a)\, da = 2\pi dy\, \psi(y);$$

iii. $$K_0 = 2\pi \int_s^\infty \psi(y)\, dy$$

where ϕa, ψy are written as the values of successive integrals Finally K is obtained in ordinary units by multiplying by $\Gamma\rho^2$ For example if $f(r) = \epsilon^{-kr}$ where k is a constant we have

$$\psi(s) = \frac{ks+1}{k^3} \epsilon^{-ks}$$

The difficulty in testing these formulae arises from the occurrence of three variables (k, s, Γ) The only one of these about which we know the value independently is s which for liquids must be of the same order as the molecular diameter. Caution is necessary in considering forces which vary so fast with the distance as cohesive forces undoubtedly do A small error in the assumed value for s would lead to very considerable error in k and Γ. The intrinsic pressure *at the breaking point* of a solid in tension should be the breaking stress itself. The latter as actually measured is, however, only a lower limit of K since flaws in the material and irregularities in the application of the tension will lead to fracture occurring at a value lower than the ideal stress. The effect of cohesion on the characteristic equation of a gas was allowed for by van der Waals who, following Laplace, took the intrinsic pressure as varying with the density square alone. The equation becomes

$$(p+a\rho^2)(v-b) = RT$$

where at the same time b is introduced to represent the fact that the volume of the gas cannot be reduced to zero. Here $K = a\rho^2$ which for water at ordinary densities is between 10–20 Atmos The fact that the equation turns out to be approximate only makes caution necessary. Moreover a is found to vary nearly inversely as the absolute temperature. We are obliged to assume, therefore, either that Γ is a function of the temperature or, what is more likely, that s is such a function The latter assumption is indeed a very plausible one, for the least average distance of approach of the molecules must be affected by the motion of agitation amongst them and this increases as the square root of the absolute temperature.

Besides these considerations it must be pointed out that the modification worked out by the Dutch school only partly allows for the effects arising from the molecular character of matter. Knowing the forces between two molecules at a given distance apart, the actual value of the intrinsic pressure could only be correctly obtained by summing up the components (normal to the interface at which the pressure is being calculated) of all the forces between every pair of molecules each being calculated for the actual positions in which the molecules instantaneously are. It is true, that with forces that vary so fast with distance it is only the molecules which are fairly near to a point whose individual contributions are important: the contributions of the remainder may be estimated by an approximate method such as that followed by Laplace. Something has been done in this direction (Lennard-Jones, *Faraday Society*, "Discussion on co-

hesion," 1927) but the fact remains that though the law of force is probably greater than the inverse fifth it may vary up to the inverse seventh so far as present knowledge goes. If we take the higher of these two estimates the force between molecules which are neighbours and those that are next door to neighbours will be as 2^7 to 1, *i.e.*, in the ratio 128 to 1 or that between any layer and the next and next but one contiguous layer as 2^6 to 1, *i.e.*, in the ratio of 64 to 1. Hence all but a small percentage of the intrinsic pressure is due to the molecules in a small volume surrounding the point. This conclusion is important since it signifies that in any material (gas, liquid, solid) the intrinsic pressure will be uniform at all points except for a thin layer of usually negligible volume near its boundary.

Theory of Surface Forces.—This surface layer has theoretically no inner boundary but it may be taken, for most purposes, as being only a few molecules thick (mol. diameter is of the order of 10^{-8} cm.). The most prominent peculiarity is that it possesses more potential energy than the rest of the body per unit volume.

Now increase of free energy at constant temperature is equal to the external work done on a system. If we write $dW=\sigma dA$ σ is called the surface tension. To determine its value theoretically we estimate dW for the formation of a surface of unit area. Now if a body is split by a plane section and the two halves separated, a fresh surface is formed. The attraction per unit area between the halves at any distance x is

$$2\pi\int_x^\infty \psi(y)dy = K(x) \text{ say.}$$

The total work of separation is $\int_0^\infty K(x)\,dx$ and in the process a fresh area of 2 units is formed. Hence expressing the work done in ordinary units

$$2\sigma = 2\pi\Gamma\rho^2\int_0^\infty K(x)dx$$

(In previous editions many theorems were given [some of which date from Laplace] which depend, however, upon the lower limit being zero. It is sufficient to say that these theorems are not applicable to the formulae given here.)

If a power law is taken as the law of force between molecules it follows that

$$\sigma = \frac{\pi\rho^2\Gamma}{(n-1)\,(n-3)\,(n-4)\,(n-5)\,s^{n-5}}.$$

This law may be combined with that for K with the result that

$$\frac{K}{\sigma} = \frac{2\,(n-5)}{s}.$$

For water at ordinary temperature, approximately

$$K=10{,}000 \text{ Atm.}=10^{10} \text{ dynes/sq.cm.}$$
$$\sigma=75 \text{ dynes/cm.}$$
$$s=4\times10^{-8} \text{ cm.}$$

Whence, $\quad n-5=\dfrac{10^{10}\times4\times10^{-8}}{2\times75}=\dfrac{8}{3}$

and $\quad n=7{\cdot}67.$

It must not be forgotten, however, that K and s are obtained by very approximate methods only.

Interfacial Tensions.—When two liquids are in contact there is in general a surface-tension at the interface which is called interfacial tension. Denoting this by σ_{12} and the tensions of the liquids as σ_1 and σ_2 respectively, and carrying out a separation of the two liquids the value of σ_{12} can be determined. In the above process the interface between 1 and 2 disappears and two fresh surfaces appear at which the tensions are σ_1 and σ_2. Hence

$$\sigma_2+\sigma_1-\sigma_{12}=2\pi\rho_1\rho_2\int_{\frac{s_1+s_2}{2}}^\infty K(x)dx$$

where the lower limit is the sum of the radii of the two kinds of molecules. Hence

$$\sigma_{12}=\pi\rho_2^2F(s_2)+\pi\rho_1^2F(s_1)-2\pi\rho_1\rho_2F\left(\frac{s_1+s_2}{2}\right).$$

Young took the functions F as being identical being all the same function of zero instead of the molecular diameters;

whence $\quad \sigma_{12}=\pi(\rho_2-\rho_1)^2\,F(0)$

or $\quad \sqrt{\sigma_{12}}=\text{const.}\times(\rho_2-\rho_1).$

Hence for three liquids taken pair by pair

$$\sqrt{\sigma_{12}}+\sqrt{\sigma_{23}}+\sqrt{\sigma_{31}}=0.$$

These simplified relations are known not to be true. On the other hand if the power law is valid and is the same law for different substances the equations given here lead to

$$\sigma_{12} = \left(\frac{\rho_2^2}{\sigma_2^{n-5}}+\frac{\rho_1^2}{\sigma_1^{n-5}}-\frac{2\rho_1\rho_2}{\left(\frac{s_1+s_2}{2}\right)^{n-5}}\right)\frac{\pi}{(n-1)(n-3)(n-4)\,(n-5)}$$

and the square root law should not be expected to be true excepting in special cases in which the molecular diameters of the three substances were the same.

All surface-tensions with which we have to deal are in reality interfacial tensions since a liquid is always in contact with its own vapour or the gas in which it is immersed. The effect due to the gas is known, however, to be very small.

The normal pressure to be expected from the existence of a superficial tension is best obtained by considering in the first place a cylinder.

Consider an element of surface, $ds\times$unity. The tensions acting at its extreme edges are inclined to one another and have a resultant inwards. Their resultant is a normal force $2\sigma\sin\dfrac{d\theta}{2}$ or in the limit $\sigma d\theta$. But $\dfrac{ds}{d\theta}=R$ (the radius of curvature); hence the normal force is $\sigma\dfrac{ds}{R}\cdot$ Since this acts over an area equal to ds, the normal pressure is σ/R.

If we take a body of any shape and select a square-bounded element of the surface, the tensions in the plane of the diagram are equivalent to a normal force $\sigma ds_1\times\dfrac{ds_2}{R_1}$ and those acting on the other two edges to $\sigma ds_2\times\dfrac{ds_1}{R_2}\cdot$ Hence per unit area

$$p=\sigma\left(\frac{1}{R_1}+\frac{1}{R_2}\right)\cdot$$

Here R_1 and R_2 are the radii of curvature in two planes at right angles. Owing to Gauss's theorem of integral curvature the sum of two such curvatures at a point is a constant. The above theorem is therefore true whether the two rectangular planes considered are principal planes or otherwise. In the case of a sphere

$$p=\frac{2\sigma}{R}\cdot$$

Effect of Temperature.—The variation of surface tension with temperature was not taken into account in Laplace's theory. The forces between molecules were taken, like gravitational forces, to be independent of temperature. The rise in a capillary tube was supposed to vary merely because the density varied. Experiment has shown, however, that the tension itself in all cases diminishes with rise in temperature. That it must ultimately diminish to zero can be inferred from the fact that according to the usual conceptions as to the critical state a liquid and its vapour will at that point become identical with one another; the tension at the interface must then be zero. Eotvös introduced the conception of molecular surface tension. By means of somewhat doubtful reasoning he concluded that $\sigma(Mv)^{2/3}$ (where Mv is the molecular volume), plotted against temperature should give

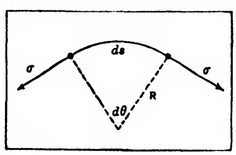

FIG. 4

the same kind of curve for different substances, and he found in fact that it was representable by $K(T_c-T)$ where T_c is the critical temperature and K a constant. According to Ramsay and Shields K should be the same constant for all non-associated substances In reality K varies betyeen 1·5 and 2 6 and it is necessary also to change T_c-T to $T_c-T-\delta$ where δ is a small constant, so that the law is only a rough one. According to this equation the curve would be a straight line cutting the temperature axis a few degrees below the critical point

In connection with this, it is important to remember that σ is only the free energy per unit area and not the total energy per unit area (u). Lord Kelvin was the first to prove that the variation of σ with temperature, involves that u must be greater than σ; or in other words, when an expansion of the surface takes place heat must be added to keep the temperature constant. The connection between these quantities he proved thermodynamically to be $u=\sigma-T\dfrac{d\sigma}{dT}$ (*vide* THERMODYNAMICS applied to chemistry) Now, at the critical point, u (which is only the *extra* energy due to the existence of unit surface and not the total energy of the whole body) must also vanish But if both u and σ are then zero so also must $T\dfrac{d\sigma}{dT}$ be zero

Hence, if our conceptions of the critical state are correct the curve of σ plotted against T instead of being a straight line must become horizontal at the critical point. In 1894, van der Waals showed that a formula of the type $\sigma=A(T_c-T)^n$ was to be expected and gave the average value of $n=1{\cdot}27$ as deducible from the experimental values In 1916 A. Ferguson (*Phil Mag*, Jan. 1916), examining the data for 14 different organic substances showed that the best values of n ranged from 1·187 to 1·248. The advantageous character of this power equation is that it makes σ, u, and $\dfrac{d\sigma}{dT}$ all equal to zero at the critical point and it thus satisfies all that is required of it theoretically. Liquids, however, which are believed to be associated do not follow the above simple law.

The surface energy, u, also falls to zero at the critical point, but according to a different law For taking the equation

$$u=\sigma-T\frac{d\sigma}{dT}$$

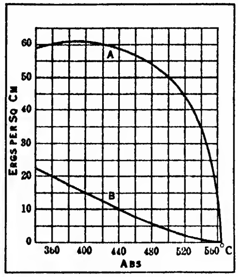
it follows that $u=A(T_c-T)^{n-1}(T_c+[n-1]T)$ The curves for σ and u are shown in fig 5 for the case of benzene The curve shows how nearly a straight line law satisfies the values of σ until the critical point is closely approached An interesting relation has been given by Prof. E T. Whittaker between u and the latent heat (internal) of *evaporation*. The internal latent heat (L_i) is obtained by subtracting the external work done from the ordinary latent heat. The relation in question is that $\dfrac{T_c}{T}\cdot\dfrac{u}{L_i}$ is nearly a constant, and that (in C.G.S. units) this constant is about unity for ethyl oxide, methyl formate, benzene and chlorobenzene and about 2 for carbon tetrachloride. The degree of constancy is indicated in the following table for benzene (Crit temp = 561 5A)

$T°A$	$\dfrac{T_c u}{TL_i}$	$T°A$	$\dfrac{T_c u}{TL_i}$
353	1·106	493	1·089
403	1·100	503	1·106
453	1·067	513	1·129

The relation is important since it indicates the close connection there is between the surface energy and the volume energy of the substances.

General Properties of Surface Tension.—The notion of surface tension, though it is only a derived one, enables us to deal with all the phenomena which were enumerated at the head of this article without making explicit reference to the more fundamental notion of molecular attractions upon which they in reality depend. It is appropriate to summarize here the leading characteristics of this property.

The tension of a liquid across any straight line drawn on the surface is normal to that line and is the same for all directions of the line and is measured by the force across an element of the line divided by the length of that element.



BY COURTESY OF THE FARADAY SOCIETY

FIG 5

For any given homogeneous liquid surface, as the surface which separates water from air or oil from water, the surface tension is the same at every point of the surface and in every direction. In the case of mixtures, however, when circumstances demand it (*e g*, when the surface is inclined and the effects of a gravitation field require consideration) the concentration at the surface may adjust itself from point to point of the surface in such a way as to produce a corresponding variation in the value of the surface tension sufficient to satisfy the conditions of equilibrium This effect is very minute and in nearly every problem may be ignored.

When the surface is curved the effect of the surface tension is to make the pressure on the concave side greater than that on the convex side by the amount $\sigma(C_1+C_2)$ where C_1 and C_2 are the curvatures in mutually perpendicular normal planes

The tension of the surface separating two liquids cannot be deduced by any reliable method from the tensions of the liquids when separately in contact with air The experiments of C G. M Marangoni, van der Mensbrugghe, and Quincke have led to results which show that the common surface between two liquids has a tension always less than the difference of the tensions of the separate liquids This is usually referred to as Marangoni's rule

If three liquids meet along a line the interfaces at the common edge must be parallel to the sides of a triangle proportional to the three tensions σ_{12}, σ_{23}, σ_{31} otherwise equilibrium cannot obtain (Neumann's rule) This triangle cannot exist unless two of the interfacial tensions are greater than the third. Marangoni's experimental rule shows that the triangle is always imaginary. Hence three pure fluids (of which one may be a gas) accordingly cannot remain in contact. If a drop of oil stands in a lenticular form upon a surface of water, it is because the water-surface is already contaminated with a greasy film.

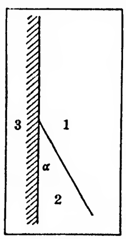


FIG 6

When a solid body is in contact with two fluids the surface of the solid cannot alter its form but the angle at which the surface of contact of the two fluids meets the surface of the solid must depend on the values of the three surface tensions. For equilibrium

$$\sigma_{31}-\sigma_{32}=\sigma_{21}\cos\alpha.$$

The angle α is known as the angle of contact For pure substances the angle is definite. It varies from zero (or very nearly so) for liquids that "wet" the solid to 130° or 140° for mercury on glass

In regard to the experimental behaviour of water on mercury the wealth of papers is equalled by the remarkable lack of uniformity in the results obtained even when elaborate precautions are taken. A drop of water which fails to spread when placed on a mercury surface is often caused to spread by the action of pouring the mercury out of the dish—thus involving the creation of a new surface! Water shows a positive tendency to spread *in vacuo* on a drop *formed in vacuo!* (Burdon, *Faraday Society*, May, 1927).

Form of a Capillary Surface.—The form of the surface of a liquid acted on by gravity is easily determined if we assume that near the part considered the line of contact of the surface of the liquid with that of the solid bounding it is straight and horizontal.

This will be the case, for example, near a flat plate dipped into the liquid. Let A_2P_2 be the vertical plate supposed to be so wide that the edge effects do not count. We will consider the forces per unit depth (perpendicular to the paper) and will consider A_1A_2 as the standard level of the liquid far from the plate. The curvature of the surface at the point x, y, is

$$\frac{d\theta}{ds} = \sin\theta\frac{d\theta}{dy} = -\frac{d(\cos\theta)}{dy}$$

and consequently the pressure in the liquid at that point is less than the pressure outside it by $-\sigma\frac{d(\cos\theta)}{dy}$. But the pressure is less than that at a distant point where the surface is flat by $g\rho y$ or $g(\rho-\rho_0)y$ if allowance is made for the surrounding gas. Hence the differential equation for the surface is

$$-\frac{d(\cos\theta)}{dy} = \frac{g(\rho-\rho_0)}{\sigma}y$$

the integral of which is $1-\cos\theta = 2\sin^2\frac{\theta}{2} = \frac{g(\rho-\rho_0)}{\sigma}\cdot\frac{y^2}{2}$.

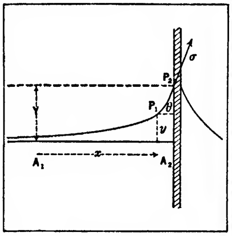

FIG. 7

The shape of the surface is therefore the *elastica, i.e.*, the form taken by a uniform spring when equal and opposite forces are applied at its ends (*see* Thomson and Tait, *Natural Philosophy*, vol. i. p. 455). The equation might have been found by considering the elementary volume of a strip of liquid, dx, sustained above the normal level of the liquid by the surface forces at its outer and inner edges. The difference of the vertical component of these is $\sigma d(\sin\theta)$ and the weight of the strip is $g\rho y dx$ but since $\frac{d(\sin\theta)}{dx} = -\frac{d(\cos\theta)}{dy}$ the same result is obtained.

If the angle of contact is α the value of θ at the plate is $\frac{\pi}{2}-\alpha$; hence

$$1-\sin\alpha = \frac{g(\rho-\rho_0)}{\sigma}\cdot\frac{Y^2}{2}$$

which gives the greatest height through which the liquid is raised. A thin sheet of glass suspended from the arm of a balance and just dipping into a liquid provides a simple way of determining the surface tension. The increase in the apparent weight of the sheet when the liquid has been raised by capillarity is σ multiplied by twice the horizontal length of the sheet. A sensitive form of this apparatus is known as Worthington's multiplier in which the strip is rolled into a vertical cylindrical spiral.

FIG. 8

Ascent up a Capillary Tube.—A capillary tube dipped in a liquid provides a simple method of determining surface tension. To connect the surface tension with the rise (or descent) of the liquid in the tube measured from the level part of the outside surface we equate the effective weight of the liquid raised to the total force due to the tension. The effective weight (with the symbols shown on diagram) is

$$g(\rho-\rho_0)\int_0^x 2\pi x(h+y)dx$$

for an inner cylinder of radius x where ρ is the density of the liquid and ρ_0 that of the surrounding gas or vapour. The vertical component of the surface force acting all round the edge of the liquid surface of this cylinder is $2\pi x\sigma\sin\theta$ or $2\pi x\sigma\cos\alpha$ where θ is the angle between the surface and the horizontal and α is the "contact-angle" which is measured with respect to the solid surface (in this case the vertical). These two expressions are to be equated to one another.

If we can neglect y altogether compared with h and integrate between the limits 0 and r we obtain $2\pi r\sigma\sin\theta = g(\rho-\rho_0)\pi r^2 h$ whence $\sigma\sin\theta = \frac{1}{2}g(\rho-\rho_0)rh$. To seek for a better approximation we first differentiate the two sides of the equation whence

$$\frac{d(x\sin\theta)}{dx} = \frac{g(\rho-\rho_0)}{\sigma}x(h+y) = \frac{x(h+y)}{\beta^2}.$$

We may consider this as the standard exact equation. The left side is

$$\frac{x\,d\sin\theta}{dx} + \sin\theta \quad \text{or} \quad x\left(\frac{\cos\theta d\theta}{dx} + \frac{\sin\theta}{x}\right).$$

But $\cos\theta\frac{d\theta}{dx} = \frac{d\theta}{ds}$ (where ds is an element of the curve AC) and is $\therefore$ the curvature in the plane of the diagram at B; and $\frac{\sin\theta}{x}$ is the curvature of the surface at B in a plane at right angles to the diagram. Hence, calling these curvatures $\frac{1}{R_1}$ and $\frac{1}{R_2}$ we have

$$\sigma\left(\frac{1}{R_1}+\frac{1}{R_2}\right) = g(\rho-\rho_0)(h+y);$$

both of the terms here are expressions for the difference of pressure between the two sides of the surface at the point B.

Narrow Tubes.—The equation shows that the sum of these curvatures increases with the height; but when h is big and y small, as it is for a very narrow tube, the sum is nearly constant. Going back to the differential form of the equation and taking the case where the liquid wets the tube, we may consider the curve as practically circular, of radius r; the corresponding value of $y = r-\sqrt{r^2-x^2}$ and

$$\frac{d(x\sin\theta)}{dx} = \frac{1}{\beta^2}(h+y)x = \frac{x}{\beta^2}(h+r-\sqrt{r^2-x^2}) \text{ nearly whence, by}$$

integration

$$x\sin\theta = \frac{1}{\beta^2}\left[\frac{hx^2}{2}+\frac{rx^2}{2}+\frac{1}{3}\{(r^2-x^2)^{\frac{3}{2}}-r^3\}\right].$$

or since $\sin\theta = 1$ when $x = r$

$$1 = \frac{r}{2\beta^2}\left(h+\frac{r}{3}\right).$$

By putting the radius of the circle as $R = \frac{r}{\cos\alpha}$ when the angle of contact is α instead of zero this becomes

$$\cos\alpha = \frac{r}{2\beta^2}\left[h+\frac{r}{3\cos^3\alpha}\{1-3\sin^2\alpha-2\sin^3\alpha\}\right].$$

By calculating $\tan\theta$ from $\sin\theta$ and bearing in mind that

$$\tan\theta = dy/dx,$$

we can by subsequent integration obtain a closer value of y in terms of x which can, in turn, be introduced into the differential equation and so on. By such successive approximations Lord Rayleigh has obtained the equation for the case $\alpha = 0$ in the form

$$\sigma = \tfrac{1}{2}g(\rho-\rho_0)hr\left[1+\frac{1}{3}\frac{r}{h}-0{\cdot}1288\frac{r^2}{h^2}+0{\cdot}1312\frac{r^3}{h^3}\right]$$

in which the coefficients are claimed to be correct to the approximation given. The equation can only be used in the case when r is small compared with h. It may be mentioned that a very near approach to the equation can be obtained by considering the surface as ellipsoidal with its minor axis vertical. This was first shown by Hagen and Desains. Various methods are employed for determining surface tension experimentally:

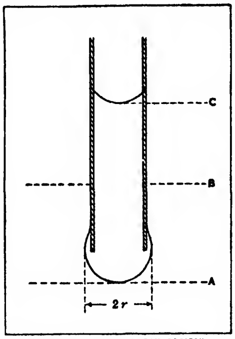
(*a*) From the rise in a capillary tube making use of the above equation.

(*b*) *Sentis's Method.*—A capillary tube is partly immersed in the liquid. It is then withdrawn vertically and a drop remains

clinging to the lower end; the position A of the vertex of the drop is noticed The liquid in the vessel is then raised until it touches the vertex (when the column falls) and then raised further till the upper surface is at the same level C as at first. The liquid in the vessel is then at the level B. The vertical distance AB corresponds to h in the ordinary method but in the *correcting terms h* must be put negative The width of the *drop* is in this case to be small compared with h.

(*c*) *Jaeger's Method*—In this method an orifice (a "tip") is placed just under the surface of the liquid and the pressure of gas is increased until bubbles form. The *maximum* pressure of the gas (which is fairly sharply marked) is observed The deduction of the applicable equation is a somewhat delicate matter because the problem is really a kinetic, not a static, one. The formula employed is

$$\sigma = \frac{p_{\max} r}{2}\left[1 - \frac{2}{3}\frac{r}{h}\right]$$



BY COURTESY OF THE FARADAY SOCIETY

FIG 9

where $p_{\max}$ is the maximum difference of pressure between the level of the end of tube inside and outside, and r is the internal radius of the tube. The bubble is assumed to form within the internal circumference. In practice, however, it sometimes forms on the outside circumference To obviate the uncertainty it is recommended to make the two circumferences as nearly equal as possible, but this is an experimental matter of great difficulty. The final accuracy depends chiefly on the measurement of the radius r. The subject of the formation of bubbles and drops requires much more study than it has received

(*d*) *Drop Weight Method.*—This method is connected with the preceding one because the drops considered are those issuing from a narrow tube. It was employed by Tate (1864) who gave as the result of his observations.—Other things being the same, the weight of a drop of liquid is proportional to the diameter of the tube in which it is formed Later, Quincke used it and gave the value $2\pi r\sigma$ as the weight of the suspended drop just before falling provided that the inflow of liquid is sufficiently slow. A portion of the drop is always left behind when the main part falls; but he considered that it might be neglected in the case of very small drops.

Rayleigh has discussed the question from the "dimensional" point of view. (*See* UNITS AND DIMENSIONS) Assume that the mass M of the drop depends only upon the surface tension, σ, the value of acceleration due to gravity, g, the density of the liquid, ρ, and the inside radius, a, of the tube Rayleigh shows that $\sigma a/g$ has the same dimensions as a *mass* and that $\sigma/g\rho a^2$ is a pure number. Since quantities that can be equated together must be quantities of the same kind, it follows that $M \propto (\sigma a/g)F(\sigma/g\rho a^2)$ where there is no restriction, imposed by this method of inquiry, upon the function F of the quantity in the second pair of brackets. Rayleigh finds by experiment that $gm/\sigma a$ is fairly constant for wide ranges in the diameter of the tube For thin-walled tubes in the case of water the following values were obtained

$\frac{\sigma}{g\rho a^2}$	$\frac{gM}{\sigma a}$	$\frac{\sigma}{g\rho a^2}$	$\frac{gM}{\sigma a}$
2·58	4·13	·277	3·78
1·16	3·97	·220	3·90
·708	3·80	·169	4·06
·441	3·73		

The mean value of the constant is thus about 3·8 instead of 2π which the imperfect theory gave. Further experiments by Harkins and Brown show that the constant approaches Quincke's value as the diameter becomes very small

As a means for measuring surface tension this method is obviously not satisfactory; but for rough comparative values for liquids of like kind it is a very quick and easy method.

Wide Tubes.—When a is not small the approximations made above for narrow tubes are not suitable.

The question has been fully discussed by the late Lord Rayleigh to whose papers reference should be made (*v.* Rayleigh, *Proc Roy. Soc* A, 92, 184, 1915).

Bubbles and Drops.—These can be dealt with by similar methods Air bubbles in a liquid can be formed of any size, from minute ones which are nearly spherical to large ones shaped like a flat cake. The excess pressure $p-p_0$, which is easily found by experiment, determines the total curvature at the lowest point N; being equal to $\frac{2}{R}$. If y is reckoned upwards as before, then

$$\frac{d(x\sin\theta)}{dx} = \left(\frac{2}{R} + \frac{y}{\beta^2}\right)x\,;$$

thus $\frac{2}{R}$ replaces h/β^2 in the previous problems. For very large bubbles, as for wide tubes, a good approximation can be obtained by neglecting the second curvature and also $\frac{2}{R}$, so that

$$(1-\cos\theta) = \frac{y^2}{2\beta^2} = 2\sin^2\frac{\theta}{2}.$$

If H is the value of y for which the tangent to the curve becomes vertical we have $H=\sqrt{2}\cdot\beta$. This method has been used by Quincke and others but not always with bubbles large enough to justify the approximation that is made. The bubble is conveniently formed under a slightly concave surface so as to prevent it from escaping Drops of mercury are easily formed above a concave surface. If y is measured *downwards* from the summit the same formulae hold as for bubbles

Great attention has been paid to these methods owing to their use in determining surface-tension The most thorough treatment from the practical point of view is given by Bashforth and Adams (*Capillary Action*, 1883). By means of infinite series calculated for each of the variables each term in the differential equation can be calculated to very high accuracy and tables are drawn up enabling the form to be determined for given weights of material and given surface tensions

Thin Films.—In this section we consider thin films The first group of cases consists of those in which the substance forms a thin sheet with gas on both sides, as for example, a soap bubble Here we have always two surfaces to consider. When the thickness is considerably greater than the value of the range, ϵ of molecular forces the two surfaces are independent of one another, the surface-tension must then have the usual value for each For very thin films this will not be so. If the thickness is less than the range, ϵ, the tension for each surface will be certainly less than the normal value When the variation of density at different levels in the film is taken into account it is clear that the reduction in the surface-tension must begin when the thickness is twice ϵ.

FIG 10

A soap film is simply a small quantity of soapsuds spread out so as to present a large surface to the air The soap solution may with great advantage be specially prepared. The addition of glycerine and resin enables more permanent films to be prepared. Bubbles may easily be blown 20 in in diameter in the open air using a clay pipe or a small glass funnel. (The method needs no precise description) Sir James Dewar has obtained bubbles that last almost indefinitely if evaporation be prevented by blowing them in a confined space saturated with water vapour.

The pressure inside a bubble is greater than that outside by

$2\sigma\left(\frac{1}{R}+\frac{1}{R}\right)$, *i.e.*, by $4\sigma/R$ where R is the radius of curvature. The factor 2 arises because both surfaces give rise to normal components of forces. This result is easily obtained by considering the equilibrium of each *half* of the bubble. The force at the cut edge is $2\sigma \cdot 2\pi R$ and this is balanced by the excess pressure acting over the plane area πR^2. Hence the excess pressure is

$$\frac{2\sigma \cdot 2\pi R}{\pi R^2}=\frac{4\sigma}{R}.$$

If the end of the pipe or funnel is opened the bubble will contract because of the escape of high pressure air from inside. As it contracts the pressure rather paradoxically increases. It may be added that (neglecting gravity) the bubble is spherical because this *shape* makes the surface area (and therefore the potential energy) least for a given volume.

If bubbles are blown on the expanded ends of two funnels (the stems being stopped by the fingers) they can be made to coalesce by carefully bringing them into contact. (A slightly electrified rod brought not too near will assist the coalescence.) On drawing the funnels slowly apart a cylindrical bubble is obtained. The excess pressure is now $2\sigma/R$ where R is the radius of the opening of the funnel. Further separation causes the cylinder to contract in the middle; one of the two curvatures is now negative; the surface is an *anticlastic* one. With further extension of length the surface becomes unstable and the film collapses. It has been shown by Clerk Maxwell that a cylindrical film becomes unstable when its length is greater than its circumference.

Films on Liquids.—In the second group of cases a liquid or solid is on one side and a gas on the other. To this group belong all cases of the spreading of oil or other substance on water or other liquid or solid. This old familiar subject has recently acquired very great importance in its bearing upon molecular structures. The first to experiment in detail on such films was F. H. R. Lüdtge (*Pogg. Ann.* cxxxix., p. 620), who showed how a film of high surface tension is replaced by one of lower surface tension. Akin to these are experiments made on the erratic movements that are observed when fragments of camphor are sprinkled on a *clean* water surface. A trace of grease such as may be communicated to the surface by dipping a finger in the water may be sufficient practically to stop this motion. The thickness of oil which is required may be spoken of as the "camphor-point." The first to determine it was (the 3rd) Lord Rayleigh who in 1890 (*Roy. Soc. Proc.*) showed that the thickness of the film of olive oil, calculated as if continuous (*i.e.*, non-molecular) which corresponds to the camphor-point is about 2×10^{-6} mm.; *i.e.*, it is only a moderate multiple of the supposed diameter of a gaseous molecule and perhaps scarcely exceeds at all the diameter to be attributed to a molecule of oil; and he ultimately realized that this phenomenon was therefore entirely outside the scope of a theory of surface action such as Laplace's in which matter is regarded as continuous and that an explanation required a direct consideration of molecules.

In 1891 Miss Pockels (*Nature*, XLIII., 437 [1891]) showed by means of a movable slider on water (the surface tension being measured by means of the attraction on a small disc) that the contaminating material on the surface could be squeezed up and concluded from her experiments that the water-surface can exist in two sharply-contrasted conditions; the normal condition, in which the displacement of the partition makes no impression on (the value of) the tension; and the anomalous condition in which every increase or decrease (of the surface) alters the tension.

The question was taken up again by Lord Rayleigh in 1899 (*Phil. Mag.* XLVIII., 1899) with apparatus designed on the lines of that of Miss Pockels (but employing a different way of measuring the surface tension) and he concluded that the first drop in tension corresponded to a complete layer one molecule thick and that the diameter of a molecule of oil is about $1{\cdot}0\times10^{-6}$ mm.

Later investigations have been made by I. Langmuir (in America: *J. Amer. Chem. Soc.*, 1915 to 1918) and N. K. Adam (in England) and their coworkers. By measuring the surface area that can be completely covered by a weighed quantity of material Langmuir determined both the cross-sectional area and the length of a molecule and proved that the length for organic molecules like those of palmitic, stearic, cerotic acids, etc., was nearly five times the breadth, while in cetyl palmitate it is nearly ten times. Adam has developed the technique and has very much extended the theoretical interpretation (*Roy. Soc.*

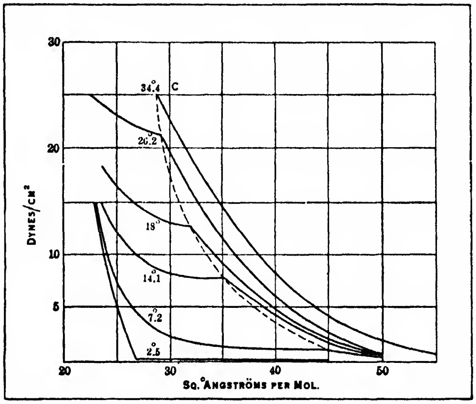

FIG. 11

Proc. A. 1921 to present time). Both Langmuir and he measured the amount of "oil" and measured directly the force required to compress the surface to any given area by means of a floating barrier. The actual force measured is the length of the barrier multiplied into the difference of the surface tension on the two sides of it. On the outside the surface is that of pure water—on the inside that of water on which a thin film has been formed. It is found that when the molecules in the film are so sparse as to be widely separated from one another the force due to the film is an expansive one.

This cannot be explained on Laplace's theory: it is necessary to modify it by allowing for the effects of thermal motion; the film in such a case is analogous to a two-dimensional gas. If the barrier is now moved so as gradually to compress the film various changes take place successively which are depicted in fig. 11 for the case of a film of myristic acid on weak HCl (N/100). The unit of area adopted is a square each side of which is an Ångström unit (*i.e.*, 10^{-10} metre), and the area specified is that occupied by one molecule of the acid. The ordinates of the curves are the difference of the tensions on the two sides of the barrier. The curves are isothermals extending from 2·5° to 34·4° C. They exhibit some of the characteristics of the p, v, curves for a condensible substance. At high temperatures the curves appear to be approximately rectangular hyperbolas. For small values of the area they approach the form for liquids. At intermediate stages, however, there is no constant pressure isothermal as in the analogous case of the vapour pressure of a liquid below the critical point (the form is more nearly that for the vapour pressure of a *mixture of two liquids;* this fact may indicate that the underlying water takes a part in the changes that occur).

It is not to be expected that there should be complete correspondence between the two classes of phenomena. There is, however, sufficient indication that the effects of thermal motions in the films cannot be neglected. The analogy with liquids and gases can be further illustrated by plotting FA against F, where F is the force applied per unit length; the resemblance to an Amagat diagram for a fluid is very striking (Schofield and Rideal, *Roy. Soc. Proc.* A, 109, p. 67; 110, p. 170). It is clear from the diagram that a film of myristic acid can be squeezed up until a molecule occupies less than 24 A^2. At the opposite end where the behaviour approaches that of a gas it is to be expected

that the equation would take the form $FA = RT$ where the value of R (allowing for only two degrees of freedom) should be 1·372 per molecule; at room temperature therefore FA should be about 400. This has been experimentally verified as a limiting value for very low surface pressures. With the long chain fatty acids, esters and nitriles it is approached within 25%, the pressure being below 0·1 dyne per cm. With the dibasic ester $C_2H_5OOC{\cdot}(CH_2)_{11}COOC_2H_5$ it has been verified within 10%.

The interpretation of the experimental results is still in a somewhat fluent state and it is clear that we must not press any *simple* gas analogy too far A thin film upon a body of different material cannot be treated as in a similar state to the molecules in the body of a gas. Forces must exist between the film and the liquid beneath This may account for the fact that at any rate some films do not spread indefinitely as a gas expands into a vacuum. Further, the most compressed state can only give an upper limit to the least cross sectional area of the molecule. The molecules are resting on the rapidly-moving molecules beneath them and must share to some extent in their agitation. Still it must be granted that these new investigations are throwing great light on the nature of films and on the dimensions of molecules. Where corroboration is possible, measurements made by means of X-rays are in good accord with those obtained by this method.

BIBLIOGRAPHY.—In addition to the specific references in the text, further sources of information are (the 3rd) Lord Rayleigh's *Collected Papers* (several articles), A. W Reinold and Sir A W Rucker, *Phil. Trans.* (1886), Sir W. Ramsay and J. Shields, *Zeitschr Phys Chem.* 12, p. 433 (1893), Harkins and Brown, *Am Chem Soc J.* (1916 and 1919); Richards, Speyers and Carver, *Am Chem Soc J.* (1921 and 1924); *Physical Phenomena at Interfaces* (Faraday Society, Dec. 1925); N. E. Dorsey, *Scientific Paper of the Bureau of Standards, Washington, D C.*, No. 540 1926 (this paper contains a survey of the various methods of measuring surface tension and a very complete bibliography of that part of the subject); on the theoretical side J. Willard Gibbs, *Collected Papers*, vol 1.; R. Eotvos, *Wied-Ann* (1886); J. D. van der Waals, G. Bakker and other writers of the Dutch school. Volume 6 of the *Handbuch der Experimentalphysik* (Wien-Harms), *Kapillaritat und Oberflachenspannung* by G. Bakker contains a very full account of the whole subject on the experimental side.

For certain properties of solutions *see* THERMODYNAMICS (applied to Chemistry). (A W. Po)

SURF-BIRD, a wading bird found along the Pacific coast of the Americas, from Alaska to Chile, and believed to nest on the north Alaskan tundra Grinnell, who observed the surf-bird in the region of Kotzebue Sound, says that he was informed by the Eskimos of the district that the birds nested in the neighbourhood of some small lakes far back on the tundra and not far from the base of the mountains; this confirms the observation of Nelson at St. Michael The surf-bird (*Aphriza virgata*), which is nowhere abundant, belongs to the family *Charadriidae*, the plover-like birds, and is placed by Knowlton between the turnstones and the oyster-catchers; it is distinguished from the turnstones by its longer tarsus, emarginate tail, and the swollen terminal portion of the bill. The surf-bird is 10 in. long, dusky, with a white rump.

SURGE, in meteorology, a term first used by Abercromby to denote a long period fluctuation of barometric pressure which seems to be superimposed upon the short period changes related to the passing of a low pressure centre.

SURGERY. The treatment of malformations and diseases by manual operation; secondarily, a medical practitioner's consulting room or office. Progress in the surgical art in the past century has in some measure run parallel with the advances made in all branches of science The full development of methods for producing anaesthesia (*q v.*) was the base upon which the progress and elaboration of surgery could be worked out. Study and improvement in anaesthetic methods have continued to the present time and the results have brought within the sphere of operation conditions which were previously beyond surgical aid.

Lister's discovery that a preventible bacterial infection was the cause of suppuration formed the next stage and upon it the development of modern surgery has been founded. By the employment of antiseptic and aseptic methods (*q.v.*) in the preparation of instruments, dressings and the patient's skin, it is now taken for granted that every operation will be carried out without the introduction of micro-organisms into the wound from without.

Advances in regard to these two controlling factors, anaesthesia and asepsis, during the past ten years have merely been developments of detail. Certain new substances have been employed as anaesthetics, both general and local, and minor improvements in apparatus and methods of administration have been introduced As a theoretical basis for surgery the maintenance of asepsis in all procedures has been long accepted, and no material alterations have been brought forward It must, however, be appreciated that asepsis is a relative term in regard to wounds of the body, micro-organisms in some numbers may be already present in the tissues, or are introduced despite every precaution. A more complete appreciation of this fact has emphasised the importance of avoiding any treatment of the body tissues which will lower their natural resistance to such mild infection as may be present.

General Principles of Operative Treatment.—Surgery has long passed the stage of being a handicraft Accurate diagnosis and the ability to estimate the risks of different types of operation in relation to the individual are essential to the equipment of a surgeon. The handicraft of surgery can be as rapidly acquired as that of carpentry; surgical judgment is only developed by long clinical experience and by the ability to learn from failure. In every major surgical operation the variable human factor is present. It may affect the issue of medical and surgical procedures both on psychological and physical grounds, and an appreciation of these possibilities and an acceptance of the limitations of the individual's resistance must always be in the mind of the surgeon when planning an operation. The physical condition of the patient in respect of the function of all essential organs can be assessed with some accuracy by modern methods. His psychological reaction is much less certain. In cases of operation for infective conditions the response to them of his natural defensive mechanism remains a factor of uncertainty. A good deal is known about the reaction of the body to bacterial infections (*see* IMMUNITY), but the problem of the artificial immunisation of the patient against them is still in its infancy. A consideration of these several problems on physiological lines has tended of late to divide operations for acute conditions into two or more stages.

Shock (*q.v.*).—A limit is set to any operation by the incidence of shock. This condition of collapse is secondary to several factors. In its most severe form it may prove directly fatal; its milder manifestations may considerably prejudice the patient's normal recovery. With good anaesthesia, careful haemostasis, and the avoidance of loss of body heat during operation, the condition is now seldom seen in the operating theatre

It is perhaps in place here to mention pulmonary embolism (*see* THROMBOSIS and EMBOLISM), a rare but serious complication of operations. It may follow a week or so after a simple surgical procedure which appears to have run a normal course The condition is produced by the impaction of a clot of blood in one of the lung arteries The clot originates in a vein in the operation area The size of the clot and the corresponding area of the lung deprived of blood determine the severity of the symptoms

Diagnosis.—Although the well established methods of clinical examination have not been superseded, the chief advances in surgical diagnosis of late years have been due to a more exact use of radiology (*q v.*). Though shadow pictures are open to misinterpretation and may mislead, these methods as a whole have led to much greater accuracy in the localisation of morbid conditions in various organs, or in establishing the fact that they are normal Advances in the chemical investigation of the blood and urine have made it possible to estimate the functional ability of the kidneys with considerable accuracy. The importance of this cannot be overestimated in considering the probabilities of survival of a patient after a major operation on the urinary system.

Preventive Surgery.—Though surgery cannot be regarded as a preventive art there are certain conditions in which it may be properly characterised as such The early recognition and removal of diseased lymphatic organs such as the tonsil and the appendix are undoubtedly reducing the incidence of certain chronic and

acute diseases which may follow the retention of a diseased organ in the body. Another example may be cited in the early operation on the common forms of hernia (*q.v.*). This condition is now customarily operated on almost as soon as it is recognised, frequently in childhood; as a result, the gross and disabling ruptures with their concomitant danger to life, commonly met with in the past century are now relatively rare. Preventive medicine on the other hand, is gradually removing, as it should, from the sphere of surgery many conditions hitherto treated by the knife. In most civilised communities, rickets (*q.v.*) has been eradicated or is treated so early that operation is seldom necessary.

Transplantation of Tissues.—Remarkable experimental results in animals have been published from time to time in regard to the transference of organs and tissues from one animal to another. These results in animals can be applied to a limited degree in man. It has not been found possible successfully to transplant organs or tissues of one species to another. Success in this respect can only be claimed if the transplant survives and retains its original cell form and functions. Skin, fascia and bone are the tissues which can be usefully transplanted from one part of the body to another.

Surgical Technique.—Pre-operative management of the patient will concern his general condition, the preparation for the anaesthetic and the cleansing of the skin in the operation area. Before an operation the patient should be in as good a physical state as possible. For one who is reduced or anaemic, infusion of fluid or even transfusion of blood may be required. In the case of a patient suffering from diabetes the proper dose of insulin or glucose is administered. As regards preparation for an anaesthetic, severe purging and prolonged starvation are now avoided. If the anaesthetic to be administered is ether, a small dose of atropine is given half an hour before the operation to limit the excretion of mucus in the air passages during the operation. Morphia is sometimes given beforehand to calm a nervous patient. Preparatory skin preparation need not exceed the dictates of ordinary cleanliness. The most generally employed method of sterilising the skin immediately before operation is after shaving to paint it with a solution of iodine or picric acid in spirit.

Sterilisation of Instruments, Dressings, etc.—This is effected by boiling them from five to fifteen minutes in water. Strong chemical antiseptics or spirit are often employed to sterilise edged instruments which would be blunted by boiling. Ligature materials used within the wound are now usually made of catgut. These are specially prepared (whereby different degrees of durability are obtained) and sterilised by various processes. Silk and thread are sometimes used for special purposes and are sterilised by boiling in water. Sutures for the skin, which are removable, are commonly made of silkworm or salmon gut and are sterilised in the same way. Dressings and wound coverings are most effectively disinfected by exposure in an autoclave to superheated steam at a temperature of about 250° F for 20 minutes. Sterilisation by hot air from its less penetrating power is limited in application to instruments which would be damaged by boiling in water. Formalin vapour is also of use for instruments of this type.

In all operations the surgeon wears a sterile gown, cap and mask, and protects his carefully cleansed hands with sterilised rubber gloves. During operation care to avoid shock to the patient on the lines already indicated is taken. The operating theatre is kept at a temperature above 70° F, and unnecessary exposure of the patient is avoided. When shock is inevitable infusion of saline solution or blood may be carried out during the operation.

After-treatment.—This will be directed to avoid the complications secondary to anaesthesia. The patient is kept warm in a well-ventilated room. Some vomiting is to be expected after ether anaesthesia. Fluid is administered in small quantities by the mouth as soon as the patient regains consciousness. In some conditions fluid administration may be given by the rectum or subcutaneously. Diet is kept to fluids for a few days. A measure of starvation at this stage, so long as plenty of fluid is given, does not prejudice the patient's recovery. A return to normal diet will depend upon the nature of the operation and the idiosyncrasy of the patient.

Treatment of Operative Wounds.—The normal clean surgical wound is dressed with sterile gauze which may be left in place till the stitches are due for removal; this will probably be about a week after operation. In those cases in which suppuration is present either as the result of a pre-existent abscess or from surgical infection, the wound will be drained by a tube or wick, and mild antiseptic dressings are applied at frequent intervals.

The period of time during which the patient is kept in bed necessarily depends on the mechanical state of affairs, especially in regard to abdominal wounds. In general, time will be given for substantial healing of the abdominal incision before the patient gets up—that is to say—two to three weeks.

REGIONAL SURGERY

The Brain.—Surgery of the brain (*see* Brain, Surgery of) is directed to the opening of abscesses and the removal of tumours. Considerable advance in the localization of the latter has led to a higher percentage of satisfactory results and a number of dramatic cures. It must, however, be appreciated that some tumours are so closely incorporated with the brain that their removal is impracticable or inconsistent with the survival of the patient. For these cases an operation of decompression is carried out which consists in removing a considerable area of bone from the skull to allow the brain to expand beneath the scalp. Such operations are directed to relieve the patient of headache and to save the sight. Operations on the spinal cord and nerves (*see* Spinal Cord, Surgery of) are mostly carried out for cases of injury; in the case of the former to relieve pressure, and in the latter to suture the cut ends of the nerve. Tumours may form in or about the cord, and their position can now be recognized.

Lungs (*see* Heart and Lung, Surgery of).—The chest has always been considered a difficult area for the surgeon to work in. The presence of negative pressure in the pleural sac leads to the collapse of the lung when the chest wall is opened, and enterprise in the direction of radical surgery has on this account been limited. With the introduction of anaesthesia by intubating the larynx and pumping air containing ether under positive pressure into the lung, intrathoracic operations are now made with safety.

Thyroid Gland (*see* Goitre).—Operations on this essential ductless gland are carried out for simple and malignant tumours and also for disorders of secretion. In exophthalmic goitre, the gland becomes hyper-active and though the condition may in some measure be controlled by administration of iodine, the removal of half or even more of the gland has proved the most successful method of treating severe cases. At one time, operations of this character were associated with a high mortality, but with improved methods of pre-operative treatment and of anaesthesia the results have been much more satisfactory. The operations for simple tumour are straightforward and call for little comment; in those instances in which the whole gland is removed for malignant disease the complete loss of thyroid solution thereby entailed must be made up for subsequently by the regular administration of thyroid extract (*cf.* myxoedema).

Breast (*see* Mammary Gland, Diseases of).—This organ especially in the female, may develop simple tumours (adenoma), or undergo a change classified as chronic mastitis; it is a relatively common seat of cancer (*q.v.*). The simple tumours appear as a rule before middle age and are easily recognized and removed. Chronic interstitial mastitis is essentially a disease of the middle-aged; though in itself not a very serious condition, there is little question but that its more severe forms predispose towards cancer. On these grounds removal of one or both breasts for the condition is very often carried out. Cancer of the breast is rare before middle age and is most commonly met with between forty-five and sixty-five. Usually it starts as a painless hard

nodule in the breast; it causes no signs of inflammation nor does it interfere in any way with the muscular system. On this account an early growth may be missed by an unobservant patient. The surgical treatment of cancer in this organ has proved strikingly successful in cases in which a radical operation is carried out before secondary deposits have appeared elsewhere The outlook in cases in which operation is undertaken at a later stage is very much less hopeful. The operation current at the present time for cancer is a thorough one, and consists of removing the whole breast with the overlying skin and underlying muscle. The armpit is freely opened up and the lymphatic channels from the breast and the glands into which they drain are cleanly removed The value of X-rays and radium in the treatment of breast cancer is becoming more clearly defined; there is no doubt that a certain type of X-ray and the gamma rays of radium are able to kill cancer cells locally, and both methods have considerable value in dealing with local recurrent growth and as prophylactic measures (*see* RADIOLOGY; RADIOTHERAPY, RADIUMTHERAPY)

Abdominal Surgery (*see* ABDOMEN, SURGERY OF).—In the case of the stomach and duodenum—the diagnosis of simple ulcers and cancerous growths of the stomach has been greatly advanced by radiological methods. The method does not consist in simply taking a shadow picture of the stomach. Chief reliance is placed on observation of the stomach movements by a trained observer. It must not however be thought that this is the only or the final method of diagnosis Clinical observation and the chemical examination of test meals are essential and often carry equal weight in forming an opinion as to the exact condition.

Operation is much less frequently undertaken for active gastric and duodenal ulcer (*q v*) now than a few years back. It still remains the only radical method of dealing with long-standing ulcers which have led to adhesions of the stomach and surrounding structures or to narrowing of its lumen either in the body of the organ or at its junction with the duodenum. The simplest operation is that of gastro-enterostomy, which consists of short-circuiting the distal part of the stomach and duodenum by anastomosing a loop of adjacent small bowel direct to the stomach. A part of the stomach may be removed for chronic ulcer as it is for cancer; indeed very nearly the whole stomach has been successfully removed for this condition, an anastomosis being subsequently established between the cut upper end and the small bowel Surgery offers the only satisfactory means known at the present to deal with cancer of the stomach

Gall Bladder.—The gall bladder forms a reservoir for bile though it has nothing to do with the secretion of this fluid. Gall stones (*see* CALCULI) may be deposited in it and lead to attacks of acute pain if they are forced out of the gall bladder into the bile passages. The presence of stones may also irritate the bladder and lead to abscess formation. The diagnosis is usually made clinically although the shadow of the gall bladder outline can be obtained by injecting a chemical into the blood, and in some instances gall stones show up in radiographs. The operation at the present time most often performed is complete removal of the gall bladder including the stones.

Large Bowel.—Considerable sections of the large bowel can be removed for growths which are usually malignant Sections of the bowel may also be cut out on account of inflammatory conditions. After resection of part of the bowel the lumen is reconstituted by an anastomosis. This may be effected by stitching the two cut ends of the tube together directly, or by laying them side to side and making a lateral communication after stitching up the ends. Cases of intestinal obstruction due to irremovable causes in the lower part of the bowel are treated by colostomy. This operation consists in bringing up to the surface a section of the bowel and opening it. The artificial anus so formed will drain the bowel effectively, but the condition has the inconvenience that it is not subject to any sphincter control.

Rectum and Anus.—The rectum is subject to similar growths and inflammatory conditions to those met with in the colon If a cancer of the rectum is recognized early, its radical removal gives a very good proportion of cures. It is inevitable in all such cases for the sphincter mechanism of the bowel to be destroyed by the operation and the patient is therefore left with a colostomy.

An anal fistula (*see* FISTULA) consists of a communication between the lower part of the rectum and the surface. It usually follows the formation of spontaneous evacuation of an abscess in this area The condition can only be effectively cured by laying open the whole fistulous tract, and leaving it to heal slowly by granulation

Haemorrhoids (*q.v.*) are due to a varicose condition of the veins in the lower part of the rectum. They may cause prolapse of the mucous lining of the lower end of the rectum or they may become grossly inflamed and painful Slight damage to them may lead to troublesome haemorrhage The condition is usually quite a local one and can be dealt with successfully by several means. Injection of the piles with chemical solution will produce clotting or scarring of the vascular area sufficient to cure the slighter cases of internal haemorrhoids. More severe persistent cases are better dealt with by operations of excision and ligature

Kidneys and Bladder. (*See* UROLOGY; BLADDER AND PROSTATE DISEASES.)—The accurate diagnosis of the diseases of the kidney and bladder have made great advances in the last ten years as the result of the perfection of instruments for inspecting the inside of the bladder and passing catheters up the ureters. The injection of opaque solutions into the cavity of the kidneys enables a radiograph to be taken which assists considerably in diagnosis. Better radiological technique has also increased the accuracy with which the presence of a stone and its position in the kidney can be made out. The estimation of the functional activity of the kidney by mechanical means has been put on a scientific basis and makes it possible for the surgeon to assess the patient's probable reaction to operations in this area

Stone in the Kidney—Operations for stone located in the kidneys are straightforward if the stone be small in size and when only one kidney is affected It is not uncommon for more than one stone to be present, and there is considerable variety in their form and nature, which affect the liability to recurrence A stone may be passed from the kidney down the ureter into the bladder, and if it is sufficiently small, may even be evacuated naturally. The prolonged presence of a stone in the kidney, especially if it leads to a partial obstruction in the outlet, results in inflammation of the kidney substance, and for this reason early recognition of a stone by X-rays and its radical removal are important

Tuberculous Kidney and Bladder—Tuberculosis of the kidney may appear as the main focus of tuberculous infection in the body In such cases the organism must, however, have been conveyed by the blood system from some previously established focus elsewhere. A tuberculous infection of the kidney may be part of a diffused tuberculous infection or one involving the whole urinary system In the case of limited and early disease of one kidney, the symptoms may be slight, and the recognition of the presence of the infection will depend upon finding of B tuberculosis in the urine. In such cases, or in those in which the disease is more advanced but has remained localized, the excision of one kidney is practiced with satisfactory results

Tuberculosis of the bladder is usually secondary to the presence of this infection in some other part of the genito-urinary tract. It leads to great irritability of the bladder and corresponding discomfort to the patient Treatment of the condition by direct surgical means is clearly difficult, and is seldom attempted.

Enlargement of the Prostate.—This condition affects males above middle life. The enlarged gland, situated as it is, at the neck of the bladder, tends gradually to interfere with the proper evacuation of this organ. This may produce attacks of complete retention of urine or result in the development of cystitis The continued existence of the condition produces in time by the effect of back pressure or infection, secondary damage to the kidneys. This will materially sap the patient's resistance to infection or indeed in itself produce a condition inconsistent with life, if the suppression of the function of the kidneys is carried far enough. The relief of prostatic obstruction may be temporarily effected by the passage of a catheter to empty the bladder at regular intervals, but as this process is not a convenient one and in itself is bound to lead to the establishment of chronic cystitis, radical removal of

the enlarged prostate is usually carried out.

The operation is usually effected by opening the bladder through an abdominal incision and gaining access to the base of the bladder in this way. In some clinics approach to the enlarged gland is by the perineum. In view of the age of the patients affected by this condition, the operation must be considered a severe one. The mortality has been considerably reduced in the last ten years by modifications in technique and by the carrying out of the procedure in two stages in those instances in which chronic cystitis is present or where there is evidence of disturbed function of the kidneys from back pressure.

Cancer of the prostate occurs and may be associated with similar symptoms to those of simple enlargement of the organ. Operative removal of the cancerous gland is practised, but on account of its anatomical position the probabilities of recurrence are great.

New Growths of the Kidney and Bladder.—The kidney and bladder may be involved in new growths which may be either simple or cancerous. The symptoms are generally evidenced by the passing of blood and disturbance in the regular evacuation of the bladder. In the case of the kidney, complete removal of the growth, if recognized early, is a simple and satisfactory procedure. In the bladder complete removal of malignant growths is difficult, consistent with the maintenance of the normal function of the organ.

Stricture of the Urethra.—Stricture of the urethra is due to contraction of scarred tissue in and around the tube secondary to old-standing inflammation. The closing down of the urethra leads to a gradual difficulty in emptying the bladder and indeed to a group of symptoms similar to those observed in enlargement of the prostate; the condition, however, usually develops much earlier in life and will be associated with a previous history of urethral infection. The condition in the early stages can be treated by regular dilation of the stricture with suitable bougies. If it is allowed to develop to the stage of complete obstruction associated with retention of urine, various operations for the relief of the condition may have to be brought into play.

Testicle.—This may be the seat of new growths which are generally cancerous or tuberculous. The statements made in regard to similar conditions affecting the kidney apply in general to this organ. On account of its accessibility early diagnosis and prompt treatment are relatively easy.

The condition of hydrocele (*q.v.*) is due to the secretion of fluid in the serous sac covering the testicle. The condition may arise apart from injury at almost any period of life. The largest forms are seen in those past middle-age. Radical treatment by excision of the sac is simple and straightforward.

Hernia (*q.v.*).—There are certain areas in the abdominal wall which are naturally weak and through these a protrusion or pouch of the peritoneum is liable to prolapse, producing a hernia. These regions are at the groins and umbilicus. Herniae are also likely to form in weak abdominal scars following operations. Apart from the discomfort caused by the prolapse of bowel into the hernia, there is always a danger of its contents becoming constricted or obstructed (*see* INTESTINAL OBSTRUCTION) by being nipped at the margin of the opening through which the protrusion has occurred. If such a complication arises it leads to strangulation which is an almost inevitably fatal condition unless relieved by prompt operation. The surgery of hernia should clearly be of a prophylactic nature and be undertaken as early as possible after the development of the swelling. Radical operations for herniae undertaken nowadays in good time on healthy individuals are followed by a high proportion of permanent successes. (C. M. P.)

SURGICAL INSTRUMENTS AND APPLIANCES. The chief fact about the surgery of the present day, that it is aseptic or antiseptic, is exemplified in the make of surgical instruments and in all the installation of an operating-theatre. Take, for instance, a scalpel and a saw that are figured in Ambroise Paré's (1510–1590) surgical writings. The scalpel folds into a handle like an ordinary pocket-knife, and the handle is most elegantly adorned with a little winged female figure. The saw, after the same fashion, has a richly chased metal frame, and, at the end of the handle, a lion's head in bold relief, with a ring through its mouth to hang it up by. If one contrasts with these artistic weapons the instruments of 1850, one finds no such adornment, and for general finish Savigny's instruments would be hard to surpass; but the wooden or ivory handles, cut with finely scored lines like the cross-hatching of an engraving, are not more likely to be aseptic, even with prolonged attempts at sterilization, than the handles of Paré's instruments. At the present time, instead of such handles as these, with blades riveted into them, scalpels are forged out of one piece of steel, their handles are nickel-plated and perfectly smooth, that they may afford no crevices, and may be boiled and immersed in carbolic lotion without tarnishing or rusting; the scalpel has become just a single, smooth, plain piece of metal, having this one purpose that it shall make an aseptic wound. In the same way the saw is made in one piece, if this be possible; anyhow, it must be, so far as possible, a simple, smooth, unrusting metal instrument, that can be boiled and laid in lotion.

Or we may take, at different periods of surgery, the ligatures for arrest of bleeding from a divided blood-vessel. In Paré's time the ligature was a double thread, and he employed a forceps to draw forward the cut end of the vessel to be ligatured. From the time of Ambroise Paré to the time of Lister no great improvement was made. Then came Lister's work on the absorbable ligature; and out of this and much other experimental work has come a sterile thread that can be tied, cut short, and left in the depth of the wound, with certainty that the wound may at once be closed from end to end and nothing more will ever be heard of the ligatures left buried in the tissues.

Much the same is true of surgical dressings. When inflammation and suppuration were almost inevitable, dressings were usually such as could be easily and frequently changed—ointment, or wet compresses, to begin with, and poultices when suppuration was established. Now, after passing through a period when they were impregnated with some antiseptic, they are usually non-medicated but rigidly aseptic, and applied dry and are changed as little as possible in every aseptic operation.

The great principle of aseptic surgery combined with discovery of anaesthetics led to a great enlargement of the field in which surgical operations could be undertaken. As a result instruments for special purposes were devised that were without counterpart in olden times while appliances such as the laryngoscope, ophthalmoscope, cystoscope, sigmoidoscope, bronchoscope were invented and facilitated diagnosis. These means of improved diagnosis, in their turn, pointed the way towards yet more specially derived instruments so that the modern instrument maker's catalogue is a bulky and profusely illustrated volume.

SURICATE or **MEERKAT** (*Suricata tetradactyla*), a small South African mammal of the civet family, ranging from Cape Colony to Algoa bay. The head and body are about 14in. long, and the tail half as much; the fur is long and soft, light grizzled grey in colour, and banded with black on the lower part of the back. Meerkats are sociable animals, living in holes in the rocks on the mountains, and burrowing in the sandy soil of the plains. They feed chiefly on succulent bulbs, which they scratch up with long, curved, black claws on their fore-feet. They are often domesticated as pets.

SURIGAO, a municipality (with administration centre and 14 *barrios* or districts), capital and port of the province of Surigao, which is located in north-east Mindanao, and adjacent small islands, Philippine islands, 459 m. from Manila. Pop. (1918), 15,772. Some valuable timber grows in the vicinity, and there is a gold mine nearby. Abacá, corn and copra are among the agricultural products. In 1918, it had three manufacturing establishments and 164 household industry establishments with outputs valued at 45,300 and 40,500 pesos respectively. Of the 16 schools, 14 were public. Many of the inhabitants are Bisayans.

SURINAM: *see* GUIANA, *Dutch.*

SURINAM TOAD (*Pipa americana*), an aglossal (tongueless) tailless Amphibian (*q.v.*). It inhabits S. America east of the Andes and north of the Amazon, and is thoroughly aquatic. It

has an extremely flattened head; the snout and the angles of the jaws bear several lappets, the fingers terminate in a star-shaped appendage, and the eyes are minute and without lids

The eggs are carried on the back by the mother, and the skin thickens and grows round the eggs until each is enclosed in a dermal cell, which is finally covered by a horny lid The eggs, which may number about 100 and measure 5–7mm in diameter, develop entirely within these pouches, and the young hop out in the perfect condition. Pairing takes place in the water, the male clasping the female round the waist During oviposition the cloaca projects from the vent as a bladder-like pouch, which is inverted forwards, between the back of the female and the breast of the male, and by means of this ovipositor the eggs are evenly distributed over the back *See* A. D Bartlett, *Proc. Zool Soc* (1896).

SURMA or **BARAK,** a river of Assam, India. It is one of the two chief rivers of the province, watering the southern valley as the Brahmaputra waters the northern and larger valley It rises in the Barail range to the north of Manipur, its sources being among the southern spurs of Japvo Thence its course is south with a slight westerly bearing, through the Manipur hills to British territory The name of Barak is given to the upper part of the river, in Manipur and Cachar. A short distance below Badarpur in Cachar it divides into two branches The northern, which passes Sylhet, is called the Surma. The southern, which is called the Kusiara, subdivides into two branches, one called Bibiana or Kalni, and the other the Barak, both of which rejoin the Surma At Bhairab Bazar in Mymensingh the Surma unites with the old channel of the Brahmaputra and becomes known as the Meghna until it joins the Ganges between Narayanganj and Chandpur The river is navigable by steamers as far as Silchar in the rains Total length about 560 miles

SURPLICE (Lat *super,* over, and *pellicia,* furs), a liturgical vestment of the Christian Church. It is a tunic of white linen or cotton material, with wide or moderately wide sleeves, and varying in length Originally it reached to the feet, but as early as the 13th century it began to be shortened This process was carried furthest in the Roman use, according to which the surplice (the Italian *cotta*) hardly reaches to the hips In other churches of the Roman communion it does not come below the knees

The older history of the surplice is obscure Its name is derived from the fact that it was formerly put on over the fur garments which used to be worn in church as a protection against the cold In all probability the surplice is no more than an expansion of the ordinary liturgical alb, due to the necessity for wearing it over thick furs It is first mentioned in the 11th century, in a canon of the synod of Coyaca in Spain (1050) and in an ordinance of King Edward the Confessor In Italy it was known at least as early as the 12th century It probably originated outside Rome, and was imported thence into the Roman use

Originally only a choir vestment and peculiar to lower clergy, it gradually (certainly no later than the 13th century) replaced the alb as the vestment proper to the administering of the sacraments and other sacerdotal functions.

In the Oriental rites there is no surplice, nor any analogous vestment. Of the non-Roman Catholic churches in the West the surplice has continued in regular use only in the Lutheran churches of Denmark, Norway and Sweden, and in the Church of England

Church of England.—The surplice was prescribed by the second Prayer-Book of Edward VI as, with the tippet or the academical hood, the sole vestment of the ministers of the church at "all times of their ministration," the rochet (q.v.) being practically regarded as the episcopal surplice. Its use was furiously assailed by the extremer Reformers but, in spite of their efforts, was retained by Elizabeth's Act of Uniformity, and enforced by the advertisements and injunctions issued under her authority, which ordered the "massing vestments" (chasubles, albs, stoles, and the like) to be destroyed (*see* VESTMENTS). Its use has never been confined to clerks in holy orders, and it has been worn since the Reformation by all the "ministers" (including vicars-choral and choristers) of cathedral and collegiate churches, as well as by the fellows and scholars of colleges in chapel

The traditional form of the surplice in the Church of England is that which survived from pre-Reformation times; viz., a wide-sleeved, very full, plain, white linen tunic, pleated from the yoke, and reaching almost, or quite, to the feet Towards the end of the 17th century, when large wigs came into fashion, it began for convenience to be constructed gown-wise, open down the front and buttoned at the neck, a fashion which still partially survives, notably at the universities.

SURRENDER, in law, a mode of alienation of real estate. It is defined by Lord Coke to be "the yielding up of an estate for life or years to him that hath an immediate estate in reversion or remainder" (Coke upon Littleton, 337 b) It is the converse of release, which is a conveyance by the reversioner or remainderman to the tenant of the particular estate A surrender was the usual means of effecting the alienation of copyholds (*q v*) A surrender must, since the Real Property Act 1845, be by deed, except in the case of copyholds and of surrender by operation of law (*See* REMAINDER)

In Scots law surrender of a lease is represented by renunciation The nearest approach to surrender of a copyhold is resignation *in remanentiam* (to the overlord) or resignation *in favorem* (to a purchaser). These modes of conveyance were practically superseded by the Conveyancing Act 1874

In America surrender divides itself into express surrender and surrender by operation of law The former is the surrender known to the early common law; the latter takes place when the tenant and the reversioner have performed acts inconsistent with the continued existence of the two former distinct estates, from which acts the law implies that a surrender has been made Thus where there is an acceptance by the tenant of a new lease to begin at any time during the existence of the previous lease, or the relinquishment of possession by the tenant and the resumption of possession by the landlord, a surrender by operation of law is deemed to have taken place

SURRENTUM (mod. *Sorrento, q.v*), an ancient town of Campania, Italy, situated on the north side of the promontory which forms the south-east extremity of the Bay of Naples The most important temples of Surrentum were those of Athena and of the Sirens (the latter the only one in the Greek world in historic times) The place was famous for its wine, its fish and its red Campanian vases It was protected by deep gorges, except for a distance of 300 yd on the south-west where it was defended by walls, the line of which is necessarily followed by those of the modern town The south gate is indeed ancient The arrangement of the modern streets preserves that of the ancient town, and the disposition of the walled paths which divide the plain to the east seems to date in like manner from Roman times. On the east of the town the most important ancient ruin is the reservoir of the (subterranean) aqueducts, which had no less than 27 chambers, each about 90 ft by 20 feet There are also remains of villas To the north-west, on the Capo di Sorrento, is another villa, the so-called Bagni della Regina Giovanna, with baths, and in the bay to the south-west was the villa of Pollius Felix, the friend of Statius, of which remains still exist Some fine reliefs were found here, representing a sacrifice to Diana (A. Levi in *Monumenti dei Lincei,* xxvi , 181–218, 1920).

SURREY, EARLDOM OF. This earldom is of uncertain but unquestionably early origin A Norman count, William de Warenne (*c.* 1030–1088), is generally regarded as its first holder and is thought to have been made an earl by William II about 1088. William and his successors were styled earls of Surrey or Earls Warenne indifferently, and the family became extinct when William, the 3rd earl, died in 1148. The second family to hold the earldom of Surrey was descended from Isabel de Warenne (d 1199), daughter and heiress of Earl William, and her second husband Hamelin Plantagenet (d. 1202), an illegitimate half-brother of King Henry II. Their descendants held the earldom until Earl John died without legitimate issue in 1347.

The earldom and estates of the Warennes now passed to John's nephew, Richard Fitzalan, earl of Arundel (*c.* 1307–1376), being forfeited when Richard's son, Richard, was beheaded for treason in 1397. Then for about two years there was a duke of Surrey, the title being borne by Thomas Holand, earl of Kent (1374–

1400), from 1397 until his degradation in 1399. In 1400 Richard Fitzalan's son, Sir Thomas Fitzalan (1381–1415), was restored to his father's honours and became earl of Arundel and earl of Surrey, but the latter earldom reverted to the Crown when he died. In 1451 John Mowbray (1444–1476), afterwards duke of Norfolk, was created earl of Surrey, but the title died with him.

The long connection of the Howards with the earldom of Surrey began in 1483 when Thomas Howard, afterwards duke of Norfolk, was created earl of Surrey. Since then, with brief exceptions, the title has been borne by the duke of Norfolk.

See the articles WARENNE, EARLS; and ARUNDEL, EARLS OF; also G. E. C.(ockayne), *Complete Peerage*, vol. vii. (1896).

SURREY, HENRY HOWARD, EARL OF (1518?–1547), English poet, son of Lord Thomas Howard, afterwards 3rd duke of Norfolk, and his wife Elizabeth Stafford, daughter of the duke of Buckingham, was born probably in 1518. He succeeded to the courtesy title of earl of Surrey in 1524, when his father became duke of Norfolk. His early years were spent in the various houses of the Howards, chiefly at Kenninghall, Norfolk; he used also to stay at Windsor with young Henry Fitzroy, duke of Richmond, of whom his father was guardian. Anne Boleyn tried to arrange a marriage between the princess Mary and her kinsman, Surrey. The Spanish ambassador, in the hope of detaching the duke of Norfolk's interest from Anne Boleyn in favour of Catherine of Aragon, seems to have been inclined to favour the project, but Anne changed her mind, and as early as October 1530 arranged a marriage for Surrey with Lady Frances de Vere, daughter of the 15th earl of Oxford. This was concluded at the earliest possible date, in February 1532, but in consequence of the extreme youth of the contracting parties, Frances did not join her husband until 1535. In October Surrey accompanied Henry VIII. to Boulogne to meet Francis I., and, rejoining the duke of Richmond at Calais, he proceeded with him to the French court, where the two Englishmen were lodged with the French royal princes. Surrey created for himself a reputation for wisdom, soberness and good learning. Meanwhile in spite of his marriage with Frances de Vere, the project of a contract between him and the princess Mary was revived in a correspondence between the pope and the emperor, but rejected by the latter. Surrey returned to England in the autumn of 1533, when the duke of Richmond was recalled to marry his friend's sister, Mary Howard. Surrey made his home at his father's house of Kenninghall, and took his father's side in a dispute which led to a separation between the duke and duchess.

In May 1536 he filled his father's functions of earl marshal at the trial of his cousins Anne Boleyn and Lord Rochford. In the autumn of that year he took part with his father in the bloodless campaign against the rebels in Yorkshire and Lincolnshire, in the "Pilgrimage of Grace." Hasty in temper, and by no means friendly to the Seymour faction at court, Surrey struck a man who insinuated that he had secretly favoured the insurgents. For breaking the peace in the king's domain he was arrested (1537), but thanks to Cromwell, he was merely sent to reside for a time at Windsor. During this retirement he had leisure to devote himself to poetry. In 1539 he was again received into favour. In May 1540 he was one of the champions in the jousts celebrated at court.

The fall of Thomas Cromwell a month later increased the power of the Howards, and in August Henry VIII. married Surrey's cousin, Catherine Howard. Surrey was knighted early in 1541, and soon after he received the Garter and was made chancellor of the duchy of Lancaster. In 1542 he was imprisoned again for quarrelling, but was soon liberated. Shortly after his release he joined his father on the Scottish expedition. They laid waste the country, but retreated before the earl of Huntly, taking no part in the victorious operations that led up to Solway Moss.

Surrey's ties with Wyat, who was fifteen years his elder and of opposite politics, seem to have been rather literary than personal. He appears to have entered into closer relations with the younger Wyat, with whom he got into trouble for breaking the windows of the citizens of London on Feb. 2, 1543. In prison for this offence he probably wrote the satire on the city of London, in which he explains his escapade by a desire to rouse Londoners to a sense of their wickedness. In October he joined the English army co-operating with the imperial forces in Flanders, and in the campaign of the next year he served as field marshal under his father, and took part in the unsuccessful siege of Montreuil. In August 1545 he was again serving in France.

Surrey had always been an enemy to the Seymours, whom he regarded as upstarts, and he thwarted the proposed marriage of his sister, the duchess of Richmond, with Sir Thomas Seymour. He thus increased the enmity of the Seymours and added his sister to the already long list of the enemies which he had made by his haughty manner and brutal frankness. He was now accused of quartering with his own the arms of Edward the Confessor. The charge was a pretext covering graver suspicions. Surrey had declared that his father, the duke of Norfolk, as the premier duke in England, had the obvious right of acting as regent to Prince Edward. He also boasted of what he would do when his father had attained that position. This boast was magnified into a plot on the part of his father and himself to murder the king and the prince. The duke of Norfolk and his son were sent to the Tower on Dec. 12, 1546. The duchess of Richmond was one of the witnesses (*see* her depositions in Herbert of Cherbury, *Life and Reign of Henry VIII.*, 1649) against her brother, but her statements added nothing to the formal indictment. On Jan. 13, 1547 Surrey defended himself at the Guildhall on the charge of high treason for having illegally made use of the arms of Edward the Confessor, before hostile judges. He was condemned by a jury, packed for the occasion, to be hanged, drawn and quartered at Tyburn. This sentence was commuted to beheading. Surrey was executed on Tower Hill on the 19th of the month.

Surrey's name has been long connected with the "Fair Geraldine," to whom his love poems were supposed to be addressed. The story is founded on the romantic fiction of Thomas Nashe, *The Unfortunate Traveller, or Life of Jack Wilton* (1594), according to which Surrey saw in a magic glass in the Netherlands the face of Geraldine, and then travelled throughout Europe challenging all comers to deny in full field the charms of the lady. At Florence he held a tournament in her honour, and was to do the same in other Italian cities when he was recalled by order of Henry VIII. The legend, deprived of its more glaring discrepancies with Surrey's life, was revived in Michael Drayton's *England's Heroicall Epistles* (1598). Geraldine was the daughter of the earl of Kildare, Lady Elizabeth Fitzgerald, who was brought up at the English court in company with the princess Elizabeth. (*See* James Graves, a *Brief Memoir of Lady Elizabeth Fitzgerald,* 1874.) She was ten years old when in 1537 Surrey addressed to her the sonnet "From Tuskane came my ladies worthy race," and nothing more than a passing admiration of the child and an imaginative anticipation of her beauty can be attributed to Surrey.

His poems, which were the occupation of the leisure moments of his short and crowded life, were first printed in *Songs and Sonettes written by the ryght honorable Lorde Henry Howard late Earle of Surrey, and other* (apud Richardum Tottel, 1557). A second edition followed in July 1557, and others in 1559, 1565, 1567, 1574, 1585 and 1587. Although Surrey's name, probably because of his rank, stands first on the title-page, Wyat was the earlier in point of time of Henry's "courtly makers." Surrey, indeed, expressly acknowledges Wyat as his master in poetry. His sonnets, his elegy on Wyat and his lyrics served as models to generations of court poets.

As their poems appeared in one volume, long after the death of both, their names will always be closely associated. Surrey's contributions are distinguished by their impetuous eloquence and sweetness, and he introduced new smoothness and fluency into English verse. His chief innovation as a metrician lies outside the *Miscellany*. His translation of the second and fourth books of the *Aeneid* into blank verse—the first attempt at blank verse in English—was published separately by Tottel in the same year *Certain Bokes of Virgiles Aeneis turned into English meter.*

See Professor E. Arber's reprint of *Songs and Sonettes* (*English Reprints,* 1870); the Roxburghe Club reprint of *Certain Bokes of Virgiles Aeneis* (1814); Dr. G. F. Nott, *The Works of Henry Howard, Earl of Surrey* (1815); and *The Poetical Works of Henry Howard, Earl of Surrey* (Aldine edition, 1866). The best account of Surrey's life is in Edmond Bapst's *Deux Gentilhommes-poëtes de la cour de Henry*

VIII (1891), which rectifies Dr. Nott's memoir in many points. *See* also Brewer and Gairdner, *Letters and State Papers of Henry VIII.*; Lord Herbert of Cherbury, *Life and Raigne of Kinge Henry the Eighth* (1649), J A. Froude, *History of England* (chs xxi and xxii); W J Courthope, *History of English Poetry* (1897), vol. ii ch iii, where the extent and value of Surrey's innovations in English poetry are estimated; F. M. Padelford, *The MS Poems of Henry Howard, Earl of Surrey* (1906), O. Fest, "Über Surreys Virgilübersetzung," in *Palastra*, vol. xxxiv. (Berlin, 1903).

SURREY, a south-eastern county of England, bounded north by the Thames, separating it from Buckinghamshire and Middlesex, east by Kent, south by Sussex, and west by Hampshire and Berkshire. The administrative county of London bounds that of Surrey (south of the Thames) on the north-east. The area is 758 sq. miles The north of the county is low lying, the eastern part consisting of the London clay, the western of the Bagshot beds. Near the western boundary the land rises into the low Chobham ridges Across the middle of the county, from east to west, run the North downs, composed of chalk. In the east they form a wide band with an extreme height of 852 ft., but westward they narrow into the Hog's Back. The line of the Downs is broken at two points. by the river Mole between Dorking and Leatherhead, and by the Wey near Guildford. These are the two chief rivers in the county, and they join the Thames at Molesey and Weybridge respectively The northern slopes of the Downs are flanked by a narrow strip of Lower London Tertiary beds, the southern by narrow bands of Upper Greensand and Gault. These beds, like the chalk, have a wider extent in the east than in the west. To the south of the Gault we find a wide band of Lower Greensand, which narrows eastward. On this greensand is found the highest land in the county, Leith Hill (965 ft.) near the centre, and Devil's Punch Bowl (895 ft) in the west. The rest of the county, except for a small triangle of Hastings beds in the extreme south-east, is composed of Weald clay.

The chief evidence of the presence of Palaeolithic man in Surrey comes from various gravels near Limpsfield (in the east of the county), near Guildford and Godalming, and near Farnham. The Weald region in early times was very thickly forested, and traces of Neolithic man, indicated by finds of implements, are therefore most numerous on the chalk and greensand, especially in the west, but finds of this age are not rare on the lower lands in the north-east of the county. Bronze weapons have not been found in such great numbers as those of stone, but their distributions are, roughly, coincident except that the metal weapons have been found at several places along the Thames.

Near the chalk ridge of the North downs runs the ancient track of the Pilgrims' way. A track here was used in very early times to connect the cultural centre of Kent with Hants and Wiltshire; in the middle ages the route regained importance as the path of pilgrims from the west to the shrine of St Thomas at Canterbury. The Romans did not occupy Surrey very closely, but there are traces of their influences in the remains of one or two small settlements and a few villas.

The county was penetrated by the English invaders at a fairly early date, and its position between the Thames and the Weald decided its northern and southern borders The Kentish boundary probably dates from the battle of Wibbandune, between Ethelbert of Kent and Ceawlin of Wessex, while the western limit in a wild, uncultivated district was not then strictly defined. In the 7th century Surrey was under the overlordship of Wulfhere, king of Mercia, who founded Chertsey abbey, but in 823, when the Mercians were defeated by Egbert of Wessex, it was included in the kingdom of Wessex, as the Anglo-Saxon Chronicle relates.

Surrey was constantly overrun by Danish hordes in the 9th century and until peace was established by the accession of Canute In 857 a great national victory over the Danes took place at Ockley, near Leith Hill. The Norman army traversed and ravaged the county in their march on London. A large portion of the county having been in the hands of Edward and Harold, fell to the share of William himself; his most important tenants in chief being Odo of Bayeux and Richard de Tonebridge, son of Count Gilbert, afterwards "de Clare" The church also had large possessions in the county, the abbey of Chertsey being the largest monastic house. At the time of the Domesday survey the number of hundreds was 14 as now, but the hundred of Farnham was not so called, the lands of the bishop of Winchester being placed in no hundred, but coinciding with the present hundred of that name The western boundary of the county was probably definitely fixed about this time Until quite recently Surrey had never been in any diocese but Winchester, of which it was an archdeaconry in the 12th century. Croydon was a peculiar of Canterbury, in which diocese it was included in 1291. The shire court was almost certainly held at Guildford, the seat of the royal court at times during the reigns of John and Henry III.

From 1290 to 1832 the shire returned two knights to parliament There have been several adjustments of electoral divisions since 1832.

Architecture.—The only ecclesiastical ruins worthy of special mention are the walls of Newark priory, near Woking, founded for Augustinians in the time of Richard Coeur de Lion; and the Early English crypt and part of the refectory of Waverley abbey, the earliest house of the Cistercians in England, founded in 1128 Among the more interesting churches are Albury (the old church), near Guildford, the tower of which is of Saxon or very early Norman date; Beddington, a fine example of Perpendicular; Chaldon, remarkable for its fresco wall-paintings of the 12th century, discovered during restoration in 1870; Compton, worthy of notice for its two-storeyed chancel and its carved wooden balustrade surmounting the pointed transitional Norman arch which separates the nave from the chancel; Leigh, Perpendicular, possessing some very fine brasses of the 15th century; Lingfield, Perpendicular, containing some fine stalls (the church was formerly collegiate); Ockham, chiefly Decorated, with a lofty embattled tower; Stoke d'Abernon, Early English, with the earliest extant English brass (1277). Of ancient domestic architecture, examples include Beddington Hall, retaining the hall of the Elizabethan building; Crowhurst Place, built in the time of Henry VII.; portions of Croydon palace, an ancient seat of the archbishops of Canterbury; the gate tower of Esher Place, built by a bishop of Winchester, and repaired by Cardinal Wolsey; Archbishop Abbot's hospital, Guildford, in the Tudor style, the Elizabethan house of Loseley near Guildford, Sutton Place near Woking, dating from the time of Henry VIII, possessing curious mouldings and ornaments in terra cotta; and Ham House, of red brick, dating from 1610

Industries.—Surrey was at first agricultural The stone quarries of Limpsfield and the chalk of the Downs were early used, the latter chiefly for lime-making. Fuller's earth was obtained from Reigate and Nutfield, and the facilities afforded by many small streams, and the excellent sheep pasture, made it of importance in the manufacture of cloth, of which Guildford was a centre. Glass, at Chiddingfold as early as 1266, and iron were made in the Weald district, whose forests produced the necessary charcoal for smelting The ironworks of Surrey were of less importance, and much later in development than those of Kent and Sussex, owing to the want of good roads or waterways, but the increasing demand for ordnance in the 16th century led to the spread of the industry northward; the most considerable works being at Haslemere. Chilworth was famous for its powder mills in the 16th century. The earliest Delft ware manufactory in England was at Lambeth, which remains a centre of earthenware manufacture.

The total acreage under crops and grass in 1926 was 458,211, of which 74,788 ac were arable land. Oats and wheat were the chief grain crops, root crops occupied about one-third the acreage of the corn, while the area under potatoes was just over 4,000 acres. Clover and rotation grasses for hay took up 10,051 ac, and the acreage of the orchards was 1,841. The cattle are chiefly of the dairy type, the milk being sent to London, while sheep are reared on the chalk downs. A considerable area is occupied by market gardens on the alluvial soil along the banks of the Thames.

The county is chiefly residential, for those people who have business interests in London, and manufactures are not of outstanding importance. The more important are chiefly confined to London and its immediate neighbourhood They include cloth, calicoes, drugs, tobacco, etc. Communications include the naviga-

tion of the Thames and Wey, and the Basingstoke canal, communicating with the Wey from Frimley and Woking. The county is served by the Southern railway, whose lines intersect the county from north to south and from east to west. Near Croydon is the London terminal aerodrome.

Population and Administration.—The population in 1801 was 268,233, and in 1851, 683,082. In 1888, part of the county was transferred to the county of London. The area of the administrative county is now 461,833 ac., with a population (1921) of 930,086. The county contains 14 hundreds. Croydon is a county borough, and the other municipal boroughs are Godalming, Guildford, Kingston, Reigate, Richmond, Wimbledon. There are seven parliamentary divisions—Chertsey, Farnham, Mitcham, Epsom, Eastern, Reigate, Guildford; each returning one member. The borough of Croydon returns two members to parliament and the boroughs of Richmond, Kingston and Wimbledon one member each.

Guildford and Kingston are the county-towns, the assizes being held at Guildford and Croydon alternately, while the County Council sits in the County hall at Kingston. The county has one court of quarter sessions; Croydon and Guildford have separate courts of quarter sessions. The county is in the south-eastern circuit, while the central criminal court has jurisdiction over certain parishes adjacent to London. All those civil parishes within the county of Surrey, of which any part is within 12 m. of, or of which no part is more than 15 m. from, Charing Cross, are in the metropolitan police district. The county is mainly in the new diocese of Guildford, recently divided off from that of Winchester.

Walford (1878); *Archaeological Collections* (Surrey Archaeological Society; from 1858); *Victoria County History: Surrey* (4 vols.).

SURROGATE, a deputy of a bishop or an ecclesiastical judge, acting in the absence of his principal and strictly bound by the authority of the latter (Lat. *surrogare*, to substitute for). Canon 128 of the canons of 1603 lays down the qualifications necessary for the office of surrogate, and canon 123 the regulations for the appointment to the office. The office is of some importance in the United States as denoting the judge to whom the jurisdiction of the probate of wills, the grant of administration and of guardianship is confided.

SURTAX. In Great Britain and the United States, a tax imposed in pursuance of the principle of graduating the taxation of income according to the principle of "ability." The British tax originated in the "super-tax," which was first imposed in 1909. Whether named super-tax or surtax, the impost is in reality a supplementary income tax. In the British financial year 1927–8 the name "super-tax" was dropped in favour of "surtax." The surtax is assessed and collected separately from the income tax. For further details about the British and American rates of tax imposed *see* INCOME TAX: *In Practice* and SUPER-TAX.

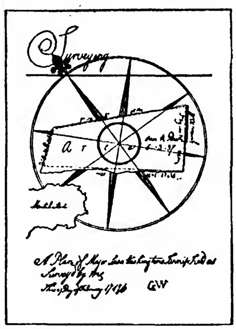
SURTEES, ROBERT SMITH (1803–1864), English novelist and sporting writer, was the second son of Anthony Surtees of Hamsterley Hall, Durham. Educated to be a solicitor, Surtees soon began to contribute to the *Sporting Magazine*, and in 1831 he published a treatise on the law relating to horses and particularly the law of warranty, entitled *The Horseman's Manual.* In the following year he helped to found the *New Sporting Magazine*, of which he was the editor for the next five years. To this periodical he contributed between 1832 and 1834 the papers which were afterwards collected and published in 1838 as *Jorrocks's Jaunts and Jollities.* This humorous narrative of the sporting experiences of a cockney grocer, which suggested the more famous *Pickwick Papers* of Charles Dickens, is the work by which Surtees is chiefly remembered, though his novel *Handley Cross*, published in 1843, in which the character of "Jorrocks" is reintroduced as a master of fox-hounds, also enjoyed a wide popularity. The former of these two books was illustrated by "Phiz" (H. K. Browne), and the latter, as well as most of Surtees's subsequent novels, by John Leech, whose pictures of "Jorrocks" are everywhere familiar and were the chief means of ensuring the lasting popularity of that humorous creation. Surtees wrote other novels, the last of which, *Mr. Facey Romford's Hounds* (1865), appeared after the author's death (March 16, 1864).

See R. S. Surtees, *Jorrocks's Jaunts and Jollities* (London, 1869), containing a biographical memoir of the author; W. P. Frith, *John Leech, His Life and Work* (2 vols., London, 1891); Samuel Halkett and J. Laing, *Dictionary of Anonymous and Pseudonymous Literature of Great Britain* (4 vols., Edinburgh, 1882–1888).

SURVEYING, the technical term for the art of determining the position of objects on the surface of the ground, for the purpose of making therefrom a graphic representation of the area surveyed. The general principles on which surveys are conducted and maps constructed from such data are in all instances the same; certain measures are made on the ground, and corresponding measures are protracted on paper on whatever scale may be a convenient fraction of the natural scale. The method of surveying varies with the magnitude of the survey, which may embrace an empire or represent a small plot of land. All surveys rest primarily on linear measurements for the direct determination of distances; but linear measurement is often supplemented by angular measurement which enables distances to be determined by principles of geometry over areas which cannot be conveniently measured directly.

History.—It is very probable that surveying had its origin in ancient Egypt. But long before the dynastic period in Egypt, we may imagine that neolithic man was able, like the savages of to-day, to make a rough kind of map based on his journeys, or a primitive plan to show tribal or property boundaries. Apart from such speculations, however, we find, in a Theban tomb of the XVIII. dynasty, a plan of the villa of a great Egyptian noble: in the tomb of one Menna at Thebes, there is a representation on the walls of two chainmen surveying a field of corn: and in Ptolemaic and Roman papyri in the same country, measurements of plots of land are described. That the early Egyptians could carry out measurements with a considerable degree of accuracy, is certain from a study of the dimensions of the Great Pyramid.

In Roman times we meet with the groma, which consists of two pairs of plumb-lines suspended from the ends of two horizontal rods, at right angles to each other: the use of the instrument being to lay out lines at right-angles. The metal parts of one of these gromas was found in 1912, in Pompeii. An early groma of the same type, but rougher construction has been found in Egypt. The Romans also used 10 foot rods, and bronze terminal pieces of such rods have been found at Enns in Austria, the foot in this case being 13·2 inches. The Romans certainly made use of an instrument not unlike the plane-table for determining the alignment of their roads. The Greeks used a form of log line for recording the distances run from point to point along the coast whilst making their slow voyage from the Indus to the Persian gulf three centuries B.C. Still earlier (as early as 1600 B.C.) it is said that the Chinese knew the value of the loadstone and possessed some form of magnetic compass. The earliest maps of which we have any record were based on inaccurate astronomical determinations; not till mediaeval times, when the Arabs made use of the astrolabe (*q.v.*), could nautical surveying really be said to begin. In 1450 the Arabs were acquainted with the use of the compass, and could make charts of the coast-line of those countries which they visited. In 1498 Vasco da Gama saw



BY COURTESY OF THE U.S. BUREAU OF RECLAMATION

A PLAN MADE BY GEORGE WASHINGTON IN 1746. INSCRIBED IN HIS OWN HANDWRITING

a chart of the coast-line of India, which was shown him by a Gujarati. Plane-tables were in use in Europe in the 16th century and the principle of graphic triangulation and intersection was practised by surveyors in England and elsewhere In 1615, Willebrord Snell, the Dutch mathematician, measured an arc of meridian, by instrumental triangulation

The Different Kinds of Surveys.—Surveys may be classed in a variety of different ways. We may describe them by their scales, as *large-scale* or *small-scale;* the large-scale surveys would be those on a scale larger than, let us say, 1.25,000 On the other hand small-scale surveys would be those on scales of 1:25,000, and smaller. Or we may describe surveys by the technical method employed. Thus we sometimes find the expressions, trigonometrical survey, compass survey, chain survey. Or surveys may be described by the purpose for which they are carried out. There are for instance, geodetic surveys, of which one of the chief objects will be the furtherance of the study of the figure of the earth and allied matters; cadastral surveys, whose purpose is to facilitate the collection of land revenue, hydrographic surveys, the purpose of which is the production of charts of the sea, for use in navigation; railway surveys, which are carried out to enable a line of railway to be economically located; and so on. Or we may describe a survey by the character of the resulting map. A topographical survey is intended to determine and depict the relative positions of the surface features of the earth, such features being either natural or artificial. A topographical map differs from a cadastral map in that the latter does not show any natural surface features which do not affect property boundaries.

Methods of Survey.—The simplest and most ancient method of making a plan or map is by means of direct measurement on the ground, with a rope, a chain, or a tape, of known length, suitably divided. As a simple illustration let us take the case of a level field of which a plan is wanted.

Suppose the field is as represented in fig. 1, the boundaries of the field being the irregular lines ABCD. Then, to survey this field with a chain or tape, put pickets at the points ABCD, somewhere near the corners of the field, these four points being intervisible and the lines between them being free from obstruction. Then measure, with the chain or tape, the direct straight-line distances, AB, BC, CA, AD, DC, BD This will provide the necessary frame-work. It will be seen that for the plotting of the frame-work, only one diagonal, that is, either AC, or BD, is required. The measurement of both gives a check on the work and shows the surveyor how much reliance he can place on his measurements; it also enables gross errors to be detected. This principle of providing checks, and of never depending upon one measurement, is of great importance. To survey the irregular boundaries, all that is necessary is to measure "offsets" from the main chain lines, at known distances along the lines, and to note these in the field book The offsets are measured with an offset rod or a tape at right-angles to the chain line. With all this information in the field book there is no difficulty in plotting the plan on paper to any scale that may be required It is usual to lay down some limit for the offsets.

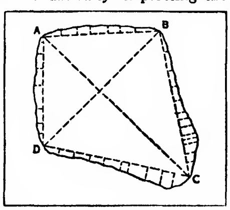


FIG. 1

An elaboration of this simple method is the scheme which was adopted by the Ordnance Survey of Great Britain and Ireland, when large-scale surveys were first commenced officially in 1825. The country was covered with a triangulation, of which the sides averaged, for the original six-inch map, some 5 miles. Each of the sides of these triangles was chained, and notes were made in the field book of points where the chain lines crossed detail, such as edges of roads, banks of streams, hedges, walls, and so on. The great triangles were broken up by other chain lines into smaller triangles, and lines tying on to these at their extremities were run along the detail to be surveyed, offsets being measured as usually.

Modern Methods.—We may now consider the system which would be adopted in a perfectly up-to-date, modern state. In such a case, there would be a geodetic survey covering the whole country with a system of triangulation of the first order; that is to say, the country would be reconnoitred beforehand, and mutually intervisible stations would be selected, some ten to thirty or forty miles apart, covering the country with a net-work, or series of chains, of triangles. At the apices of these triangles horizontal and vertical angles would be observed with a theodolite; one of the triangles would be connected with a measured side, called the base or base-line. From the known length of this side the lengths of all the other sides would be calculated. The latitude and longitude of one point in the triangulation would be determined by astronomical means, and also the true bearing of one line is obtained; it is then clearly possible to determine the latitude and longitude of every other point. The meaning of the term "first order," used above, is that the average triangular error of the net-work, or system of chains, of triangles, that is, the error of the sum of the 3 angles of a triangle, should not exceed one second.

Now we have to hang all other surveys upon this frame-work. A frame-work of the kind described has the fixed points too widely separated to be of much use for the detail survey, so the first thing to be done is to provide a closer frame-work; and this would usually be done by executing another triangulation, of less accuracy than the first, but depending upon it. There would be more points in this secondary triangulation, and the points would be distant from each other some 5 to 10 miles The triangular error would not exceed 5 seconds If now it were required to make a map on a scale of, say, 1·100,000 the frame-work would be sufficiently close, and the detail could, in suitable country, be carried out by plane-tabling which would be based upon the points so provided

But, if it were required to construct a map on a large, cadastral scale, more fixed points still would be needed, and a tertiary triangulation would be carried out, depending upon the secondary work. This tertiary triangulation would have its points only a mile or two apart, and its triangular error would not exceed 15 seconds. It is now customary to classify a triangulation according to its accuracy, thus, a triangulation of the 1st order has a triangular error not exceeding 1 second; a triangulation of the 2nd order has a triangular error not exceeding 5 seconds; a triangulation of the third order has a triangular error not exceeding 15 seconds; and one of the 4th order has a triangular error greater than 15 seconds.

But it will easily be imagined that certain areas do not readily lend themselves to triangulating, and in such areas, occasionally, *traversing* is resorted to for the frame-work This will be described later. Also, in the rapid exploration of a new country it may be necessary that the frame-work be astronomical But this is an inaccurate make-shift, and should always be avoided whenever possible.

It should be emphasized that whatever may be the extent of the area to be surveyed, whether it be a backyard or a continent, the area should be dealt with as a whole, and the frame-work should be designed to stiffen the whole area. Anyone who is charged with the execution of a survey should, therefore, carefully consider how he can best design the control or frame-work.

Bases.—The length of every side in a triangulation depends upon the length of the measured side, called the base, or base-line. Bases for geodetic work are measured with very great refinement, and the probable error of such a base would be of the order of one in one-million. Such bases in times past have been measured with glass rods, wooden rods, steel bars, and compound bars of brass and steel. But now almost every accurate base, whether for geodetic purposes, or for secondary work, or for very good topographical work, would be measured with metallic (usually invar) wires or tapes supported in catenary, *i e*, allowed to hang free in a natural curve, being slung over trestles. Invar is an alloy of steel and nickel, containing 36% of the latter, and this alloy is used because it has the smallest known expansion of any metal or alloy. Invar wires and tapes require, however, careful handling, and testing, and on this account are not freely used for rapid topographical bases. It is possible to get quite good

results from the use of ordinary steel (not invar) tapes laid along the surface of the ground.

Let us then, take the case of the measurement of a topographical base with steel tapes laid along the ground. The first thing to do is to select the site and the positions of the terminal points. These must be so chosen that well-conditioned triangles can be built up on the base, connecting it with the main points of the triangulation. (*See* fig. 2.)

Then the site must be cleared of obstructions, and small undulations levelled. Then the base terminals must be marked, and a theodolite set up over one of them and directed to a pole put up over the other. Intermediate marks, in the form of pickets driven in flush with the ground, should be fixed. The actual measurement is made with a steel tape, kept at a fixed tension with a spring balance, and marks are made on the tops of the pickets, which are at tape-lengths from centre to centre; the tops of the pickets may be conveniently covered with strips of zinc, on these strips the positions of the ends of the tape are marked when measuring. A convenient length of tape is 300 ft., with a width of $\frac{1}{8}$ inch. A convenient tension is 20 pounds. A base so measured requires corrections for standard, temperature, slope if any, and height above sea. The chief difficulty in this sort of measurement is to ascertain the temperature of the tape.

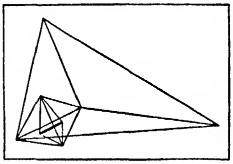

FIG. 2

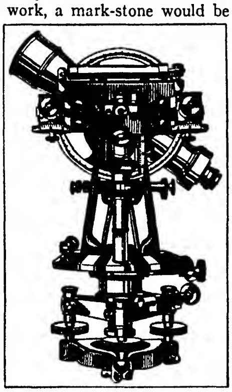
A base of this kind might be some two or three miles long; but it should be remembered that it is more important to be able to extend the base by well-conditioned triangles than to measure a long base. The base having been measured, it is now necessary to proceed with the execution of the triangulation. Fig. 2 shows the base extension, and in the case shown, the longest side reached is more than 8 times the length of the base, so that if the base were 2 miles long, the side of the main triangulation would be more than 16 m. long.

The process of triangulating consists of observing the angles at the apices of the triangles and at the two ends of the base. The apices and the ends of the base must be marked. The permanence of the marks will depend upon the character of the triangulation. Thus, in first-order work, a mark-stone would be buried deep in the soil, and isolated from the platform surrounding it. Vertically over the mark, when the observations were finished, a stone pillar would be built. In such work the signals would be luminous, either lamps or heliographs. But in work of a lower order the marks would usually be opaque; various different patterns have been used, poles, baskets, quadripods and so on. In very rapid work the tops of spires, pagodas, temples, or solitary trees are observed too; in some cases it has been found to be useful to clear a hill of all trees but one. In very rough work sometimes the tops of prominent hills are used, without any mark.



BY COURTESY OF MESSRS. COOKE, TROUGHTON AND SIMMS, LTD.
FIG. 3.—FIVE-INCH MICROMETER THEODOLITE

The angles at these trigonometrical points of whatever order, are invariably observed with a theodolite, and as this is without doubt the most important of all surveying instruments, it is desirable to give a description of it.

The Theodolite.—The theodolite is a surveying instrument consisting of two graduated circles placed at right angles to each other, for the measurement of horizontal and vertical angles, a telescope, which turns on axes mounted centrically to the circles, and an alidade for each circle, which carries two or more verniers or micrometer microscopes. The whole is supported by a pedestal resting on footscrews, which are also employed to level the instrument. The size has varied from a minimum with circles $2\frac{1}{2}$ in. in diameter to a maximum with a 36-in. horizontal and an 18-in. vertical circle, but these very large circles are now obsolete owing to improvements in dividing machines. The largest now in use is 12 in. in diameter.

As an example of a modern theodolite suitable for use in topographical or exploratory surveying, we may take a 5-inch transit theodolite, fitted with micrometer microscopes. The accompanying fig. (3) shows such an instrument by Messrs. Cooke, Troughton and Simms. The instrument rests on a tripod stand, which is not shown in the figure. The levelling base has three screws. The horizontal and vertical reading circles are 5 in. in diameter, and are each read, by two microscopes, by estimation to single seconds. The telescope, which can be completely rotated in its horizontal bearings, has a magnification of 25. The instrument packs up in two boxes for transport. Excellent work has been done with such a theodolite all over the world. It does not appear desirable to give a more elaborate description, for the use of such an instrument can only be acquired by practice.

Triangulation.—This may be carried out either in the form of chain or of a net-work (fig. 4). In a small country even the first-order triangulation might cover the land with a net-work, with sides about 30 miles long; and this was done in the case of the British Isles. But in large countries such as India or the United States a very considerable saving of time and money is effected by running chains of triangles, generally north and south, or east and west. Second order work may also be either in the form of chains or of a net-work; it would be dependent on the first order work, if that existed. Third order work, which is required by the detail surveyors, would usually cover the ground completely.

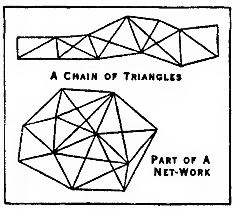


FIG. 4

At each station of the triangulation the theodolite is centred over the station mark and one of the distant stations is taken as the Referring Object and the other stations are also observed in turn. The first station should read about 0°, the base plate being so set, and then the other stations would be observed in order and the round of angles would close again on the first station. If this round were taken with the telescope to the right, the next round would be taken with the telescope to the left. The number of rounds taken will depend on the order of the work, the zero being shifted at each round, or at each alternate round. For rapid work a good system would be First zero, 0°0′, telescope right; Second zero 225° 1′ left. Telescope right is sometimes called "Face Right," and telescope left, "Face Left."

The angles having been all booked, the means are taken, and if each angle of a triangle has been observed, it is clear that the sum of the three angles should add up to 180°, plus the spherical excess, an excess which is due to the fact that the earth's surface is not plane, but is curved. Spherical excess varies directly as the area of the triangle, and may be taken to amount to 1·32 seconds for every hundred square miles, and other areas in proportion. It is generally neglected in rough work, and the excess or defect of the sum of the three angles of a triangle is, in such work, distributed equally amongst the three angles. Thus, if the sum of the three observed angles amounted to 180° 1′ 30″, each observed angle would be diminished by 30″ for use in the computations.

Computations.—Over large areas, and in work which is likely to be extended to great distances, or in which, for some special reason, the geographical positions are required, it is necessary to calculate for each trigonometrical station its latitude and longitude, starting from some station for which these elements are known. But, in the case of small or isolated surveys, such elaboration is unnecessary, and we can proceed as follows:—Take any one station as the origin, and the meridian through that station

as the initial meridian; then, having observed an azimuth, or true bearing, at the origin, we shall know the azimuth of each line which radiates from the origin Then if l_1 is the length of one of these lines, and if α is the angle which it makes with the initial meridian, then $l_1 \cos\alpha$ is the north-south co-ordinate, and $l_1 \sin\alpha$ is the east-west co-ordinate of the end of that line. For lines radiating from the end of the line in question, if β be the angle that one of them makes with a line parallel to the initial meridian, then if l_2 be the length of this second line, the co-ordinates of the end of it with reference to the beginning will be $l_2 \cos\beta$ and $l_2 \sin\beta$, so that the co-ordinates of any point in the triangulation, with reference to the origin, will be $l_1 \cos\alpha + l_2 \cos\beta + l_3 \cos\gamma + \ldots$, and $l_1 \sin\alpha + l_2 \sin\beta + l_3 \sin\gamma + \ldots$. Each point in the triangulation can now be plotted with reference to the origin and the initial meridian, due regard being paid to the signs of the trigonometrical functions. With these co-ordinates available it is, of course, easy to compute the distance of any one point in the triangulation from any other point.

In using this simple method, we have assumed that the earth's surface is plane; actually it is a spheroidal surface. The errors involved are chiefly in a north-south direction. At sixty miles' distance from the origin the error amounts to $\frac{1}{8,800}$, and the error increases as the square of the distance, so that at 100 miles the error is $\frac{1}{8,100}$ and if we were content with this error as a maximum, we could survey 200 miles on this system.

Heights.—Points fixed as above described, and plotted on paper at intervals of, say, four or five inches, give a sufficient control for the horizontal work of the detail surveyor; but he will also require a frame-work of heights if he is to contour, or approximately contour, the terrain. Heights may be determined in a variety of ways and with several degrees of accuracy, the most accurate method, and at the same time, the slowest and most expensive, is levelling, which will be dealt with later. The next method in order of accuracy is trigonometrical determination by vertical angles, taken with a theodolite, and this will now be briefly described. On the same day that the horizontal angles are observed at a trigonometrical station, vertical angles are observed to all the distant marks, and are read on the vertical circle of the theodolite It has been found by experience that vertical refraction is least during the middle of the day, and vertical angles would, therefore, be taken between noon and three. It is best to eliminate refraction as far as possible by observing vertical angles at each of the two stations of which the difference of height is required Then it is easily shown that, if one angle is an elevation, E_a and the angle at the other station is a depression, D_b, then the difference of height is $c \tan \frac{E_a + D_b}{2}$; or if both are depressions,—which may often happen with long rays,—the difference of height is $c \tan \frac{D_b - D_a}{2}$, c being the distance between the two stations If only one angle has been observed, it will be necessary to correct this for refraction and curvature; the average amount of this correction may be taken as roughly about 4½ seconds for every thousand feet of horizontal distance between the stations, and for other distances in proportion. Barometers are best used for determining differences of height, and not absolute heights All heights should, when possible, be based on some determination of mean sea-level, which is now the universally accepted datum.

Levelling.—A "Level" is an optical surveying instrument, which, when in adjustment, has its line of collimation horizontal; that is, the intersection of the cross-wires will cut an object, seen through the telescope, on the same horizontal plane as the optical axis. In using a level there is no need to consider the curvature of the earth, because the distances between the level and the forward and back level-staves are always kept short; in good work such a distance should not exceed 50 yards. If the distances in question are always kept approximately equal, any error due to faulty collimation will tend to disappear. Excellent modern levels are now made which enable the observer to read the bubble without moving from the object end of the telescope, and the instrument is finally levelled before the reading is taken. Readings are taken on two staves, usually some ten feet long; each staff graduated in feet and tenths of feet, and hundredths may be estimated.

TOPOGRAPHICAL SURVEYS

The British empire affords examples of all possible methods of the survey for, and preparation of, topographical maps

Great Britain itself is one of the few countries in which all mapping is combined under one department and in which the expense of duplicating surveys for different purposes is avoided The six-inch plans are used in the field for a special revision, arranged to secure the correct information for small scale maps The small scale maps are then drawn for reproduction by helio-zincography, each scale serving as a basis for the next in order.

Canada supplies excellent examples of topographical mapping and particularly so in photographic method The one inch maps of areas in the Rocky mountains are made by ground photographic methods A control of triangulated points is first established. The photographic party is equipped with theodolites and cameras which fit upon the same stands. The cameras are so used that each portion of the ground to be mapped is photographed from two points of view on plates held in the vertical plane The position of the camera is resected with the theodolite. The plotting is carried out during the winter recess, each photographic view being used as a record of angular measurement both horizontal and vertical. Positions are established by the intersections of rays.

The survey of the Orange Free State in the Dominion of South Africa is an example of a plane table survey in country admirably suited to its use The total area of over 50,000 square miles was mapped in 6 years by a Colonial Survey Section of 2 officers and 4 non-commissioned officers, R E. There already existed, in parts of the area, chains of the Geodetic Survey of South Africa. Based on this triangulation, the officers of the party extended a ruling triangulation of a secondary nature (mean triangular error of less than 3 seconds). The sides of this triangulation varied from 10 to 45 miles A tertiary triangulation, completed with a free use of intersection and interpolation, resulted in a fixed position and height every 4 or 5 miles Plane tabling was carried out at the scale of $\frac{1}{125\,000}$ each field sheet including 15 minutes of latitude and longitude. Progress averaged six or seven square miles per man per diem.

An example of a different class of survey in much more difficult country is to be found in the forest regions of the Gold Coast and Sierra Leone. There is little triangulation available, nor would it be possible without heavy expense The control, mainly astronomical and widely spaced, is provided by a special party equipped with theodolite and wireless receiving set. The detail party traverses along cleared paths with chain and compass between control points. The triangles are then cut up by a number of rope and sound traverses. Along the main traverses lines of rough levelling are run, and aneroid barometers are carried on the minor traverses Field work is at the two-inch scale and each traverse is adjusted and compiled on a final compilation.

Plane Tabling.—The plane table is merely a flat board which can be attached to a tripod The board varies in dimensions from 40 in. to 18 in a side, a convenient size being 24×18 inches The board itself is generally made of wood, sometimes fitted with aluminium corners and fittings Underneath, the board is strapped with metal, and has in the centre a ring with arrangements for attachment to the tripod. The tripod, of three girder pattern legs of light wood, can be clamped to the board or left friction tight to allow of rotation. Plane tables designed for large scale surveying often include a ball and socket joint for levelling, and an instrumental slow motion in azimuth. For topographical survey the board and legs are left as simple and light as possible. On the table is mounted drawing paper or some form of celluloid.

The principal accessory to the plane table is the sight vane or alidade, which is merely a ruler with sighting vanes which can be raised or lowered at will. For engineering surveys at a largish scale a telescope with stadia hairs and vertical circle is added to the alidade A box compass and some form of clinometer for measuring slopes or vertical angles complete the outfit

The first step in the field is to set the board. To do so it is

only necessary to set a line a.b. on the board parallel to A.B. on the ground. The alidade is laid on the line a.b. and—standing at A.—the planetabler revolves his board until he sees B. through the sight vanes. Lines can then be drawn from a. towards any other points on the landscape. Similar lines from b. intersecting those from a. will then fix the positions. This intersection is an important factor in plane tabling. Even though the topographer may be given many control points fixed by the theodolite, he must amplify that control for the detail surveying he has to do. As a general rule then intersection is used today in providing the minor control for tomorrow. The actual mapping is based mainly on the process known as interpolation, resection, or "making the point." This is simply to find, from the positions of three or more control points, the position at which the table is set up. There are several methods of resection, the simplest of which will be described briefly:

The board is roughly set and rays are drawn backwards from three control points towards the observer; the alidade being aligned on each in turn, so that it touches its plotted position. If the board has been truly set these rays will all pass through a point. If not, the true position of the observer will be nearest to the ray from the nearest point, furthest from the ray from the most distant. Again if the three control points lie round and outside the observer his position will be within the triangle of error. If the observer is outside his points his position is outside the triangle of error.

At each point so fixed the topographer sketches in the detail immediately around him, on directions drawn along the alidade, and at distances which are measured tachymetrically or by pacing or estimation. Heights are fixed by observing angles of elevation or depression and multiplying their tangents by the distances.

In average country a topographer will survey a square mile or so per diem on the one inch scale, but his rate will depend greatly upon his transport. Even at such scales as 3 inches to the mile, where the amount of detail to be shown demands intensive surveying rather than fast movement, a bicycle or some other transport is advisable.

The scales suitable for plane tabling lie between a quarter inch and three inches to the mile. At larger scales the plane table may still be and often is used, but more as a record of instrumental measurement and less purely graphically.

Traversing.—A traverse consists of measured lengths connected by measured angles. A traverse may end upon itself forming a complete figure, in which case it is called a closed traverse. More commonly it starts from one point of the triangulation and ends upon another. In cities, forests, or other areas of little visibility, the whole control may consist of a net-work of traverses.

The lengths or "legs" of the traverse may be measured in many ways. In control traversing invar or steel tapes are used in catenary (as in base measurement) or laid flat; in both cases under tension. For topographical surveying legs are measured with tapes or chains, ropes or rattans, by cyclometer or by pacing. They may also be measured optically with rangefinder, telemeter, subtense bar, or tachymeter. In geographical surveying, distances may be determined by observed differences of latitude on observed azimuths, or estimated from the time taken to travel over them on foot, horse, camel or motor car. Any class of precision may in fact be obtained, varying in fractional error from $\frac{1}{200,000}$ to $\frac{1}{50}$.

The angles of a traverse may be measured with theodolite or compass, may be obtained graphically on the plane table, or estimated from the direction of a sound, generally in the form of a prearranged call or whistle from a forward observer.

In the topographical survey of a new country various classes of traversing may occur. In the Federated Malay States and in West African Colonies, precise traverses with a linear error of about $\frac{1}{50,000}$ have been used as a framework or control. In the actual detail survey of forest regions minor traverses fill up the gaps between more precise and costly control traverses and afford opportunity of plotting detail. Examples of Topographical Traverses which will explain the procedure are given below.

In a recent three inch to one mile survey in Johore, the trigonometrical control consisted of a number of points assumed as errorless. Between them were run traverses with the compass and chain. The course of the traverse was cut as straight as possible. The observer plotted his bearings and lengths on squared paper at 6 inches to the mile, including the mapping of detail and contours. On reaching the closing point the traverse was adjusted graphically to its correct length, reduced to 3 inches to the mile and plotted on the plane table. Errors were, in general, of the order of $\frac{1}{500}$. The triangle of traverses was then cut up by minor traverses running straight and parallel at 200 feet intervals. These traverses were compass and "rattan" (a long creeper, marked to length, and compared each day with a standard chain). The detail and contours were mapped during the course of the traverse which was plotted direct on the plane table and seldom showed need of adjustment.

As explained above traverses which are graphic in principle are adjusted graphically and proportionally. In adjusting instrumental (or booked) traverses the normal rule is to adjust as follows:—

As the arithmetical sum of all x's (or y's) is to any one x (or y), so is the whole error in x's (or y's) to the correction to the corresponding x (or y).

An adjustment on these lines gives equal weight to angular and linear measurement and admits the fact that there is, in general, no evidence on which to give preference among (*i.e.*, to *weight*) the measurements.

OPTICAL METHODS OF MEASURING DISTANCES

The optical methods of distance measurement which are here dealt with are those which depend upon the measurement of a length from a small base at one end and the angle subtended by that base at the other. They include a number of alternatives. For example the base may be fixed or variable, the subtended angle variable or fixed. The base may be at the observer's end or the far end, may be vertical or horizontal, whilst the angle may be measured by hairs or lines in the focal plane, by a micrometer scale in the focal plane, by repetition measurement on the horizontal arc, or by optical devices actually included in the base apparatus. The earliest form development took was in the use of fixed stadia hairs in the focal plane, reading, according to distance, a variable length on a vertical graduated staff. This method was later called tachymetry, or tacheometry (quick measurement) by the Italian Porro.

Tacheometry or tachymetry was first outlined and applied by the English astronomer Gascoigne in 1639. Montanari, a Venetian doctor, constructed and used an instrument of similar principle in 1674. James Watt used it for surveying in the West of Scotland from 1771 onwards, and William Green, a London optician, did much to develop the method by the publication of a description in 1778. (*Description and use of an improved Reflecting and Refracting Telescope and Scales for Surveying.*) The unequal effect of refraction on the top and bottom lines of sight was understood by Green who called attention to the advantage of a horizontal, as opposed to a vertical, angular measurement. Nevertheless the practical convenience of the vertical staff has made it the most popular. Methods in which the base is variable but horizontal, that is a horizontal tachymetry, are sometimes known by the term telemetry. Methods in which the base is fixed (and generally horizontal) and angles read on the theodolite arcs are known as subtense, whilst the fixed base which includes its own system of angular measurement is commonly called rangefinding. The use of the various terms is, however, and must be, elastic.

Tachymetry.—A tachymeter (or tacheometer), in its simplest form, is only a theodolite, or telescopic alidade, provided with two horizontal wires fixed in the diaphragm at equal distances from the axis. These wires, read against a vertical graduated staff at the distant point, measure an intercept "a." The distance between the wires is so arranged that the required length "s" is some fixed multiple "k" of "a" (k usually = 100) although certain corrections may have to be applied.

The theodolite still most commonly used has a biconvex object glass and an eyepiece, and it can be shown that the point at which the subtended angle is constant lies not on the vertical axis but at a distance in front equal to f+c, where f is the focal

length at stellar focus, and c is the distance of the centre of the object glass to the diaphragm,

$$\text{then } s = k.\ a + (f + c).$$

(k if not known must be determined by experiment)

Used in this general form for many years, the inconvenience of the constant computation of (f+c) has led to the use of an "anallatic," or converging, lens between the object glass and the

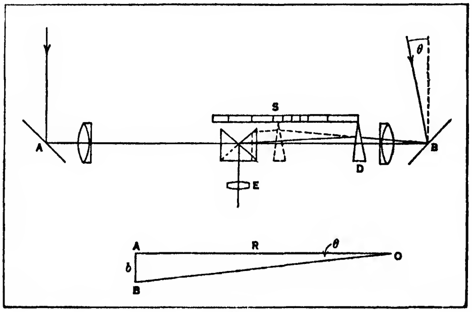

FIG. 5

diaphragm Due to the Italian Porro the introduction of this lens makes it possible to measure lengths directly from the station as defined by the vertical axis of the instrument. To an increasing extent the internal focussing telescope, translating for focussing, is now replacing the older style, and in it the point of measurement is so close to the vertical axis as to result in consequent errors of an order inferior to many others which are unavoidable. (*See* bibliography—Henrici.)

The general equation thus becomes $s = k\,a$.

The length "s" is however the actual distance between instrument and staff, whereas surveying demands the horizontal and vertical components, and the computation of these will depend on the way in which the staff is held. Normally the staff is held vertical Let θ be the angle of elevation, or depression, to the centre of the intercept a. Let d be the horizontal component and h the vertical component. Now the image of a will be reduced, obviously, to equal $a\cos\theta$, and

$$s = ka\cos\theta\text{—}$$
$$\text{but } d = s\cos\theta.$$
$$\text{Therefore } d = ka\cos^2\theta$$
$$\text{and } h = \pm d\tan\theta, \text{ or } \tfrac{1}{2}\, ka\sin 2\theta.$$

The rod may however be held perpendicular to the optical axis. Where this is intended the staff is equipped with a device which allows the rodman to sight on the instrument In this case if l be the length from the foot of the stave to its intersection with the produced optical axis—(the sighting point)

$$\text{then } s = ka\cos\theta \pm \sin\theta$$
$$\text{and } d = \pm Ra\sin\theta \mp l\cos\theta.$$

In the course of a normal tachymetric survey a very large number of points are generally fixed and the trigonometrical computation becomes irksome. There are numerous tables designed to facilitate this computation, and there are also special instrumental fittings for the same purpose. Some continental forms of tachymeter solve the triangle by scaled bars which actually form the triangle whose sides are s, d and h. The Beaman arc is a fitting used often in America. This arc is fitted against the vertical arc of the tachymeter but is independent of it and can be set to any zero It has two scales which help in the solution of $\cos\theta$ and of $\frac{1}{2}\sin 2\theta$. Some recent models give a direct reading of the horizontal and vertical components. It may be said, generally, that the tachymeter should not be used for distances of over 600 feet, that errors increase proportionally to the distance (except in the case of refraction which acts as the square of the distance) and that they may be expected to reach at least one part in four hundred.

Tachymetry is a medium scale method and is particularly suitable to engineering surveys, above or below ground. It is used perhaps more than any other for continental topographical surveys at scales of $\frac{1}{20{,}000}$ or $\frac{1}{25{,}000}$ but is unsuitable alike for the 25 inch mapping of the United Kingdom or the small scale mapping of the Empire overseas. Used on the plane table the tachymeter is useful for traversing in difficult enclosed country or, where the control points can be seen, for measuring distances and heights to points that are immediately round the point of resection

Telemetry.—The very marked effect of refraction upon the precision of tachymetry has led to the use of staves in the horizontal position. The need for greater precision seems to have been felt particularly desirable for the distance between the cameras used in ground photo surveying.

Subtense methods are much used in topographical and military surveys. In such cases a theodolite is usually available and a subtense bar or base can be rapidly improvised The bar or base is arranged horizontal so that the line between stations is perpendicular to it either at its centre point or at one end The angle is measured by "repetition" on the slow motion screws of upper and lower plates. Thus, sighting on the left hand mark, the telescope is revolved with the top plate slow motion screw to point at the right hand mark. The bottom plate screw is then used to repoint on the left hand mark and the process continued until some 10 to 20 readings have been made The whole angle is then read and divided by the number of times the measurement has been made The general equation is

$$d = \frac{b}{2}\cot\frac{a}{2} \text{ if the perpendicular is to centre point}$$

or

$$d = b \cot a \text{ if the perpendicular is to end point.}$$

Where d is the horizontal distance, b is the length of bar or base, and a the subtended angle.

The subtense base may be of any convenient size Sometimes signals have been erected as ends of a subtense base of as much as a quarter of a mile in length the distance between being taped. But subtense bars of special design, 10–20 ft long, are the commonest form of base. The end marks are often discs with black lines on a white ground For distances up to 500 yards using a 10-foot subtense bar, with disc terminals, errors of the order of $\frac{1}{500}$ may be expected, but with proper precaution, good end marks, and sufficient repetition, a much higher order of precision may be obtained. The advantages of these subtense methods over tachymetry lie in their greater range and precision, in the ease with which the base can be improvised, in the freedom from either a special instrument or a special staff of rodmen, and in the direct measurement of the horizontal distance

Rangefinders.—Some rangefinders are stereoscopic in principle and resemble, in that respect, the stereoscopic plotting machines with their "floating mark" Coincidence methods have the great advantage over stereoscopic that almost everyone can use them. Moreover for this particular purpose a general plastic image is not required. Errors involved in the use of the rangefinder, for any given base and magnification, are proportional to the square of the distance and an error of $\frac{1}{500}$ may be taken as normal at a range of 250 yards with a 31·5 inch (8 cm) magnification 8 model Models reach 100 feet in base length and 28 in magnification With a 1 metre base and magnification 20 the fractional error is less than $\frac{1}{500}$ at 500 yards. An increasing survey use is being made of this rangefinder. In Canada, Egypt and elsewhere surveyors are finding its advantage over the tachymeter in the independence of rodmen and the increased speed. In Canada it has been, and is, used in the control of river and lake traverses on which the surveys, nowadays mainly air photo-surveys, of the northern territories are based. Obviously the rangefinder would prove useful in medium scale plane tabling for the measurement round each resected point.

Contouring.—The first step in contouring is to measure or choose the datum to which the height of all points shall be re-

ferred. It is now common to accept mean sea-level, as measured and meaned over a long period of time at same tide gauge. With reference to this datum a control of heights is distributed over the country by spirit levelling or by vertical angles measured with the theodolite.

Geodetic levelling would not be available, normally, as a backbone or control for a topographical survey. For this latter purpose secondary levelling with errors not exceeding about 0·03 foot per mile would suffice. These secondary chains, spaced fifty to a hundred miles apart in a grid or net, are generally confined to railways or roads. The intervals would then be filled up with subsidiary orders of levels reaching eventually such errors as 0·1 foot per mile over short lengths. Levels of a topographical class are often run with the tachymeter in conjunction with plane tabling.

In topographical surveys of new countries it is usual to base contouring on a control of heights determined trigonometrically (by vertical angles with a theodolite). The operations of triangulation and determination of heights are thus combined. Truly simultaneous observation between two points will tend to eliminate refraction. In all other cases there is bound to be uncertainty. Observation of vertical angles should be confined to the times of minimum refraction (early in the afternoon), and heights should be carried forward through the shortest sides—since the correction for refraction varies as the square of the distance. Trigonometrical heights show errors of the order of two or three feet in 100 miles.

In plane-table surveys minor heights are obtained with the Indian pattern clinometer, a small instrument which reads slopes, vertical angles, and natural tangents of the vertical angles. The clinometer (nine inches long) has two vanes. In the rear vane is a sight hole which can be levelled in relation to the zero point of the front vane. If confined to a radius of two miles this clinometer gives excellent results, but at longer ranges errors rapidly increase.

The increasing use of the aneroid barometer is due to the convenience of measuring height directly instead of deducing it from distance and slope. A barometer measures the pressure of the air however and before it can be used to measure either absolute or relative heights corrections must be applied to eliminate the effect of (a) Weather, diurnal, and area variations, (b) Temperature, (c) Index or other instrumental errors.

The first correction is usually applied by comparing the record of a barometer retained in camp with that of the field instrument. The second can be applied directly if the shade temperature is measured at the time of each reading, but thermometer readings must also be taken for the stationary or camp instrument. Under particularly stable conditions it is possible to record the movement due to average diurnal variations and to dispense with the camp instrument, the recording of which is often difficult to arrange. In these cases the record graphs should be either corrected for variation in temperature or amplified by a statement of the mean temperature at definite time intervals. There is much to be done still in designing survey barometers with an eye to reducing instrumental errors such as lag, friction of pivots, etc.

The hypsometer (or boiling point apparatus) is of more value to the explorer than the surveyor.

In topographical surveying contours are not generally followed out in detail, but are sketched in upon the control. Strict accuracy in contouring is not perhaps a very important feature of a topographical map. Topographical scales will not show, in any case, enough information for engineering enterprise, whereas a relatively good and reliable picture of the accidents of the ground is of the first order of importance in the development of a new country. The sketching in of the contours is helped by measuring gradients, by noting all points in the observer's level and by spacing contours properly on rivers and streams. There is little difficulty in attaining sensible accuracy in the position of contours in hilly country, but errors of four or five feet in altitude are normal and may be appreciable in flat country.

The vertical interval between contours depends principally upon the scale of the map, although it is also conditioned by the type of country. Thus the same vertical interval could hardly be applied to Switzerland and to Flanders. A good idea as to the proper interval in feet for average country will be obtained by dividing 50 by the scale in inches to the mile. Thus a map on the scale of ½ inch to one mile would have contours at 100 feet intervals.

Field Sheets.—As explained in the article on plane tabling the board is covered with paper, canvas backed, or mounted previously on a thin sheet of aluminium. Some form of celluloid is also used on occasion. This covering is called the Field Sheet. On it are plotted the control and the boundary lines of the individual task, and on it the plane tabler subsequently maps. A plane tabler should be "within his points." The area of his work should then be substantially less than that of the board itself in order to allow of plotting control points in the margins, which are also wanted for notes and lists of names. On the other hand, a plane tabler starts a new field sheet slowly and gathers pace as he gets to know his control and his country. A good mean figure for the area of work on a board of 18×24 in. is from 60 to 80 sq. inches.

The plane tabler's area should be bounded by definite, ruled-in lines. It sometimes happens that a river or other topographical obstacle makes it imperative for neighbouring topographers on either side to work to this natural and therefore irregular line, but the accuracy of subsequent adjustment suffers. The dividing line should be one across which roads, rivers and other details pass naturally. An overlap between well trained plane tablers is neither necessary nor advisable, nor is it necessary for them to meet at any stage of their work. The correct conventional signs and colours will have been laid down in advance and each plane tabler will ink in his work as and when he considers it final. No colour which is not photographically opaque should be used. It is not generally advisable to map at scales larger than the final map. The plane tabler judges more accurately the amount of generalisation necessary if his field sheet is plotted at the map scale and as names are generally written in the margin, there is ample space available in which to show all the required detail.

On conclusion of the survey, the field sheet will be available for checking. Every party should have some proportion of its strength earmarked for revision. After, or during, revision the edges common to the finished field sheets should be compared. Differences on the edges should be small, but occasional errors in orientation ("swing") may arise if there has been difficulty in seeing the control points. Differences should be traced backwards to the nearest resections and for this reason resected points and their heights should be left in pencil on the field sheet until comparisons are finished.

SURVEYING FROM AIR PHOTOGRAPHS

A photograph is a perspective view of the ground it represents. In certain cases, though rarely, the ground surface is truly parallel to the plane of the photographic plate. In this case the photograph is a correct plan. Any other relationship of ground (or map) and photographic plane results in a true perspective plan so long as the surface to be mapped is flat, the angle between the two planes being known as the tilt. In this case the map can be wholly reconstructed on perspective lines.

The general case differs from either of the above in that the surface to be mapped is rarely flat, presenting the three ordinary dimensions of nature, whilst, as in the second case, the photographic plane is inclined or tilted to the map plane. There are then two difficulties to surmount, the perspective effect and that of difference of altitude. These two effects act from different points on the plane of the photograph. It is one of the hardest problems of surveying from air photographs to disentangle these two effects and to correct them in the proper way. The photograph is a central perspective of the ground mapped, which is true in so far as lens, shutter, photographic material, temperature changes and rigidity of the camera allow. The perspective centre is the point on, or with reference to, the plate from which directions to points on the ground correspond to those from the camera. Height, however, introduces in the perspective view distortions which radiate from a point in the plane of the photograph verti-

cally below the front nodal point of the lens This point is commonly known as the Photo Plumb Point. The perspective centre and photo plumb point coincide with each other, and with the optical centre, when the two planes (ground and photo) are parallel In all other cases these three points are distinct from each other and lie on a line perpendicular to the axis of tilt at distances which are functions of the tilt

As nearly all photographic surveying demands a knowledge of the position of these points the first step is so to calibrate and to adjust the camera that the optical centre corresponds to the principal point (the point at which a perpendicular from the front nodal point meets the plane of the photo). Fiducial marks photographed on the four edges of the plate can then be joined up to give the correct position. It is with reference to this position that the perspective centre and photo plumb point can be found The principal distance (between the lens and the principal point) must also be measured. In the remainder of this article it will be assumed that the camera has been properly calibrated and adjusted

The Single Photograph in Perspective. (a) *Where the Ground is Flat.*—If S is the representative fraction of the scale, L be a distance on the ground, and l the corresponding distance on the photograph, then for any given small area $S=\frac{l}{L}$. But l is conditioned by the tilt and the scale varies accordingly. Where photographs are taken as nearly as possible with a vertical axis then $S=\frac{f}{H}$ where f is the principal distance (not quite the same thing as the focal length), and H is the height of flight. Whether or not photographs are nearly vertical the problem is the same because it has not been found possible hitherto to maintain the axis truly vertical, to record such deviations from the vertical as may occur, or to keep a constant height. In

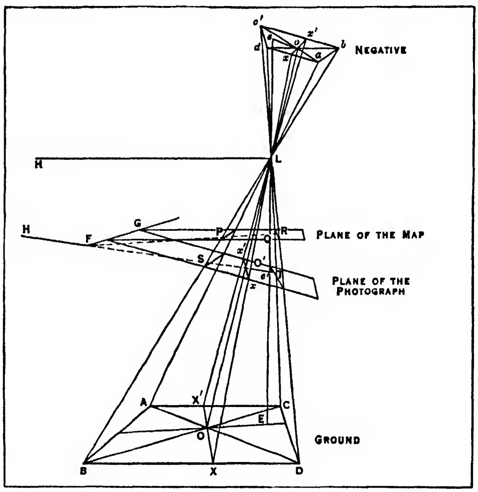

FIG 6

every case then the photograph is a perspective view at an unknown tilt and from an unknown height The effect of tilt can be eliminated by perspective treatment founded on the corresponding positions (on ground and photograph) of four points Such treatment may be either graphic or photographic and is generally called rectification.

Graphic methods are seldom applied to the whole photograph. In practice it is easy to find straight lines through points clear on the photograph, and already mapped, which will intersect on, or sufficiently close to, the new point which is to be added. Perspective figures may also be used. If the lines or subdivisions of the perspective figures are sufficiently close, detail may be copied by eye, correcting both for tilt and for scale in the process.

Photographic rectification is more suitable for larger areas if these are really flat. It must be remembered however that a sharp image is essential to good plotting and that the ordinary projecting lantern, though it offers freedom of movement for the screen, does not do so for the photograph. This latter movement is, however, necessary to secure a sharp image. Space forbids a further analysis of the perspective and optical principles involved. (*See* bibliography.) For small scale or exploratory mapping it may be convenient to assume that photography has been vertical and the height has been constant. Mosaics (composite pictures made up of "vertical" photographs) are made on this assumption, although where good maps already exist, mosaics are usually built up on positions taken from them.

Examples of Surveys on the Above Lines: i The Topographical Survey of Canada has made excellent quarter inch maps of the lake and river areas of the Laurentian Plateau from highly tilted oblique photographs in which the horizon appears, and serves the purpose of two of the four necessary control points

ii. The swamps and forests of the Irrawaddy Delta were mapped by the Survey of India from "verticals" controlled by triangulation and traverse. Individual photographs were not rectified but strips of photographs were prepared and rephotographed to the correct scale as given by the control.

iii. The Air Survey of Flanders and Picardy in 1916–17 was based on a fresh triangulation, on which an old but fairly reliable cadastral survey was assembled Fresh detail, inclusive of trenches and other military works, was added from vertical air photographs, each of which was treated as a perspective view within the narrow limits of the cadastral control.

(b) *In Ordinary Country and for Contoured Maps*—In the bundle of rays which converge to the camera that from the top of a high chimney or hill (unless it be vertically under the camera) will make a larger angle with the vertical than will the ray from the point directly under that chimney or hill top Heights are thus displaced outwards from the plumb point, depressions inwards. The only perspective effect which holds good is that of direction from the perspective centre.

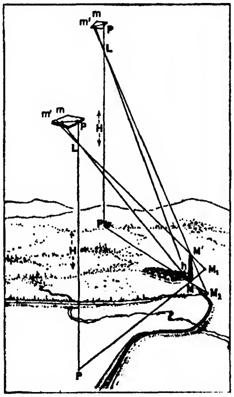
In ground photo topography the position, height and tilt of the camera are known In air photo topography none of these are known, but they can be found from the corresponding positions on ground and photograph of four points properly surveyed in plan and in height

The reconstruction may be graphical, mathematical or mechanical. Graphical methods are not sufficiently precise, whilst a mathematical solution, possible in several ways, is excessively lengthy. The mechanical solution is that adopted in the machines for stereoscopic measurement which will be mentioned later. All three suffer from the difficulty of securing suitable well defined and sharp images on the plate. Precision of measurement on the plate is therefore difficult to attain whilst the comparatively small area of the base (the area included by the four control points), and the comparatively sharp angles at the apex, are difficulties

Pairs of Photographs.—A pair exposed from different air stations and covering a common portion of ground gives two directions to each point in the area common to the two photographs. The positions and heights of the points can therefore be completely determined so long as the constants of exposure are known

The stereoscopic machines for surveying from ground stations act on this general principle but the problem they solve is comparatively easy because the positions of the ground stations can be surveyed directly and the photographs can be taken at measured angles of tilt and in a definite angular relationship to each other. Air stations cannot be surveyed directly Reference must be made from the images on the plates to the points of a ground control, which those images portray, before the stereoscopic image can be plotted on the plane of the map (*e.g.*, mean sea-level), properly oriented, and reduced or enlarged to the appropriate scale This reference to ground control can be carried out in two ways. Firstly, as in those stereoscopic machines which

follow the general lines of their predecessors designed for ground stereo plotting, each photograph is set, singly, upon a control of four points surveyed on the ground, thus reconstructing the position and tilt of the plate in space. When both plates of the pair have been thus placed a final joint setting ensures proper correspondence. The process of setting may take several hours. There is however another way which is to set the pair in correspondence, in space, before referring to the ground control. The pair is said to be in correspondence when corresponding directions in space intersect, each pair of points being in correspondence when the rays to them intersect. A perfect correspondence between plates is secured when five points are in correspondence and the plates are then set in their correct relative positions to each other and to the base line between the two air stations. This is the principle of the Fourcade stereogoniometer. The strip so set or plotted is, however, not on the required plane nor is it necessarily correct in scale and orientation. To secure correct plan the whole must be referred to a ground control which, however, may be comparatively open. We must know—



BY COURTESY OF THE CONTROLLER, H. M. STATIONERY OFFICE

FIG. 7.—DISPLACEMENT OF PHOTOGRAPH DUE TO HEIGHT OF FEATURE

(a) Scale—This is determined from a measured base on the ground by comparison with the corresponding length in the stereoscopic image.

(b) The position of a horizontal plane in the stereoscopic image which can be determined from a comparison of two vertical angles measured on the ground with the corresponding angles on the stereoscopic image measured in relation to an approximate position of the horizontal which can afterwards be corrected.

The data so obtained set the machine for

(a) The length of the air base.

(b) The angle through which both photographs must be rotated about the air base, in order to re-establish the vertical plane containing the air base.

(c) The inclination of the air base to the horizontal.

However the plates of a pair have been set, detail on the relief or stereoscopic image from a pair of set photographs is plotted by the superimposition of the image formed by a pair of artificial "floating marks" which combine stereoscopically to produce that image at a known position in space. The movement of the image relative to the landscape enables the latter to be measured and surveyed in detail. For convenience however in mechanical and optical construction it is usual for the "floating mark" to be fixed and the stereoscopic image of the landscape to be moved. Maps so produced have been mainly cadastral and engineering plans at a large scale. Meanwhile for topographical work at smaller scales methods have been evolved which depend upon the elimination, by good and consistent flying, of any excessive tilt. For all classes of air survey it is most important that navigation in the aeroplane should aim at maintaining an undeviating course both as to direction and height.

Methods for securing straight flight and constant height have not yet been standardised. As a rule each pilot has evolved his own methods for himself. Great skill is often displayed but variations of wind may well cause displacements of track of half a mile in a ten-mile strip. Deviations of 80 to 100 ft. in height are common. This problem, which can only be solved by a judicious mixture of instrumental control and training, remains one of the most important to surmount. If the tilt is small the perspective centre and the photo plumb point approach each other and the principal point. It is possible then to assume that directions from the principal point may hold good both as regards tilt distortion and height distortion. Methods based on this assumption are known as radial methods. The first assumption made is that the air base of any pair is defined in direction by the line joining the photographic images of the two principal points. It would not be possible however to accept as relatively correct on the ground the successive distances measured on the photographs between principal points. It is usual in these methods to allow for an overlap large enough to include the two air bases (forwards and backwards) from the centre of each individual photograph. The positions of the fore and back stations can thus be found by a comparison of detail, but such tilt and height distortion as may occur on the lines between them are sufficient to introduce serious errors of length.

The scale of the plot is, therefore, obtained by accepting an arbitrary length on the first photograph and by continually fixing points in the overlaps and refixing the principal points from them thus:—The base 1–2 on the first photograph is set along any line which will be convenient for subsequent plotting. A line 1a is now drawn to a (on the photograph, image of A on ground) and is accepted as an arbitrary length on the "plot." The second photograph is now set on line 2–1 and moved along it till the direction from 2 to A cuts the position a on photograph 1. Thus the distance 1a is made the base for all subsequent work. From 1 and 2 directions are drawn to b and c (images of B and C) which appear on both photographs. As these also appear on the third photograph which is set on the direction 2–3 (between principal points 2 and 3) the position of 3 (principal point of the 3rd photograph) can be resected.

Naturally the construction lines must be drawn on tracing paper, linen or celluloid (the latter is most convenient), the photographs being placed separately and successively under it. Once the positions of the principal points have been plotted all other points of detail may be fixed by the intersection of the photographic directions. A particular development of the radial method, commonly known as the Arundel method, employs a small "topographical" stereoscope in these first stages of plotting. The particular feature is the addition over each photograph of glass plates on which are etched diamond shaped grids. These grids fuze stereoscopically into a plane which may be moved vertically in relation to the landscape, for contouring, and which are also used to show when the pair is properly in correspondence. By this method the orientation of the air base can be established and marked on each photograph. Contouring in the Arundel method is carried out on alternate photographs. Each pair is set and examined in the topographical stereoscope on the assumption that they are untilted and exposed from the same altitude. The resulting stereoscopic image is naturally subject to errors in apparent slopes, the effect of which must be held in check by a fairly close height control. The plane formed by the diamond grids may be made to touch the ground at any place, the extent of movement being recorded on scales. Other heights may then be interpolated and when a sufficient control has been secured contours can be drawn in by eye on the actual photograph. They are subsequently traced in correct position on the celluloid plot.

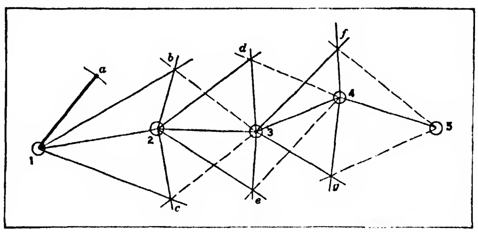


FIG. 8

MAP REPRODUCTION

The general heading of reproduction covers the various processes of drawing, photography and printing, which come between

the survey on the ground and the completed map. There is a stage generally carried out by draughtsmen called compilation, which, however, antedates fair drawing and is equivalent to survey. Small scale maps of the less well known parts of the world are made up from material of various sorts and generally of unequal value.

The next stage is fair drawing. The draughtsman's first task is to plot the graticule and margin of his sheet on the chosen projection He then plots the control points in proper position and begins to incorporate his material. Whether the latter is compilation, or field sheet, it is probable that the photographer will be called upon to provide bromides at the required scale The next point to decide is the number of colours to employ. If the whole map is drawn on one sheet of paper the photographer will have to divide colour from colour during his preparation of the zinc plates. If each colour is drawn separately then subsequent photography and zincography is made easier, but the fit of one colour upon another, commonly known as the register, will suffer; for, once embarked upon, the various different drawings may expand or contract unequally. The procedure chosen is often a mixture of these two principles.

Sometimes the field sheets are assembled and photographed to be printed in blue and to act as a direct key to the drawing of various colours. Blue is chosen because, in the subsequent photography of the completely drawn colour sheet or plate, blue will not appear on the negative, which will record nothing which has not been inked in. This system is handy, and guards against bad register. The use of a complete key of this sort implies that the whole of the material can be collected and photographed into position at one and the same time In other cases each main colour is drawn on its own tracing paper, the various plates being compared and examined, over each other, at frequent intervals, to prevent the clash or overprinting of the different colours. In all such drawing the colours used must be photographically opaque Where main colours are treated separately each is drawn in black. Where all the colours are drawn together a difference must be made as a guide to subsequent separation but the colours employed need not be those of the final map

The main photographic process of preparing the printed record from the finished drawing is heliozincography. In this process the original drawing is photographed, and the glass negative is then laid over a sensitized zinc plate. The negative and zinc are held in close contact in a frame from which the air can be pumped Light penetrates the lines and names left clear on the negative and hardens the surface below. The remainder of the sensitized surface, protected by the negative, remains soft and can be washed away.

In the heliozincographic process each plate is photographed to the proper dimensions. The great advantage of heliozincography lies, however, in the possibilities of touching up or adding fresh detail actually on the negative. A special staff is employed in large map establishments for this purpose If all the colours of the final map have been drawn together it is at this stage that separation occurs. As many negatives are made as there are to be main colours. On each negative everything irrelevant to the particular colour in view is duffed out. The glass negatives then become the final records, from which any number of printing plates may be made.

The zinc plates are now given over to the printers (*See* LITHOGRAPHY.)

"SURVILLE, CLOTILDE DE," the supposed author of the *Poésies de Clotilde.* The generally accepted legend gave the following account of her. Marguerite Éléonore Clotilde de Vallon Challis, dame de Surville, was born in the early years of the 15th century at Vallon. In 1421 she married Bérenger de Surville, who was killed at the siege of Orleans in 1428 Her husband's absence at the war inspired her heroic verses and his death her elegiac poems. The last of her poems is a *chant royal* addressed to Charles VIII. In 1803 Charles Vanderbourg published as the *Poésies de Clotilde* some forty poems dealing with love and war. Research showed that the documents, communicated by the marquis de Surville to Vanderbourg were not genuine, and the account of Clotilde herself was proved to be inaccurate

Mazon, *Marguerite Chalis et la légende de Clotilde de Surville* (1875); articles by Gaston Paris in the *Revue critique d'histoire et de littérature* (March 1, 1873 and May 30, 1874), by Paul Cottin in the *Bulletin du bibliophile* (1894); E K. Chambers, *Literary Forgeries* (1891); and further references in the *Bibliographie des femmes célèbres* (Turin and Paris, 1892, etc.)

SURVIVAL: *see* PSYCHICAL RESEARCH

SUS, a province of southern Morocco. It is an east-to-west valley, 200 km. long, bounded by the Atlantic ocean, High Atlas, Siroua and Anti-Atlas. The area is about 20,000 sq. kilometres Sus has a Saharan climate slightly mitigated by its nearness to the Atlantic The arganier (*Argania sideroxylon*) is the characteristic tree; it has the appearance of a spiny olive, and forms sparse forest-steppes The waters of the Wad Sus and its affluents allow of some cultivation, helped by irrigation, but one must not exaggerate the agricultural wealth of the region; it is reputed to be rich in mines, especially of copper The population is about 400,000, grouped at the foot of the mountains and along the Wad; it is Berber in race and speech, and belongs to the Chleuh group The Susis emigrate willingly and are excellent workmen The port of Sus is Agadir, the Santa-Cruz of Cape Aguer of the Portuguese; situated on the Atlantic to the north of the mouth of the Wad Sus, it includes a citadel and a fishing village; a harbour is being built. Tarudant, capital of Sus, is a native town of 6,000 inhabitants, of whom 1,000 are Jews

SUSA (Shúshan, Sús), capital of Susiana (Elam) and chief residence of Darius I and his successors It lay under the Zagros range at about lat. 32°, near the bank of the Karkha (Choaspes) river and close to the Kárún (For early history *see* ELAM)

The site, identified (1850) by W. K Loftus, has on it four mounds One, rising about 38 metres, holds the citadel A second to the east represents the palace of Darius I and was excavated by M Dieulafoy. The enamelled bricks taken from its walls are in the Louvre. A third mound to the south contains the royal Elamite city, while the fourth mound consists of the poorer houses Excavation of the citadel was begun by J de Morgan in 1897 It yielded the obelisk of Manistusu (*see* BABYLONIA), the stele of Naram-Sin, and the Code of Hammurabi (the latter in the winter of 1901–02).

The finest pottery came in the lowest strata, 25 metres below the surface, and belongs to two different civilizations both in the Neolithic period The earlier is characterized by vases of fine red clay, wheel-made, in a few well-defined shapes, but all with very thin, polished sides. The decorations applied in black paint or red-brown ferruginous earth consist of bold geometrical patterns, often combined with spirited studies from nature. The pottery of the second period shows a retrogression, being coarser and porous.

Above the early strata come remains of Elamite and early Babylonian civilization, inscribed objects from the latter bearing pictorial characters from which the cuneiform was evolved. The upper portions of the mounds disclosed inscribed Achaemenian monuments, Greek pottery and inscriptions of the 4th century B.C., coins of the kings of Elymais, and Parthian and Sassanian relics. Muslim tradition says that the tomb of the prophet Daniel

lay in the bed of the Karkha river and a mosque was built on the bank opposite the supposed spot. Until after the 14th century the city was a flourishing centre of a district famous for silk, sugar-cane and oranges. It is now deserted.

SUSA (Fr. *Sousse*), a city of Tunisia, on the Gulf of Hammamet, in 35° 49′ N., 10° 39′ E., 36m. by rail E. by N. of Kairawan, of which it is the port, and 93m. S. by E. by rail of Tunis. Susa is built on the side of a hill sloping seawards, and is surrounded by a crenellated wall, strengthened by towers. The kasbah, or citadel, built on the highest point within the town, was thoroughly restored by the French after their occupation of the country in 1881, and serves as military headquarters for the district. The native town has been little changed since the French occupation, but north of the port a European quarter has been created. The museum contains many archaeological treasures, notable mosaics and sculptures. The most interesting buildings in the old town are the Kasr-er-Ribat and the Kahwat-el-Kubba. The Kasr-er-Ribat is a square fortress with a high tower and seven bastions. The Kahwat-el-Kubba (Café of the Dome) is a curious house, square at the base, then cylindrical, and surmounted by a fluted dome. The grand mosque is in the north-east part of the town. To the south-west of the town there are vast Christian catacombs, excavated by the Abbé Leynaud in 1904, which contained some 10,000 burials. The ancient harbours are silted up, but vestiges of the Roman breakwaters may be seen. The modern port, completed in 1901, enables steamers drawing 21ft. to lie at the quays. Exports are chiefly phosphates and other minerals, olive oil, esparto and cereals; imports: cotton goods, building material, etc. The population, less than 10,000 at the time of the French occupation, now reaches 21,298, of which 10,714 are Muslim, 3,728 Jews, 6,856 Europeans (3,664 French, 2,437 Italians, 563 Maltese).

SUSARION, Greek comic poet, a native of Tripodiscus in Megaris. About 580 B.C. he transplanted the Megarian comedy into the Attic deme of Icaria, the cradle also of Greek tragedy and the oldest seat of the worship of Dionysus. According to the Parian Chronicle, there appears to have been a competition on this occasion, in which the prize was a basket of figs and an amphora of wine.

See V. von Wilamowitz-Möllendorf (*Hermes*, ix.), who doubts the whole story; the lines *s.n.* Susarion in Meineke, *Comic Fragments*, are probably spurious.

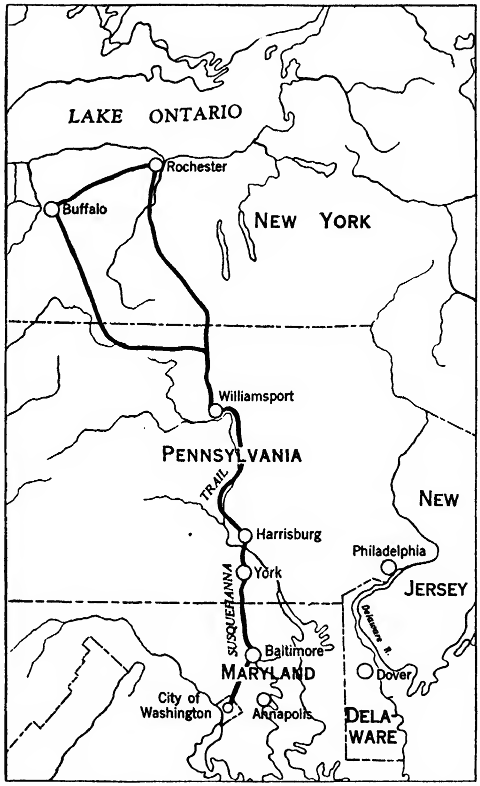
SUSO [Seuse], **HEINRICH** (*c.* 1300–1366), German mystic, was born at Überlingen on Lake Constance; he assumed the name of his mother, his father being a Herr von Berg. He was educated for the Church, first at Constance, then at Cologne, where he came under the influence of the greatest of the German mystics, Meister Eckart. He subsequently entered a monastery in Constance, where he subjected himself to the severest ordeals of asceticism. In 1335 he wandered through Swabia as a preacher, and won all hearts by his gentle, persuasive eloquence; the effusive lyricism of his language made him an especial favourite among the nuns. About 1348 he seems to have settled in Ulm, where he died on Jan. 25, 1366. Suso's first work, *Das Büchlein der Wahrheit,* was written in Cologne about 1329; setting out from Eckart's doctrines, he presents the mystic faith from its speculative or theoretical side; whereas in *Das Büchlein der ewigen Weisheit,* written some years later in Constance, he discusses the practical aspects of mysticism. The latter work, which Suso also translated into Latin under the title of *Horologium sapientiae,* has been called the finest fruit of German mysticism.

Suso's works were collected as early as 1482 and again in 1512; recent editions: *Heinrich Suso's Leben und Schriften,* ed. by M. Diepenbrock (1829; 4th ed., 1884); *Suso's Deutsche Schriften,* by F. H. S. Denifle (1878–1880, not completed), and *Deutsche Schriften,* by K. Bihlmeyer (2 vols., 1907). *See* also W. Preger, *Die Briefe Heinrich Susos* (1867); W. Preger, *Geschichte der deutschen Mystik* (1882), vol. ii.; J. Jäger, *Heinrich Seuse aus Schwaben* (1894); and *The Life of Blessed H. Suso, by Himself* (1913), trans. by T. F. Knox, with introd. by W. R. Inge.

SUSPENSION BRIDGE: *see* Bridges.

SUSPENSURA, the architectural term given by Vitruvius (v. 10) to the hollow space under the floor of a Roman bath, in which the smoke from the furnace passed to the vertical flues in the wall. (*See* Hypocaust.)

SUSQUEHANNA TRAIL, an American highway from Williamsport, Pa., to Harrisburg, Pa. It connects at either terminal with paved or hard surfaced roads and furnishes a picturesque route connecting Buffalo and Rochester, N.Y. with Baltimore, Frederick, Md. and Washington, D.C. It passes through farming districts in New York and Pennsylvania, crosses the Appalachian mountains and traverses the Gettysburg battle-field.



SUSSEX, EARLS OF. G. E. Cokayne (*Complete Peerage*, i. 138, 139) holds that Roger de Montgomery, who received grants from William the Conqueror of a large part of the county of Sussex, including the city of Chichester and the castle and honour of Arundel, besides lands in Shropshire with the castles of Shrewsbury and Montgomery, may be regarded as the first earl of Sussex. Whatever Roger's titles may have been, they were forfeited to the Crown when his son Robert was attainted in 1102, and the forfeited estates were conferred by Henry I. on his second wife Adelicia, who after Henry's death married William de Albini, or d'Aubigny. The latter was created earl of Sussex by King Stephen, and "the third penny" of that county was confirmed to him by an instrument of the reign of Henry II., in which, however,

he is styled earl of Arundel, a designation by which he was more generally known. His grandson William, 3rd earl of Sussex, was one of King John's sureties for the observance of Magna Carta; and in 1243, the earldom reverted to the Crown on the death of Hugh de Albini, 5th earl of the line (*See* ARUNDEL, EARLS OF)

Ratclyffe Earls.—For nearly two hundred years, from 1347 to 1529, the title of earl of Sussex did not exist in the English peerage. In 1529, however, it was conferred on Robert Radcliffe, Radclyffe or Ratclyffe (*c* 1483–1542), who had been made Viscount Fitzwalter in 1525. In 1540 Ratclyffe was appointed great chamberlain of England With Edward, the 6th earl (*c.* 1552–1641), the title became extinct

Savile Earls.—In 1644 Thomas Savile (*c.* 1590–*c* 1659), son of John Savile, 1st Baron Savile of Pontefract (1566–1630), was created earl of Sussex. Savile opposed Wentworth, afterwards earl of Strafford, the rivalry between the Saviles and the Wentworths being of long standing in the history of Yorkshire. During the Great Rebellion he played a double game, and was imprisoned at different times by both parties. His later years were spent in retirement at Howley Hall, where he died about 1659. He was succeeded in the earldom of Sussex by his son James, on whose death without issue in 1671 the title became extinct.

It was revived in 1684 in favour of Thomas Lennard, 15th Baron Dacre, whose wife Ann (d 1722) was a daughter of the famous duchess of Cleveland by King Charles II, and again became extinct at this nobleman's death in 1715 The title was next conferred in 1717 on Talbot Yelverton, 2nd Viscount de Longueville and 16th Baron Grey de Ruthyn (*c.* 1692–1731), from whom it descended to his two sons successively, becoming once more extinct on the death of the younger of these, Henry, 3rd earl of Sussex of this creation, in 1799

Royal Earls.—In 1801 Prince Augustus Frederick (1773–1843), the sixth son of George III, was created duke of Sussex. Spending his early years abroad, the prince was married in Rome in 1793 to Lady Augusta (d 1830) daughter of John Murray, 4th earl of Dunmore The ceremony was repeated in London and two children were born, but under the Royal Marriage Act of 1772 the Court of Arches declared the union illegal The children took the name of d'Este. Sussex was a man of liberal ideas; he favoured the abolition of the slave trade, the repeal of the corn laws and the removal of the civil disabilities of Roman Catholics, Dissenters and Jews His second wife, Cecilia, widow of Sir George Buggin, was created duchess of Inverness in 1840 He died at Kensington Palace on April 21, 1843 The older title of earl of Sussex was conferred in 1874 upon Prince Albert, the third son of Queen Victoria, who at the same time was created duke of Connaught and Strathearn

See G. E. C, *Complete Peerage, s v* "Sussex," "Surrey," "Arundel," vols i. and vii. (London, 1887–96); Sir William Dugdale, *The Baronage of England* (1675) For the earls of the Radcliffe family *see* also John Strype, *Memorials of Thomas Cranmer* (1694), *Annals of the Reformation* (1725) and *Ecclesiastical Memorials* (3 vols, 1721), P F Tytler, *England under the Reigns of Edward VI. and Mary* (2 vols, 1839); *Calendars of State Papers: Letters and Papers of the Reign of Henry VIII.* For the 1st earl of the Savile line *see* S R Gardiner, *Hist. of England, 1603–1642* (10 vols, 1883–84) and *Hist of the Great Civil War* (3 vols, 1886–91); and John Rushworth, *Historical Collections* (8 vols., 1659–1701).

SUSSEX, THOMAS RADCLYFFE [or RATCLYFFE], 3RD EARL OF (*c* 1525–1583), lord-lieutenant of Ireland, eldest son of Henry, 2nd earl of Sussex (*see* SUSSEX, EARLS OF), by his first wife, Elizabeth, daughter of Thomas Howard, 2nd duke of Norfolk, was born about 1525, and after his father's succession to the earldom in 1542 was styled Viscount Fitzwalter. After serving in the army abroad, he was employed in 1551 in negotiating a marriage between Edward VI and a daughter of Henry II., king of France. His prominence in the kingdom was shown by his inclusion among the signatories to the letters patent of June 16, 1553, settling the crown on Lady Jane Grey; but he nevertheless won favour with Queen Mary, who employed him in arranging her marriage with Philip of Spain, and who raised him to the peerage as Baron Fitzwalter in August 1553 In April 1556, Fitzwalter was appointed lord deputy of Ireland. The measures enjoined upon Fitzwalter by the government in London comprised the reversal of the partial attempts that had been made during the short reign of Edward VI. to promote Protestantism in Ireland, and the "plantation" by English settlers of that part of the country then known as Offaly and Leix But Fitzwalter first of all found it necessary to make an expedition into Ulster. Having defeated O'Neill and his allies the MacDonnells, the lord deputy, who by the death of his father in February 1557 became earl of Sussex, returned to Dublin, where he summoned a parliament in June of that year Sussex then took the field against Donough O'Conor, whom he failed to capture, and afterwards against Shane O'Neill, whose lands in Tyrone he ravaged, restoring to their nominal rights the earl of Tyrone and his reputed son Matthew O'Neill, baron of Dungannon. (*See* O'NEILL.) In June of the following year Sussex turned his attention to the west, where the head of the O'Briens had ousted his nephew Conor O'Brien, earl of Thomond, from his possessions, and refused to pay allegiance to the Crown; he forced Limerick to open its gates to him, restored Thomond, and proclaimed The O'Brien a traitor. He took part in the ceremonial of Queen Elizabeth's coronation in January 1559; and in the following July he returned to Ireland with a fresh commission, now as lord lieutenant, from the new queen, whose policy required him to come to terms if possible with the troublesome leaders of the O'Neills and the MacDonnells. Sussex was recalled, at his own request, in 1564. His government of Ireland had not, however, been without fruit. Sussex was the first representative of the English Crown who enforced authority to any considerable extent beyond the limits of the Pale.

On his return to England, Sussex immediately threw himself into opposition to the earl of Leicester. In 1566 and the following year Elizabeth employed him in negotiations for a marriage with the archduke Charles When this project fell to the ground Sussex returned from Vienna to London in March 1568, and in July he was appointed lord president of the north, in which office he had to deal with the rebellion of the earls of Northumberland and Westmorland in 1569 In 1570 he laid waste the border, invaded Scotland, and raided the country round Dumfries, reducing the rebel leaders to complete submission In July 1572 Sussex became lord chamberlain, and he was henceforth in frequent attendance on Queen Elizabeth, both in her progresses through the country and at court, until his death on June 9, 1583

The earl of Sussex was a patron of literature and of the drama. He was twice married. first to Elizabeth, daughter of Thomas Wriothesley, earl of Southampton; and secondly to Frances, daughter of Sir William Sidney. His second wife was the foundress of Sidney Sussex College at Cambridge, which she endowed by her will The earl left no children, and at his death his titles passed to his brother Henry

Tytler, *England under the Reigns of Edward VI. and Mary* (2 vols, 1839), Richard Bagwell, *Ireland under the Tudors* (3 vols, 1885–90), *Calendar of the Carew MSS.;* John Stow, *Annales* (1631); Charles Henry Cooper, *Athenae cantabrigienses,* vol i. (Cambridge, 1858), containing a biography of the earl of Sussex; John Strype, *Ecclesiastical Memorials* (Oxford, 1822); Sir Cuthbert Sharpe, *Memorials of the Rebellion of 1569* (1840), John Nichols, *Progresses and Public Processions of Queen Elizabeth* (3 vols, 1823); Sir William Dugdale, *The Baronage of England* (1675).

SUSSEX, a southern county of England, bounded north by Surrey, north-east by Kent, south by the English Channel, and west by Hampshire. The area is 1,459·2 sq miles The county consists of the central and southern portion of the broad east to west dome of the Wealden anticline, and is very long (78 m) in proportion to its breadth (28 m. at broadest). The dominant feature is the chalk of the South Downs (average height 500 ft., Ditchling Beacon 800 ft.) which cross the county in a west-north-west to east-south-east direction, ending in bold cliffs at Beachy Head Westward from this point the chalk forms the south coast, except that at Seaford there are outliers of Reading beds and from South Lancing onwards the same beds extend as a thin belt into Hampshire, there to form the Hampshire basin This belt lies a few miles from the coast, except south of Chichester, where it broadens out and forms the low flat headland of Selsey Bill. East from Beachy Head, Wealden clay and Hastings beds form the coast, but recent deposits round Winchelsea and Rye (members of the Cinque Ports and prominent in

mediaeval trade) and Pevensey have cut these towns off from the sea. The South Downs dip gently southward, but form a steep escarpment to the north, where the upper formations of the anticline have been denuded, exposing in succession from south to north, gault and upper greensand, lower greensand, Wealden clay and Hastings beds, with small patches of Purbeck shale, and limestone with beds of gypsum lying west of Battle. The gault and upper greensand form a plain at the foot of the escarpment, bounded north by the elevated ridge of the lower greensand, beyond which the Wealden clay and Hastings beds give rise to hill country known as the Forest Ridges (800 ft. near Crowborough), where rise many Sussex rivers. Of these, the Rother forms part of the Kent boundary and enters the sea below Rye; the Cuckmere rises near Heathfield (where also natural gas is found in the Lower, Wealden and Purbeck beds); the Ouse, the Adur and the Arun rise in the district of St. Leonard's forest, flow south and breach the chalk, having respectively as gap towns, Lewes, Steyning and Arundel, and as ports, Newhaven, Shoreham and Littlehampton.

The country north of the Downs was formerly covered with forest, but much wood was cut for export to the Low Countries as early as the 14th century, and for the Wealden iron industry, especially in the 17th and 18th centuries. The coast line of Sussex is long and exceedingly varied, and encroachment and erosion have taken place as well as accumulation. Old Winchelsea was submerged in the 13th century; the site of the ancient cathedral of Selsey is a mile out at sea; 5,500 ac. were submerged between 1292 and 1340; early in the 14th century, Pagham harbour was formed by the sudden flooding of 2,700 ac., since reclaimed. The latest movement of the coast is probably one of slight elevation. The following changes have taken place at river mouths:—Prior to a great storm on Oct. 12, 1250, the Rother entered the sea 12 m. to the east; until 1570, the outlet of the Ouse was at Seaford; the Adur has frequently shifted its mouth. Submerged forests occur offshore. The sheltered coast has given rise to many watering-places:—Brighton, Hastings, Eastbourne, Bexhill, Seaford, Shoreham, Worthing, Littlehampton, Bognor.

History.—Sussex, with its long southern shore, supplying fish and salt, and dissected by mouths of clear rivers, with gravel-lined valleys leading to sunny chalk slopes, was admirably suited to the needs of primitive man, and we have definite traces of him in Palaeolithic times, on the coast, *e.g.*, near Worthing, Eastbourne, Brighton and Chichester, and in the valleys, especially of the Arun and western Rother. In Neolithic times these and similar sites were very important, as kitchen middens, tools, bones of animals, etc., abundantly prove. The Downs were also used. The flint mines of Cissbury are now generally ascribed to a late Neolithic date, though some students have dated them back to earlier times. The Bronze age finds (pottery, celts, etc.) show that the coastal regions (Worthing, Wilmington, Eastbourne, where gold bracelets, bronze swords, copper, etc., were found) were again used. The importance of Sussex continued, and the Iron age finds, though less numerous, show a high degree of culture, the gold ornaments from Mountfield being especially important. Objects of Sussex iron (hammer, plough-share, bill-hook, etc.) found at Mount Caburn, point to an iron industry in pre-Roman times. The Long Man of Wilmington cut in the chalk is probably also of this period. That agriculture was practised by prehistoric man is also proved by the presence of numerous lynchets and rectangular fields still traceable on the chalk slopes. Mr. Toms, of Brighton, has gathered evidence to show that the great earthwork at Cissbury is probably of British workmanship in the Roman period, and there are numerous other earthworks in Sussex of early Iron age or Romano-British date. Cissbury and Chanctonbury are in a "Worthing" group, while the Devil's Dyke and many others are in a Brighton group. Mount Caburn and several others are also well known.

In 447 the Saxons, under Ella and his three sons, built up the kingdom of the South Saxons. (*See* SUSSEX, KINGDOM OF.) They took the Roman city of Regnum (Chichester) and drove the British westward, into the forest of Andred. The Roman fortress of Anderida (Pevensey), also fell to the Saxons. According to Bede, Ella was the first Bretwalda. After his time the kingdom of Sussex gradually declined and fell under the dominion of Wessex in 823. Saxon remains are found in numerous cemeteries, and scattered burial places along the south slopes of the Downs. The cemetery on High Down hill, where weapons, ornaments and vessels of various kinds were found, and the Chanctonbury hoard of coins, are noteworthy. A coin of Offa of Mercia, found at Beddingham, recalls the charter of Archbishop Wilfred in 825, in which Offa's connection with the monastery in that place is recorded. From 895 Sussex suffered from constant raids by the Danes, till the accession of Canute, after which arose the two great forces of the house of Godwine and of the Normans. Godwine was probably a native of Sussex, and by the end of the Confessor's reign a third part of the county was in the hands of his family. Norman influence was strong in Sussex before the Conquest; the harbours of Hastings, Rye, Winchelsea and Steyning being in the power of the Norman abbey of Fécamp.

Hastings and Pevensey were important under the Normans, being on the most direct route for Normandy. William secured communication with London by placing the lands in the hands of such men as his half-brother, the count of Mortain, who held Pevensey, and his son-in-law, William de Warenne, who held Lewes. With the exception of lands held by the Church and the Crown, the five rapes of Sussex were held by these and three other Norman tenants-in-chief: William de Braose, the count of Eu, and Roger, earl of Montgomery, who held respectively Bramber, Hastings and Arundel. The honour of Battle was afterwards made into a rape by the Conqueror, and provides one of the arguments in favour of the theory of the Norman origin of these unique divisions of the county. The county was divided into five (afterwards six) strips, running north and south, and having each a town of military, commercial and maritime importance. These were the rapes, and each had its sheriff, in addition to the sheriff of the whole county. Whether the origin of the rapes, as districts, is to be found in the Icelandic territorial division *hreppr* (rejected in the *New English Dictionary*), or in the Saxon *rap*, a rope, or is of Norman origin, as lordships they owed their existence to the Normans. The holdings—which had been scattered under the Saxons, so that one man's holding might be in more than one rape—were now determined, not by the manors in which they lay, but by the borders of the rape. Another peculiarity of the division of land in Sussex is that, apparently, each hide of land had eight instead of the usual four virgates.

The county boundary was long and somewhat indeterminate on the north, owing to the dense forest of Andredsweald, which was uninhabited till the 11th century. Evidence of this is seen in Domesday Book by the survey of Worth and Lodsworth under Surrey, and also by the fact that as late as 1834 the present parishes of North and South Amersham in Sussex were part of Hampshire. At the time of Domesday Sussex contained 60 hundreds, since become 73. These courts were in the hands, either of the Church, or of great lords. The county court was held at Lewes and Shoreham until the Great Inquest, when it was moved to Chichester. After several changes the act of 1504 arranged for it to be held alternately at Lewes and Chichester.

The chief ecclesiastical franchises were those of the archbishop of Canterbury, of the bishop of Chichester, of the Saxon foundation of Bosham, and of the votive abbey of Battle, founded by the Conqueror. This abbey possessed, besides land in many other counties, the "Lowy of Battle," a district extending for 3 m. round the abbey. The see of Chichester was co-extensive with the county, and has altered little. It is one of the oldest bishoprics, having been founded by Wilfred at Selsey; the seat was removed to Chichester by William I.

Sussex was constantly the scene of invasions and rebellions, Pevensey and Arundel playing a great part in the latter under the early Norman kings. In the barons' wars the county was a centre for the king's forces, Lewes being in the hands of the king's brother-in-law, John de Warenne, earl of Surrey, Pevensey and Hastings in those of his uncle, Peter of Savoy. The forces of the king and of De Montfort met at Lewes, where the famous

battle and "Mise of Lewes" took place. Corrupt administration during the 13th and 14th centuries, constant passage of troops for the French wars and the devastating plagues of the 14th century, were the causes of such rebellions as the Peasants' Rising (1381) and Jack Cade's Rebellion (1450). During Elizabeth's reign there was constant levying of troops for Flanders and the Low Countries, and preparations for defence against Spain. The sympathies of the county were divided during the Civil War, Arundel and Chichester being held for the king, Lewes and the Cinque Ports for the parliament. Chichester and Arundel were besieged by Waller, and the Roundheads gained a strong hold on the county, in spite of the loyalty of Sir Edward Ford, sheriff of Sussex. A Royalist gathering in the west of the county in 1645 caused preparations for resistance at Chichester. In the same year the "Clubmen" rose and tried to force terms. During the French Revolution, Sussex produced many volunteers At the outbreak of war with France (1793) a camp was formed at Brighton and at Eastbourne (1803) when the famous Martello towers were erected.

In 1290 we have the first extant return of knights of the shire. Drastic reformation was effected by the Redistribution Act of 1832, when Bramber, East Grinstead, Seaford, Steyning and Winchelsea were disfranchised after returning two members each, the first being classed among the worst of the "rotten" boroughs. Before 1832 two members each had been returned also by Arundel, Chichester, Hastings, Horsham, Lewes, Midhurst, New Shoreham (with the rape of Bramber) and Rye. Arundel, Horsham, Midhurst and Rye were each deprived of a member in 1832, Chichester and Lewes in 1867, and Hastings in 1885 Arundel was disfranchised in 1868, and Chichester, Horsham, Midhurst, New Shoreham and Rye in 1885 In the 18th century the duke of Newcastle was all-powerful in the county, where the Pelham family had been settled from the time of Edward I, the earl of Chichester being the present representative of the family.

Architecture.—Sussex is rich in ancient castles. Lewes and Bramber are in ruins, but Arundel is still the seat of the dukes of Norfolk. More famous than these are the massive remains (part Norman, mainly 13th century), of Pevensey, within the walls of Roman Anderida. Other ruins are those of the finely situated Hastings Castle; the Norman remains at Knepp near West Grinstead; the remarkably perfect moated fortress of Bodiam (14th century); and Hurstmonceaux Castle (15th-century brick).

Monastic remains are few The ruins of Bayham Abbey near Tunbridge Wells, and of Battle Abbey, may be noticed There are numerous churches of great interest and beauty. Of these may be mentioned the cathedral of Chichester, the churches of Shoreham and Rye, and the mother church of Worthing at Broadwater Construction of pre-Norman date is seen in the churches of Bosham, Sompting and, most notably, Worth There is very rich Norman work of various dates in the church of St. Nicholas, Steyning Several perfect specimens of small Early English churches are found, as at West Tarring, and at Climping, near Littlehampton. Perhaps the most interesting church in the county is the magnificent Decorated fragment at Winchelsea; another noteworthy church of this period is at Etchingham, near the eastern border. The church of St. Denis, Midhurst, is mainly Perpendicular; the large church at Fletching contains the tomb of Gibbon the historian At Cowfold, south-east of Horsham, is a great Carthusian monastery, founded in 1877.

Dialect.—A large number of Saxon words are retained and pronounced in the old style; thus *gate* becomes *ge-at*. The letter *a* is very broad in all words, as if followed by *u*, and in fact converts words of one syllable into words of two, as *faüs* (face), *taust* (taste), etc. Again, *a* before double *d* becomes *ar*, as *arder* and *larder* for *adder* and *ladder; oi* is like a long *i*, as *spile* (spoil), *intment* (ointment); an *e* is substituted for *a* in such words as *rag, flag*, etc The French refugees in the 16th and 17th centuries introduced many words which are still in use.

Climate and Agriculture.—The climate is mild and equable. The average annual rainfall varies from 22·5 in. (Pevensey levels) to over 40 in (west end of the Downs) The temperature varies from 61°–63° F, July, to 39°–40° F, January. The soil is fertile and a large proportion is under cultivation. Sussex is still one of the best wooded counties in England; oaks are typical of the Weald and the beech of the lighter chalk lands. The Weald, the Downs and the salt marshes provide different types of pasture. Weald farms often possess marsh pastures, and transhumance takes place between the two Many cattle are raised, especially in east Sussex, and are sent from the Weald to fatten on the marshes in April and May. Sheep (Southdown and Kent) are very important, and lambs raised on the eastern marshes are often sent to the Weald to winter. The south slopes of the Downs and the coastal plain at their feet, west of Shoreham, form an early region for lambs, with good arable on which both sheep and lambs can be fattened, the latter for early markets. Sheep-rearing has given rise to important fairs.—St John's and Findon (early July); the Bat and Ball fair at Chiddingly (end of July); Lindfield, near Hayward's Heath (early August); Findon, 2nd fair (early September); Lewes, the most important fair of the year (Sept. 21). Large sales are also held, notably at Chichester, in August. Dairying is becoming increasingly important Shorthorns and Jerseys (for butter) are the chief breeds Fruit and hops are important crops on the heavy lands of East Sussex; root-crops (including sugar beet, the output of which has much increased) and grain (wheat and oats) are grown in both, but especially in West Sussex Milk, poultry, early fruit and flowers are increasingly supplied to London and other markets

Industries.—The industries, though now mostly limited to minor ones connected with agriculture (brewing, tanning, etc), were formerly very varied. The furnaces for the Wealden iron industry, which dates back probably to pre-Roman times, were chiefly in Sussex Clay gave rise to pottery and brick-making Glass-making (with fine Hastings sand) flourished at Chiddingfold (Surrey), and at Westborough Green, Loxwood and Petworth in Sussex Weaving and fulling were also carried on, Chichester being noted for its cloth The shores abound in shellfish, and both fresh-water and sea fishing are very important; the herring-fisheries and the salt-pans on the coast are noted in Domesday

Communications.—The Southern railway runs from London to Hastings, St. Leonards, Bexhill, Eastbourne, to Lewes and Newhaven, to Brighton, to Shoreham, and to Arundel, Chichester and Selsey, with numerous branches and a connecting line along the coast There are no good harbours, and none of the ports is of first importance From Newhaven, however, a large trade is carried on with France, and daily passenger steamers ply to Dieppe.

Population and Administration.—The area of the ancient county is 932,471 ac, with a population (1921) of 727,997. The earliest statement as to the population is made by Bede, who describes the county as containing in the year 681 land of 7,000 families; allowing ten to a family (not an unreasonable estimate at that date), the total population would be 70,000 In 1693 the county is stated to have contained 21,537 houses If seven were allowed to a house at that date, the total population would be 150,759 It is curious, therefore, to observe that in 1801 the population was only 159,311 The decline of the Sussex iron works probably accounts for the small increase of population during several centuries, although after the massacre of St. Bartholomew upwards of 1,500 Huguenots landed at Rye, and in 1685, after the revocation of the Edict of Nantes, other refugees arrived

An act of Henry VII (1504) directed that for convenience the county court should be held at Lewes as well as at Chichester, and this apparently gave rise to the division of Sussex into east and west parts, each of which is an administrative county. East Sussex has an area of 530,555 ac, and West Sussex 401,916 acres Sussex includes the parliamentary borough of Brighton and the county boroughs of Hastings and Eastbourne. East Sussex contains the municipal boroughs of Bexhill, Lewes and Rye. In West Sussex the municipal boroughs are Arundel, Chichester (a city), and Worthing The ancient county, which is almost entirely in the diocese of Chichester, contains 377 ecclesiastical parishes or districts, wholly or in part. The total number of civil parishes is 338. Sussex is divided into the following parliamentary divisions: northern or East Grinstead, eastern or Rye, southern or East-

bourne, mid or Lewes, south-western or Chichester, north-western or Horsham and Worthing each returning one member; and contains the parliamentary boroughs of Brighton, returning two members, and Hastings, returning one.

SUSSEX, KINGDOM OF (*Súð Seaxe, i.e.,* the South Saxons), one of the kingdoms of Anglo-Saxon Britain, the boundaries of which coincided in general with those of the modern county of Sussex. According to the tradition given in the Anglo-Saxon Chronicle, it was in 477 that a certain Ella (Aelle) led the invaders ashore at a place called Cymenes ora and defeated the inhabitants. A further battle at a place called Mearcredesburne is recorded for 485, and in the annal for 491 we read that Ella and Cissa his son sacked Anderida (Pevensey) and slew the inhabitants. Ella is the first king of the invading race whom Bede describes as exercising supremacy over the southern English.

The history of Sussex now becomes a blank until 607 when Ceolwulf of Wessex is found fighting against the South Saxons. In 681 Wilfrid of York, on his expulsion from Northumbria by Ecgfrith, retired into Sussex, where he remained until 686 converting its pagan inhabitants. According to Bede, Aethelwald, king of Sussex, had been previously baptized in Mercia at the suggestion of Wulfhere, who presented him with the Isle of Wight and the district about the river Meon in Hampshire. After Wilfrid's exertions in relieving a famine which occurred in Sussex the king granted to him eighty-seven hides in and near the peninsula of Selsey which, with a lapse until 709 after Wilfrid's retirement, remained the seat of the South Saxon bishopric until the Norman Conquest. Shortly afterwards, however, Aethelwald was slain and his kingdom ravaged by the exiled West Saxon prince Ceadwalla. The latter was eventually expelled by two princes Berhthun and Andhun, who assumed the government of the kingdom. In 686 the South Saxons attacked Hlothhere, king of Kent, in support of his nephew Eadric, but soon afterwards Berhthun was killed and the kingdom subjugated for a time by Ceadwalla, who had now become king of Wessex.

Of the later South Saxon kings we have little knowledge. In 692 a grant is made by a king called Nothelm to his sister, which is witnessed by two other kings called Nunna and "Uuattus." Nunna is probably to be identified with Nun, described in the Chronicle as the kinsman of Ine of Wessex who fought with him against Gerent, king of the West Welsh, in 710. According to Bede, Sussex was subject to Ine for many years. A grant, dated by Birch about 725, is made by Nunna to Eadberht, bishop of Selsey, and to this too "Uuattus" appears as a witness. In 722 we find Ine of Wessex at war with the South Saxons, apparently because they were supporting a certain Aldbryht, probably an exile from Wessex. An undated grant is made by Nunna about this time, which is witnessed by a King Aethelberht. After this we hear nothing more until shortly before 765, when a grant of land is made by a king named Aldwulf with two other kings, Aelfwald and Oslac, as witnesses. In 765 and 770 grants are made by a King Osmund, the latter of which is witnessed by Offa of Mercia. Offa also appears as witness to two charters of an Aethelberht, king of the South Saxons, and in 772 he grants land himself in Sussex, with Oswald, *dux* of the South Saxons, as a witness. It is probable that about this time Offa definitely annexed the kingdom of Sussex, as several persons, Osmund, Aelfwald and Oslac, who had previously used the royal title, now sign with that of *dux.* In 825 the South Saxons submitted to Ecgberht, and from this time they remained subject to the West Saxon dynasty.

Earle and Plummer, Oxford, 1899); Bede, *Historia Ecclesiastica*, i. 15, ii. 5, iv. 13, 15, 16, 26, v. 18, 19, 23 (ed. C. Plummer, Oxford, 1896); W. de G. Birch, *Cartularium Saxonicum*, Nos. 78, 144, 145, 197, 198, 206, 208, 211, 212, 1334 (1885–93). (F. G. M. B.)

SUSU, a tall people of French Guinea and Sierra Leone, with pleasant countenances, oval in shape, who tattoo three lines on the breast and beneath the eye. They live in confederate villages under a paramount chief, the houses of one family grouped together. Their material culture is fairly advanced. Marriage is usual between cross cousins and between the husband's brother and widow. Polygamy, with headship of the first wife, is common. Inheritance is patrilineal. The Susu have politico-religious confraternities, known as *Simo,* including as a rule three degrees for men. Their religion is animist but influenced by Islam. Susu is also the name of the fresh-water dolphin of the Ganges; it is blind, fish-eating and pale in colour. (*See* CETACEA.)

SUTHERLAND, EARLS AND DUKES OF. The first earl of Sutherland was a certain William (d. 1284), whose father, Hugh Freskin (d. 1204), acquired the district of Sutherland about 1197. Probably about 1230 William was created earl of Sutherland. His descendant William, the 4th earl (d. 1370), was a person of some importance in the history of Scotland; he married Margaret (d. 1358), daughter of King Robert Bruce. His descendant John, the 9th earl, died unmarried in 1514.

John's sister Elizabeth (d. 1535) married Adam Gordon (d. 1537), a younger son of George Gordon, 2nd earl of Huntly, and a grandson of King James I., and before 1516 Gordon became earl of Sutherland by right of his wife. He was succeeded by his grandson John (*c.* 1526–1567), the 2nd earl of his line, who was poisoned at the instigation of George Sinclair, 4th earl of Caithness. His great-grandson John, the 5th earl (1609–1663), was a strong Covenanter, being called by his associates "the good Earl John"; he fought against Montrose at Auldearn, but afterwards he rendered good service to Charles II. John Gordon (*c.* 1660–1733), who became the seventh earl in 1703, supported the revolution of 1688 and was a commissioner for the union of England and Scotland. He was a Scottish representative peer in four parliaments, president of the board of trade and manufactures, and lord-lieutenant of the eight northern counties of Scotland. He was active in putting down the rising of 1715. This earl, who took the name of Sutherland instead of that of Gordon, was succeeded by his grandson William (*c.* 1708–1750), a representative peer, who helped to suppress the rebellion of 1745. William, the next earl, died without male issue in 1766, his daughter Elizabeth (1765–1839) claiming the peerage. Her title thereto was confirmed by the House of Lords in 1771.

Established in the possession of the title and estates of the earldom, the countess of Sutherland was married in 1785 to George Granville Leveson-Gower (1758–1833), who succeeded his father as 2nd marquess of Stafford in 1803. In addition to the estates of the marquessate of Stafford, Leveson-Gower inherited the Bridgewater Canal and estates from his maternal uncle, Francis Egerton, 2nd duke of Bridgewater, and these properties, together with his wife's estates, which included almost the whole of the county of Sutherland, made him a "leviathan of wealth," as he is called by Charles Greville. In 1833 he was created duke of Sutherland. Leveson-Gower was a member of parliament from 1778 to 1784, and again from 1787 to 1798 and was British ambassador in Paris from 1790 to 1792. From 1799 to 1810 he was joint postmaster-general. He was a collector of paintings, and purchased Stafford House, London. He was responsible for the construction of about 450 m. of road and of many bridges, but his policy of removing a large number of his tenants from the interior to the coast aroused bitterness and criticism. However, he reduced rents and brought thousands of acres into cultivation. He died at Dunrobin Castle on July 5, 1833.

See Sir Robert Gordon and George Gordon, *Genealogical History of the Earldom of Sutherland* (Edinburgh, 1813); and also the article STAFFORD, EARLS AND MARQUESSES OF.

SUTHERLANDSHIRE, county, northern Scotland, bounded north and west by the Atlantic, east by Caithness, south-east by the North Sea and south by the shire of Ross and Cro-

marty. Area, 1,297,914 acres (excluding water). The western and northern shores are indented with beautiful bays and sea-lochs, and terminate at many points in precipices and rugged headlands. Almost the whole county is mountainous; the summits are often of finer outline than those of the Grampian heights to the south, and the surface generally consists of wild desolate moorland. The highest point is Ben More in Assynt (3,273 ft.).

An irregular line from Loch Eriboll on the north coast to the neighbourhood of Cromalt near the southern boundary separates the two rock groups that form the foundation of the major portion of the county. On the western side of this line are ancient gneisses and schists (the Lewisian gneiss); these are penetrated by innumerable basic and acid dikes which generally have a north-west to south-east trend On the eastern side of the line, occupying the whole of the remaining area except the eastern fringe of the county, is a younger series of metamorphic rocks, the Moine schists. In the north-west Torridonian breccias and sandstones rest unconformably on this gneiss, and Cambrian rocks upon the Torridonian; the white Cambrian quartzite capping the dark Torridonian rocks on some of the hills forms a striking scenic feature. Granite masses appear in the eastern schists, and patches of Old Red Sandstone form high land near the south-east coast Evidence of glacial action is widespread.

The chief river is the Oykell, which, rising in Coniveall (3,234), a peak of Ben More, flows south and then south-east for 33 m to Dornoch Firth Other rivers flowing to Dornoch Firth are the Helmsdale (22 m), the Brora (28 m), preserving in its name (bridge river) the fact that its bridge was once the only important one in the county; and the Fleet (17), the estuary of which was embanked for 1,000 yd. in 1813 by Thomas Telford, whereby rich alluvial land was reclaimed. The Halladale (22), rising in Knockfin on the borders of Caithness enters the sea to the east of Portskerry. The shire is honeycombed with lakes and tarns, but the only large lake is Loch Assynt, 6½ m long, 215 ft. above the sea, with a greatest depth of 282 ft., emptying by the Inver The ratio of the area of islands to the loch is greater than in any other British lake There are many waterfalls; those of Escuallin, near the head of Glencoul, are among the finest in Great Britain

Agriculture and Industry.—Only one-fortieth of the total area is under cultivation, the shire ranking lowest in Scotland in this respect. The great mass of the surface is grazing ground and deer forest The best land adjoins Dornoch Firth, where farming is in an advanced condition, but there are fertile patches along the river valleys. At the beginning of the 19th century the first duke of Sutherland (then marquis of Stafford) adopted a policy of wholesale clearance of the crowded crofters of the interior to the coast. The duke incurred great obloquy, but persisted in his policy, which included reduction of rent, reclamation of land, and abolition of the tacksman or middleman He also did much to open up the shire generally by the construction of roads and bridges. Attempts have been made to repeople some of the glens (Strathnaver, for example) depopulated by the clearances. Crofters still largely predominate, nearly half the holdings being under 5 acres. The average size of the holdings, 12½ acres, is the smallest in Scotland with the exception of the Shetland islands Oats, barley and potatoes are grown The raising of sheep, mostly Cheviot, is the staple business of the county, and cattle are also kept. Horses—principally ponies, though Clydesdales are used on the bigger farms—are kept almost wholly for agricultural purposes, and pigs are also reared Deer forests belonging to the duke of Sutherland cover a large area

Next to agriculture, the deep-sea fisheries and the salmon fisheries in the rivers are the most important interest Helmsdale and Golspie are fishing villages Herrings are the principal catch, but cod, ling and other fishes are also taken. Whisky is distilled at Brora; some woollens are manufactured at Brora and Rogart; coal is mined at Brora, and limestone and sandstone quarried. The exceptional facilities offered by the deer forests, moors and the many lochs and rivers attract large numbers of sportsmen; and Dornoch and Lochinver are in repute as holiday resorts. The L.M.S railway enters the county at Invershin, goes northward to Lairg, then east to Brora and north-east to Helmsdale, whence it runs north-west to Kildonan, and north to Forsinard, where it shortly afterwards leaves the shire The Glasgow steamers call at Lochinver about every ten days.

Population and Administration.—In 1921 the population was 17,802, the least densely populated of Scottish counties. Several islands lie off the west and north coast, but only Roan, at the entrance to Kyle of Tongue, is inhabited (41). In 1921 there were 68 persons speaking Gaelic only, 8,831 who spoke Gaelic and English The county returns one member to parliament with Caithness, and forms a joint sheriffdom with Ross and Cromarty, with a sheriff-substitute resident at Dornoch. The county is under school-board jurisdiction.

History and Antiquities.—Of the prehistoric inhabitants, there are considerable remains in the form of many *brochs* (or round towers), Picts' houses, tumuli, cairns and hut circles. Dun Dornadilla, in the parish of Durness, 4 m. south of Loch Hope, is a tower, 150 ft in circumference, still in good preservation. The Norse jarl Thorfinn overran the country in 1034 and the Scandinavian colonists called it, in relation to their settlements in the Orkneys and Shetlands, *Sudrland*, the "southern land," or Sutherland. After the conquest of the district by the Scottish kings, Sutherland was conferred on Hugh Freskin (a descendant of Freskin of Moravia or Moray), whose son William was created earl of Sutherland in 1228 by Alexander II On the south shore of Helmsdale creek stand the ruins of the castle in which the 11th earl of Sutherland and his wife were poisoned by his uncle's widow in 1567, with a view to securing the title for her only child who was next of kin to the earl and his son Ardvreck Castle, now in ruins, at the east end of Loch Assynt, was the prison of the marquis of Montrose after his defeat at Invercarron (1650), whence he was delivered up by Neil Macleod of Assynt for execution at Edinburgh. In the graveyard of the old church of Durness is a monument to Robert Mackay, called Rob Donn (the brown), the Gaelic poet (1714–1778).

SUTLEJ, river, India, one of the "Five Rivers" of the Punjab. It rises E S E of the Manasarowar lakes in Tibet, at an elevation of about 15,200 ft, threads its way through the gorges of the Himalayas with heights of 20,000 ft on either side, crosses Bashahr and the Simla hill states, and enters the British district of Hoshiarpur. Thence it flows through the plains of the Punjab, receives the Beas in Kapurthala state, and joins the Chenab near Madwala. From that point the whole river bears the name of Panjnad ("five rivers") until it falls into the Indus near Mithankot after a course of 900 m

The Sutlej supplies the Sirhind canal, which draws off its waters at Rupar, 100 m above the junction with the Beas; and the Upper and Lower Sutlej systems, which come below the junction. These irrigate altogether some 1,600,000 acres Extensions, now undertaken, include 3 new weirs on the Sutlej and 1 on the Chenab, irrigating over 5,000,000 acres A large dam on the Sutlej where it leaves the hills was under consideration in 1927

SUTRI (anc *Sutrium*), an episcopal town of Italy, 4 m. from the railway station of Capranica, which is 36 m from Rome; 955 ft. above sea-level Pop. (1921), 2,880. The town is situated on a hill surrounded by ravines, a narrow neck alone connecting it with the surrounding country. There are some remains of the ancient city walls. The crypt of the cathedral, with twenty columns, is Romanesque, and the campanile dates from 1207. In the cliffs to the south is the rock-cut church of the Madonna del Parto, formerly a Mithraeum; and close by is a rock-hewn amphitheatre, with axes of 55 and 44 yd, now most picturesque. Sutri, commanding the Via Cassia, is spoken of by Livy as one of the keys of Etruria, Nepet being the other. It came into the hands of Rome after the fall of Veii. Its importance explains, according to Festus, the proverb *Sutrium ire*, of one who goes on important business, as it occurs in Plautus. (T. A.)

SUTTEE, the Indian practice of concremation of a widow on the pyre of her deceased husband (Sanskr. *satī*, "true" wife). Whether the usage existed in Vedic India has been hotly debated World-wide primitive usage compelled a widow to be the wife of her husband's brother or near kinsman or, if he had been of princely standing, to be immolated with his concubines, slaves,

steeds, etc., at his tomb, to maintain his dignity in the next world. This usage eventually found priestly support in the Hindu conception of matrimony as a bond eternally renewed when the married pair were reborn in succeeding lives—a concept hard to reconcile with polygyny. In late Hindu myth Satī was Siva's spouse who, resenting a slight put upon her lord by her father, destroyed herself but was reincarnated as Umā, the beauteous wife of Siva. Here Satī's act is prompted by a very different motive, and the tale supports the view that the text of the *Rig-Veda* was tampered with, to support the Brahmanical ideal.

According to Diodorus Siculus, Strabo and St. Jerome, Suttee existed in the 4th century B.C. In mediaeval India the practice flourished among the Rajputs—and where Brahman influences were strong. The Satī too began to be worshiped as a Maha Satī or "great and true" wife, commemorated by a stone. Yet reformers denounced the usage, as in Malabar. Even the Brahmanical jurists sometimes deprecated *satī*, allowing the widow the option of living an ascetic life, with rights of inheritance. The Jains do not practice *satī*. Buddhism probably discouraged it. Sikhism expressly forbade it, yet on Ranjīt Singh's death in 1839, several of his widows were burnt. Outside British jurisdiction, *satī* continued in families of high rank until late in the 19th century. In British territory, it was not till 1829 that Lord William Bentinck, with some support from Indian opinion (*see* BRAHMA SAMĀJ) was able, despite strong protests, to make it a statutory offence.

BIBLIOGRAPHY.—H. Yule and A. C. Burnell, *Hobson-Jobson* (ed. W. Crooke, 1903) gives full extracts from ancient and modern writers on the practice; J. Jolly, *Recht und Sitte* (Strassburg, 1917).

SUTTER, JOHN AUGUSTUS (1803–1880), American pioneer, was born of Swiss parents at Kandern in the Grand Duchy of Baden on Feb. 15, 1803. He came to America in 1834 and purchased land in Missouri, but in 1838 went overland to California by way of the Oregon trail. Here he was given a grant of 49,000 ac. of land on the Sacramento river by the Mexican governor on condition that he would fortify and develop it into a strong Mexican outpost. Sutter became a citizen of Mexico and was appointed "Commissioner of Justice and Representative of the Government on the Frontier of the Rio del Sacramento." He built not only a strong fort and other buildings but a mill, tannery, distillery, blanket factory, blacksmith and other shops, for which he hired skilled workers. He imported Hawaiians and hired Indians to cultivate the land. He traded with the Indians for furs and purchased a schooner and other boats which plied on the Sacramento. More land was acquired and he rapidly became wealthy. His settlement, "New Helvetia," became a rendezvous for adventurers, sailors, trappers and hunters and for an increasing number of Americans. His growing strength and independence and, above all, his hospitality to the Americans, made him the object of increasing hostility on the part of the Mexican authorities. In 1846 when the Bear Flag revolt took place and Frémont (*q.v.*) arrived with American troops, Sutter at first maintained an appearance of fidelity to the Mexican Government. However, he made but little objection when Frémont took control of his fort and made use of his property. After California was acquired by the United States and settlement became more rapid Sutter felt the need of a new mill. It was while digging the mill race that the famous discovery of gold in California (1848) was made. Sutter tried to keep the strike a secret, but in vain, and his property was soon overrun by gold seekers from whom he could not protect himself. What was worse, the U.S. Supreme Court found the title to 98,000 ac. of his land invalid. Much of what was left him was used to reimburse those to whom he had granted subtitles which he was forced to make good. Soon he was bankrupt. From 1871 to the year of his death he petitioned Congress annually for some reimbursement for his services. He died at Washington, D.C., on June 18, 1880, the evening after Congress had again adjourned without recognition of his claims.

See B. Cendrars, *Sutter's Gold* (1926); T. J. Schoonover, *Life and Times of General J. A. Sutter* (1907); "John A. Sutter" in *Society of California Pioneers' Quarterly*, vol. v., pp. 39–53, 85–102 (1928).

SUTTNER, BERTHA, BARONESS VON (1843–1914), Austrian writer, was born at Prague on July 9, 1843, the daughter of Count Franz Kinsky, Austrian field marshal. Through her mother she was related to the German poet, Theodor Körner. She spent much time in Paris and in Italy. In 1876 she married the novelist, Freiherr Arthur Gundaccar von Suttner (1850–1902), and for nine years lived at Tiflis in the Caucasus. After 1885 she resided at Schloss Harmansdorf in Lower Austria. A fertile writer, her most famous tales and tracts denounce war, for instance, *Die Waffen nieder* (1889), *Krieg und Frieden* (1896), *Das Maschinen-Zeitalter, Zukunfts-Vorlesungen über unsere Zeit* (1899) and *Die Haager Friedenskonferenz* (1900). She founded the Austrian Society of Peace-lovers in 1891, and edited the monthly organ of the peace-movement, *Die Waffen Nieder*, established in Dresden in 1892. In 1905 she was awarded a Nobel prize of £5,000 for her peace propaganda. She died at Vienna on June 21, 1914.

Her *Memoiren* were published at Stuttgart in 1908. *See* also H. v. der Mandere, *Bertha Suttner* (1909).

SUTTON, SIR RICHARD (d. *c.* 1524), the founder, with William Smyth, bishop of Lincoln, of Brasenose college, Oxford, and the first lay founder of any college, was a barrister by profession, and in 1497 became a member of the privy council. In 1513 he became steward of the monastery of Sion, a house of Brigittine nuns at Isleworth. In 1508 Sutton obtained a 92 year lease of Brasenose Hall and Little University Hall for £3 per annum, and from that time until the end of his life was occupied in purchasing estates with which he might endow the new college.

SUTTON, THOMAS (*c.* 1532–1611), founder of Charterhouse school and hospital, obtained great wealth by the ownership of coal mines in Durham and also by his marriage in 1582 with Elizabeth (d. 1602), widow of John Dudley of Stoke Newington. His wish to devote some of his money to charitable purposes led him in 1611 to purchase for £13,000 the Charterhouse (*q.v.*) from Thomas Howard, earl of Suffolk. On this spot Sutton erected the hospital and school which he had originally intended to build at Hallingbury in Essex. Sutton died at Hackney on Dec. 12, 1611, and was buried in the chapel in the Charterhouse. His wealth was left for charitable uses, but in 1613 James I. diverted an allowance to his natural son, Roger Sutton.

SUTTON, an urban district of Surrey, England, 11 m. S. of London by the S. railway. Pop. (1921) 21,063. It adjoins the Banstead downs. The manor, according to Domesday, belonged to the abbey of Chertsey and continued so until the dissolution of the monasteries by Henry VIII.

SUTTON COLDFIELD, municipal borough in Warwickshire, England, 7 m. N.E. from Birmingham on the L.M.S.R. Pop. (1921) 23,020. The town is the centre of a residential district for Birmingham, Walsall and other towns. The church of the Holy Trinity, Early English and Late Perpendicular, enlarged in 1879, contains a Norman font. On the park (2,400 ac.), the inhabitants have the right of grazing horses and cattle at a small fee. This, with the Crystal Palace gardens, forms a public recreation ground. In the vicinity are New Hall (13th century), with a hall of the 16th, used as a boys' school.

Sutton Coldfield is mentioned in the Domesday Survey as a possession of the Conqueror and as having been held by Edwin, earl of Mercia. Henry I. exchanged it with the earl of Warwick. By the time of Henry VIII. the town had fallen into ruin. It received a charter of incorporation in 1529, owing to the interest of John Vesey, bishop of Exeter, a native of the place, and received a further charter in 1664. Fairs were granted in 1300, 1353 and 1529, to be held at the feasts of Trinity, Michaelmas and St. Simon and St. Jude, and are now held on Trinity Monday, March 14, Sept. 19 and Nov. 8.

SUTTON-IN-ASHFIELD, market town, Nottinghamshire, England, on the border of Sherwood Forest, on the L.M.S. and L.N.E.R., 13 m. N. of Nottingham. Pop. (1921) 23,855. The church of St Mary Magdalene of the 12th and 14th centuries was restored in 1868. There are collieries and limeworks in the vicinity. Cotton hosiery and thread are the principal manufactures.

SUVÁROV, ALEXANDER VASILIEVICH, COUNT SUVÁROV RIMNIKSKY, PRINCE ITALYSKY (1729–1800), Russian field marshal, was born at Moscow on Nov. 24, 1729, the descendant of

a Swede named Suvor who emigrated to Russia in 1622. He entered the army as a boy, served against the Swedes in Finland and against the Prussians during the Seven Years' War. After repeatedly distinguishing himself in battle he was made a colonel in 1762 He next served in Poland, dispersed the Polish forces under Pulawski, stormed Cracow (1768) and was made a major-general. In his first campaigns against the Turks in 1773–74, and particularly in the battle of Kosludscki in the latter year, he laid the foundations of his reputation

From 1787 to 1791 he was again fighting the Turks and won many victories; he was wounded at Kinburn (1787), took part in the siege of Ochakov, and in 1788 won two great victories at Focsani and on the Rimnik. For the latter victory, in which an Austrian corps under Prince Josias of Saxe-Coburg participated, Catherine II. made him a count with the name Rimniksky in addition to his own name, and the emperor Joseph II created him a count of the Holy Roman Empire.

On Dec. 22, 1790, Suvárov stormed Ismail in Bessarabia, and the sack and the massacre that followed the capture equals in horror such events as the "Spanish Fury" and the fall of Magdeburg. He was next placed at the head of the army which subdued the Poles, and repeated the triumph, and some of the cruelties, of Ismail at Warsaw He was now made a field marshal, and was retained in Poland till 1795, when he returned to St Petersburg.

His sovereign and friend Catherine II. died in 1796, and her successor Paul dismissed the veteran in disgrace But in February 1799 he was summoned by the tsar to take the field again, this time against the French Revolutionary armies in Italy.

The campaign (*see* French Revolutionary Wars) opened with a series of victories (Cassano, Trebbia, Novi) which reduced the French government to desperate straits and drove every French soldier from Italy, save for the handful under Moreau, which maintained a foothold in the Maritime Alps and around Genoa. Suvárov himself was made a prince. But the later events of the eventful year went uniformly against the allies Suvárov's lieutenant Korsákov was defeated by Masséna at Zürich, and the old field marshal, seeking to make his way over the Swiss passes to the Upper Rhine, had to retreat to the Vorarlberg, where the army, much shattered and almost destitute of horses and artillery, went into winter quarters Early in 1800 Suvárov returned to St. Petersburg in disgrace. Paul refused to give him an audience, and, worn out and ill, he died a few days afterwards, on May 18, 1800. But within a year of his death the tsar Alexander I. erected a statue to his memory in the Field of Mars, St Petersburg

Suvárov is specially the great captain of the Russian nation for his leadership responded to the character of the Russian soldier. In an age when war was mere diplomacy he restored its true significance as an act of force He spared his own soldiers as little as he showed mercy to the population of a fallen city. He was a man of great simplicity of manners, and while on a campaign lived as a private soldier But he had himself passed through all the gradations of military service; moreover, his education had been of the rudest kind. His gibes procured him many enemies. He had all the contempt of a man of ability and action for ignorant favourites and ornamental carpet-knights. Dragomirov (*q.v.*) avowed that his teaching was based on Suvárov's practice.

SUVLA BAY, LANDING AT AND BATTLE OF, 1915: *see* Dardanelles Campaign.

SUWALKI, a town of Poland, in the province of Bialystok, 65 m. by rail N W. of Grodno. Pop 24,000 The town grew up in the wild borderland between the settlements of the Teutonic Order and the Lithuanians, after the termination of the internecine wars between the two Polish colonists from Masovia penetrated into the forests and it is now a Polish town, though near the frontier of Lithuania. Its trade includes timber and grain.

SUWARRO (*Carnegiea gigantea*), a remarkable tree cactus, 15 to 70 ft. high, called also saguaro, giant cactus and monument cactus, native to arid districts in southern Arizona, south-eastern California and Sonora, Mexico. It has a stout, woody, vertically ribbed stem, 1 to 2 ft. in diameter, sometimes rising unbranched, like a green, fluted column, whence the name monument cactus; more frequently it bears a few large, stout, widely diverging candelabra-like branches, but occasionally it bears numerous branches which rise vertically from near the base like a group of organ pipes. Close to the top of the stem or branches it bears white flowers which are followed by crimson edible fruits. In Arizona, of which it is the floral emblem or State flower, a desert tract containing numerous fine living specimens of the tree was set apart in 1914 as the Papago Saguaro National Monument. (*See* Cactus: *Cereus*)

SUYŪṬĪ [Abū-l Fadhl'Abd ur-Rahmān ibn Abī Bakr Jalāl ud-Dīn us-Suyūṭī] (1445–1505), Arabian encyclopaedic writer, was the son of a Turkish slave woman. His father had been cadi in Suyūṭ (Upper Egypt) and professor in Cairo. The boy's training was taken in hand by a Sufi friend of the father. He was precocious, and in 1462 was already a teacher; in 1464 he made the pilgrimage to Mecca, and in 1486 was promoted to a chair in the mosque of Bibars. From 1501 he worked in seclusion at Rauḍa, an island of the Nile, and there died in 1505. He was one of the most prolific writers of the East.

A list of his works is given in C Brockelmann's *Gesch. der Arabischen Literatur*, ii 144–158 (Berlin, 1902) They deal with almost every branch of Moslem science and literature Among the best known are the *Itqān fi 'Ulūm ul-Qurān* (on the exegetic sciences of the Koran), published with an analysis by A Sprenger (Calcutta, 1852–1854) and often in Cairo, the commentary on the Koran, known as the *Tafsīr ul-Jalalain*, begun by Jalāl ud-Dīn ul-Mahalli (1389–1459) and finished by Suyūṭī, published often in the East, and the history of the caliphs, published at Calcutta (1858) and elsewhere.

SUZERAINTY. "Suzerain," a term of feudal law, is now used to describe persons or States in positions of superiority to others. Suzerain has been defined as "Qui possède un fief dont d'autres fiefs relèvent" (*Littré* and *Dictionnaire de l'académie française*). The term was rare in feudal times in England. But it was used in France to describe a feudal lord, the supreme suzerain being the king

In modern times the term has come to be used as descriptive of relations, ill-defined and vague, which exist between powerful and dependent States; its very indefiniteness being its recommendation. According to feudal law the vassal owed certain duties to the lord; he promised fidelity and service; and the lord was bound to perform reciprocal duties, not very clearly defined, to the vassal —*Dominus vassallo conjux et amicus dicitur.* The relation between a lord and his vassals, implied in the oath of fealty, has been extended to States of unequal power; it has been found convenient to designate certain States as vassal States, and their superiors as suzerains. Originally and properly applicable to a status recognized by feudalism, the term vassal State has been used to describe the subordinate position of certain States once parts of the Ottoman empire. Such were Egypt and Bulgaria

M. Gairal (*Le Protectorat international*) distinguishes suzerainty from protectorate in these respects: (*a*) suzerainty proceeds from a concession on the part of the suzerain (p. 112); (*b*) the vassal State is bound to perform specific services; and (*c*) the vassal State has larger powers of action than those belonging to a protected State; (*d*) there is reciprocity of obligation. According to M. F. Despagnet the term suzerain is applicable to a case in which a State concedes a fief, in virtue of its sovereignty (*Essai sur le protectorat international*, p. 46), reserving to itself certain rights as the author of this concession.

W. E Hall thus defines vassal States: "States under the suzerainty of others are portions of the latter which during a process of gradual disruption or by the grace of the sovereign have acquired certain of the powers of an independent community, such as that of making commercial conventions, or of conferring their exequatur on foreign consuls. Their position differs

from that of the foregoing varieties of States (protectorates, etc.), in that a presumption exists against the possession by them of any given international capacity" (*International Law,* 4th ed., p. 31).

On the whole, usage seems to favour this distinction: while a protectorate flows from, or is a reduction of, the sovereignty of the protected State, suzerainty is conceived as derived from, and a reduction of, the sovereignty of the dominant State.

As to the power of making treaties, a vassal State cannot, as a rule, conclude them; such power does not exist unless it is specially given. On the other hand, a protected State, unless the contrary is stipulated, retains the power of concluding treaties.

Definitions of suzerainty are of little use. Each instrument in which the word is used must be studied in order to ascertain its significance. Even in feudal times suzerainty might be merely nominal, an instance in point being the suzerainty or over-lordship of the papacy over Naples. In some cases it may be said that suzerainty brings no practical advantages and implies no serious obligations. Among the instances in which the term is actually used in treaties are these: the General Treaty, Peace of Paris, 1856 (arts. 21 and 22), recognized the suzerainty of Turkey over the Danubian principalities Moldavia and Wallachia, modifying the "sovereignty" of Turkey recognized by the Treaty of Adrianople. The convention of Aug. 19, 1858 (Hertslet x. 1052) organized the then principalities "under the suzerainty of the sultan." The internal government was to be exercised by a hospodar, who received his investiture from the sultan, the sign of vassalship. The autonomy of these vassal States was fully recognized by the Treaty of Berlin of 1878. In the Interpretation Act 1889, s. 18 (5), "suzerainty" is used to describe the authority of the sovereign over native princes.

The word suzerain is used in the Pretoria convention of 1881 between the British Government and the late South African republic. The convention (by its preamble) granted to the inhabitants complete self-government, "subject to the suzerainty of her Majesty," and this suzerainty was reaffirmed in the articles. Even when the convention was being negotiated doubts arose as to its meaning, and legal authorities were divided as to its effect. It was doubtful whether territory could be ceded by the Crown of its own authority; and if the power existed the cession could, it was said, be made only by virtue of clear words. From the articles substituted in the London convention of 1884 for those of 1881, the word "suzerainty" was omitted. Fresh doubts arose as to the effect of this omission; before the outbreak of hostilities in South Africa, the British Government maintained that the preamble of 1881, by which alone any self-government was granted, was still in force, and therefore that the suzerainty—whatever it involved—remained; the Transvaal Government, on the other hand, contended that the suzerainty had been abolished by the substitution of the 1884 convention for that of 1881. (*See* MANDATE, PROTECTORATE, SOVEREIGNTY, SPHERES OF INFLUENCE, STATE.)

ŠVABINSKÝ, MAX (1873–), Czech painter, was born at Kroměříž in Moravia. He studied at the Academy of Fine Arts in Prague, where he became a professor; and in Paris, Germany, Holland and Belgium. His first works were made to suit the poetical and symbolic mood prevalent at the time, but he soon turned his attention to realistic subjects, from which he derived the sources of an art intoxicated with the manifestations of life and nature. His large-sized canvases, "The Sun Bath" (1908), "Summer" (1909) and "The Family in the Mountains," provide typical examples. Švabinský has painted many portraits, for instance, of Mánes, Smetana and President Masaryk and of Maeterlinck. Also, there are his etchings and the woodcuts entitled "The Sonata of Paradise" (1918–20).

SVANE [or SVANING], **HANS** (1606–1668), Danish statesman and ecclesiastic, was born on March 27, 1606, at Horsens, where his father, Hans Riber, was burgomaster. His mother Anne was a daughter of the historian Hans Svaning, whose name, subsequently altered to Svane, he adopted. After seven years' residence abroad Svane became professor of Oriental languages at the university of Copenhagen. In 1646, he turned to theology. He became bishop of Sjaelland in 1655. As a theologian he belonged to the severely orthodox Lutheran school. At the *rigsdag* of 1660 he played an important political rôle. He proposed that only members of the council of state should be entitled to fiefs and that all other estates should be leased to the highest bidder whatever his social station. At a hint from the king he tried to get the royal charter abolished and the elective monarchy transformed into an hereditary monarchy. The clerical deputies followed him in a serried band, as the burgesses followed Nansen, and the bishop's palace was one of the meeting-places for the camarilla which abetted absolutist designs of Frederick III.

It was on Svane's motion (Oct. 8) that the Commons agreed "to offer his majesty the crown as an hereditary crown." Svane quashed the timid attempt of the more liberal minded of the deputies to obtain from the king some sort of a constitution. He proposed the erection of a consistorial college for managing all the temporal affairs of the church, including education and poor relief, anticipating to some extent the modern ministries of education and public worship, which unfortunately was not adopted. The privileges which he obtained for the clergy increased the independence of the Danish Church in difficult times. Svane died on July 26, 1668, in his 62nd year.

See Detlev Gotthard Zwergius, *Siellandske clerisie* (Copenhagen, 1754). (R. N. B.; X.)

SVANETIA, a mountainous district on the south slopes of the Caucasus. (*See* GEORGIA.)

SVEHLA, ANTONIN (1873–), Czech statesman, was born at Hostivar, near Prague. He was a founder and (1909) chairman of the Czech Agrarian party. Contact with Masaryk enabled him to complete the preparations for the final coup against Austria on Oct. 28, 1918, when in his capacity as vice-president of the Prague National Committee, together with Dr. Soukup and J. Stríbrný, he took over the Government of the Czechoslovak State on behalf of the Czechoslovak National Council, which in the summer of 1918 had been recognized as the Czechoslovak Provisional Government. He became a member of the first National Assembly and was minister for the interior until Oct. 1922, when he formed a new Coalition, reconstituted after the Oct. 1925 elections, so as to include the "Big Business Party." But on March 16, 1926, Svehla resigned. He formed his third administration on Oct. 28, 1926, two German Bohemians being included in his cabinet. The German bourgeois group in the Chamber supported him in a reversion to the four main provinces into which Czechoslovakia was divided before 1920, in preference to the county system then established. His health failed in the autumn of 1927, and in Jan. 1929 he resigned. (*See* also CZECHOSLOVAKIA: *History.*)

SVENDBORG, a seaport of Denmark, capital of the *amt* (county) of its name, on the island of Fünen. Pop. (1928), 14,419. The narrow Svendborg Sund separates Fünen from the lesser islands of Taasinge (245 ft.) and Turø. Inland there is also elevated ground, the Ovinehøi. The harbour is accessible to vessels drawing 20 ft. Near the town are the ruined castle of Ørkil, the watering-place Christiansminde, and the orchards of Gammel Hestehave, where wine is produced.

SVENDSEN, JOHANN SEVERIN (1840–1911), Norwegian composer, was born in Christiania on Sept. 30, 1840. He learnt the violin from his father, and after serving in the army, and touring with an orchestra, he entered the conservatorium at Leipzig through the aid of the king of Sweden. In 1883 Svendsen

became court kapellmeister at Copenhagen. Though Svendsen was at one time intimate with Wagner, his own music was not influenced by him His works include two symphonies, a violin concerto, a romance for violin and orchestra, and Norwegian rhapsodies for the orchestra He died in Copenhagen on June 14, 1911.

SVERDLOVSK (formerly Ekaterinburg), the chief town of the Uralsk Area of the Russian S F S R on the eastern foothills of the Ural mountains It is the centre of a gold, platinum, copper and coal-mining district; its population rose from 55,488 in 1897 to 136,494 in 1926. The important Verkhne-Iset copper mine, unlike most other copper mines in Russia, is still working (1928) An electric power station was opened in 1925–26, with a capacity of 6,000 kw, and supplies the numerous industrial undertakings which include iron, copper smelting, platinum refining, the manufacture of machinery and linen goods. There is also a jewel cutting and polishing industry, Sverdlovsk emeralds being specially famous. The town has a chemical laboratory for the assay of gold, a mining school and a magnetic and meteorological observatory.

Mining was developed here by Peter the Great in 1721 and the town was named Ekaterinburg in honour of his wife Catherine I. In 1735 a government mint for copper coinage was established and later a government engineering works, and an imperial factory for the cutting and polishing of malachite, jasper, marble, porphyry and other ornamental stones. In 1763 the Siberian highway was diverted to the town from Verkhoturye. This gave a great impetus to the two annual trading fairs, dealing mainly in cattle, cereals, iron, woollen and silk goods, and products from Siberia and Central Asia Later the town became a railway centre and developed rapidly; it is well built, with wide streets The Cathedral of St. Catherine's was completed in 1758, and that of the Epiphany in 1774. Sverdlovsk was a storm centre during the civil wars following the 1917 revolution; and it was captured by the Czech army under Gajda In July 1918, the Czar Nicholas II., his wife, their four daughters and only son, were executed in a house formerly belonging to a merchant named Ipatiev

SVERDRUP, JOHAN (1816–1892), Norwegian statesman, was born at Jarlsberg on July 30, 1816 His father, Jakob Sverdrup, was a land steward, and the founder of the first school of agriculture in Norway Johan entered the Storthing in 1850 He built up a strong political party, supported by the peasantry, and in 1872, secured a bill for the admission of ministers to the Storthing, which was a step to parliamentary control King Charles XV refused his sanction to this bill, and on its third passing in 1880 Oscar II opposed his absolute veto Sverdrup then proposed the proclamation of the law in defiance of the king's action The retirement of Frederik Stang removed Sverdrup's chief political opponent from the field He was aided in his campaign by Björnstjerne Björnson, and after a series of political crises he became prime minister in June 1884 He soon found himself at issue with Bjornson on church matters, although during his term of office no fewer than eighty-nine measures, many of them involving useful reforms, became law, he failed to satisfy the extremists and was driven to rely on the moderate Liberals. He was compelled to retire in 1889, and died on Feb 17, 1892, at Christiania

SWABIA, Suabia or Suevia (Ger *Schwaben*), one of the stem-duchies of mediaeval Germany, taking its name from the Suevi, a tribe who inhabited the district in the first century of the Christian era They were joined by other tribes, and the district was called Alamannia, until about the 11th century, when the form Swabia began to prevail In 496 the Alamanni were defeated by Clovis and governed by dukes dependent on the Frankish kings In the 7th century the people were converted to Christianity, bishoprics were founded at Augsburg and Constance, and in the 8th century abbeys at Reichenau and St. Gall The Alamanni had gradually thrown off the Frankish yoke, but in 730 Charles Martel again reduced them to dependence.

The duchy, bounded by the Rhine, the lake of Constance, the Lech and Franconia, was ruled by the counts of Raetia, one of whom, Burkhard, took the title of duke in 917 and was recognized as such by King Henry I, the Fowler, in 919 On his death in 926 he was succeeded by Hermann, a Franconian noble, who married his widow. When Hermann died in 948 Otto the Great gave the duchy to his own son Ludolf, who had married Hermann's daughter Ida; but he reduced the ducal privileges and appointed counts palatine to watch the royal interests. Ludolf revolted and was deposed, and other dukes followed in quick succession. During these years the Swabians were loyal to the kings of the Saxon house. In 1077, Rudolph, count of Rheinfelden, as duke, was chosen German king in opposition to the emperor Henry IV, but found little support in Swabia, which was given by Henry to his faithful adherent, Frederick I., count of Hohenstaufen Frederick II. succeeded his father in 1105, and was followed by Frederick III., afterwards the emperor Frederick I The earlier Hohenstaufen increased the imperial domain in Swabia, where they received steady support, although ecclesiastical influences were very strong After numerous changes, the chief authority in Swabia in 1268 fell to the counts of Wurttemberg, the margraves of Baden, the counts palatine of Tubingen and the counts of Hohenzollern.

SWABIAN LEAGUE, an association of German cities, principally in the old duchy of Swabia. The cities had attained prosperity under the Hohenstaufen emperors, but on the extinction of that house in 1268, they were ill-defended against aggression by succeeding dynasties

In 1331, 22 Swabian cities, including Ulm, Augsburg, Reutlingen and Heilbronn, formed a league at the instance of the emperor Louis the Bavarian, who in return for their support promised not to mortgage any of them to a vassal. The count of Wurttemberg was induced to join in 1340. Under Charles IV. the lesser Swabian nobles began to combine against the cities, and formed the *Schlegelerbund* (from *Schlegel,* a maul) Civil war ensuing in 1367, the emperor, jealous of the growing power of the cities, endeavoured to set up a league under his own control, for the maintenance of public peace The defeat of the city league by Eberhard II. of Württemberg in 1372, the murder of the captain of the league, and the breach of his obligations by Charles IV, led to the formation of a new league of 14 Swabian cities led by Ulm in 1376. This league triumphed over the count of Wurttemberg at Reutlingen in 1377, and the emperor having removed his ban, it assumed a permanent character, set up an arbitration court, and was rapidly extended over the Rhineland, Bavaria and Franconia Its professed aims were the maintenance of the imperial status of the constituent cities, the security against sale or mortgage and against excessive taxation, the protection of property, trade and traffic, and the power to suppress disturbances of the peace. There is no trace of co-operation with the Hanseatic towns

For nearly a century there was no great effort at federation among the Swabian cities, though there were partial and short-lived associations The growing anarchy in Swabia, where the cities were violently agitated by the constant infringement of their liberties (*e g.*, the annexation of Regensburg by Bavaria in 1486), induced Frederick III, who required men and money for the Hungarian War, to conciliate the cities by propounding a scheme of pacification and reform. His commissioner, Count Hugo of Werdenberg, met the Swabian estates at Esslingen, and on Feb 14, 1488, the Great Swabian League was constituted There were four constituent parties, the archduke Sigismund of Austria, Count Eberhard V. of Württemberg, who became the first captain of the league, the knightly league of St George, and lastly 22 Swabian imperial cities. The league received a formal constitution with a federal council consisting of three colleges of nine councillors each, a captain and a federal court with judicial and executive powers. The armed force which was to police Swabia consisted of 12,000 foot and 1,200 horse, each party contributing one-fourth. The league gained strength by the speedy accession of Augsburg and other Swabian cities, the margraves of Brandenburg-Ansbach, Bayreuth and Baden, the four Rhenish electors, etc., and in 1490 of Maximilian, king of the Romans, whom the league had helped to rescue from the hands of the Netherlanders in 1488. It did not render him the support he expected in his foreign policy, but it performed its primary work

of restoring and maintaining order with energy and efficiency. In 1492 it compelled Duke Albert of Bavaria to renounce Regensburg; in 1519 it expelled the turbulent duke, Ulrich of Württemberg who had seized Reutlingen, and it sold his duchy to Charles V.; and in 1523 it defeated the Franconian knights who had taken up arms with Franz von Sickingen. In 1525 Truchsess, the league captain, aided by the forces of Trier and the palatinate, overthrew the rebel peasants of Königshofen on the Tauber and at Ingolstadt. The league, after several renewals, expired on Feb. 2, 1534, its dissolution being due to the Reformation. Futile attempts were made to renew it, in 1535 by the Bavarian chancellor, Eck, and in 1547 by Charles V.

See E. Osann, *Zur Geschichte des schwäbischen Bundes* (Giessen, 1861); K. Klüpfel, *Urkunden zur Geschichte des schwäbischen Bundes* (Stuttgart, 1846–53), "Der schwäbische Bund," *Hist. Taschenbuch* (1883–84). (A. B. G.)

SWAFFHAM, a town in Norfolk, England; 111 m. N.N.E. from London by L.N.E.R. Pop. (1921) 2,913. The cruciform church of St. Peter and St. Paul is Perpendicular, with central tower, and a carved wood roof. At Castle Acre, 4 m. N., are the ruins of a Cluniac priory, founded shortly after the Conquest by William de Warren. The castle of the founder has little left but its foundations, surrounded by a series of earthworks. The church of St. James, Castle Acre, contains Early English and Perpendicular work.

SWAHILI (swäh-hē′lĭ) (*Wa-Swahili, i.e.,* coast people, Ar. *sāhil,* coast), a term commonly applied to the inhabitants of Zanzibar and of the opposite mainland between the parallels of 2° and 9° S., who speak the Ki-Swahili language. The Swahili are derived from the negroes of the coast and the Arabs, with a varied admixture of slave blood. Colour and physique thus range from the full-blooded negro to the pure Semite. They are strong, handsome and inclined to stoutness.

BY COURTESY OF FREDERICK B. PATTERSON
A SWAHILI ELEPHANT TRACKER OF BRITISH EAST AFRICA

SWAHILI LANGUAGE. Swahili belongs to the Bantu family of languages (*q.v.*) and is spoken on the eastern coast of Africa, ranging approximately from Warsheikh, on the Somali coast, to the mouth of the Ruvuma (10° 30′ S.). It has also obtained wide currency as a trade language, having been carried by Arab caravans to the region of the Great Lakes before the middle of the 19th century and, since then, through European influence, into the Congo basin; and, in a very debased form, it is the vernacular of some Pygmy tribes on the Ituri.

Origin and History of the Language.—Swahili is not the language of any particular tribe; it grew up among the descendants of the Arab settlers on the coast, who intermarried with native women—usually Bantu. The name is derived from the Arabic Sâhil (ساحل), which means "the coast," the Arab colonists and their descendants being known simply as "the Coast-Dwellers." In the native speech, in which every syllable ends in a vowel, Sâhil became Swahili (accent on the second syllable). Pokomo, the speech of a very interesting Bantu tribe inhabiting the Tana valley, may have formed the groundwork of Swahili. The Pokomo would probably be the first Bantu tribe to meet the Arab colonists. Intercourse between Arabia and the east coast of Africa is as early as the 1st century A.D., when, as we learn from the *Periplus of the Erythraean Sea,* the people of Muza (in Southern Arabia) "sent thither many large ships, using Arab captains and agents, who are familiar with the natives and intermarry with them." But the earliest known settlement, that is Pate, is said to have been founded A.D. 689.

The Swahili language was first made known to Europeans by Henry Salt, whose *Travels* (he visited Abyssinia in 1809, by way of the Cape of Good Hope) was published in 1814. He calls it "Sowauli" and gives a short and very imperfect vocabulary. The first real study of the language was made by Johann Ludwig Krapf, 1810–82, a German who went to East Africa in the service of the Church Missionary Society, reaching Mombasa in 1844. His dictionary, recently revised and supplemented by Archdeacon Binns, is still a standard work; the principal English contributors to the subject are Edward Steere (Bishop of Zanzibar from 1874 to 1882), Arthur C. Madan (d. 1920) and the late William Ernest Taylor, for many years a missionary in Kenya Colony.

Character of the Language.—Swahili is a Bantu language. Its grammatical structure has been little affected by Arabic influence. It includes Arabic words. Contact with outside influences has tended to efface some characteristic Bantu peculiarities and brought about an extensive use of borrowed prepositions and adverbs, which gives it greater elasticity and increases its possibilities as a literary language.

Swahili has no grammatical gender, but a division of nouns into classes, each with its characteristic pronoun; it inflects nouns by means of prefixes, makes the possessive agree with the thing possessed ("the house of the man" not "the man's house"), and places the object-pronoun between the subject-pronoun and the verb, as if one should say "I him saw," in one word. Though these classes and their concords look formidable, the language is by no means difficult to learn and is quite easy to pronounce.

As the official language of Kenya Colony and Tanganyika Territory, it is indispensable to all civil servants, to settlers, missionaries and business men. It is spoken and understood by many natives, even where it is not the local vernacular.

Dialects and Literature.—The principal dialects are those of Lamu (northern), Mombasa (central) and Zanzibar (southern); the last-named being the standard for official use. That of Lamu has preserved many archaisms and comes nearest to that known as "Kingozi," in which the ancient poems, and those more recently imitated from them, are composed. A large body of poetry exists in manuscript, some few specimens having been published in Europe. The metres used are adapted from the Arabic, as closely as the differing rhythm of the two languages permits. Those traditionally attributed to Liongo Fumo may, if authentic, go back to the 12th or 13th century, and their language is certainly very archaic. In prose, almost the only texts available till recently, have been taken down by Europeans from native recitation, but of late years (not to mention translations made by Europeans) native writers have begun to appear, and the Swahili magazine, *Mambo Leo* published at Dar-es-Salaam, under European editorship, attracts an increasing number of native contributors. There is an immense amount of traditional matter in circulation: folk-tales, some indigenous to the soil, others of Indian, Persian or Arab origin, which, filtered through generations of oral transmission, have acquired a distinctly African colouring. The people, both men and women, have the same facility of improvisation as the Italian peasants. Some songs have a rhythm (probably chanted to the drum) but no metre. Others have both metre and rhyme, often of a very pleasing character. Songs and proverbs —frequently very pithy—have been collected.

Werner, *The Bantu Languages* (1919, bibl.); A. and M. Werner, *A First Swahili Book* (1927). (A. We.)

SWALLOW, the familiar bird, *Hirundo rustica,* in summer ranges all over Europe, and most of Asia; in winter it migrates south, reaching India, Burma, the Malay peninsula, and the whole of Africa. The common swallow of North America is the barn-swallow, *H. erythrogastra;* in summer it reaches Alaska, Greenland, and Lake Baikal. The winter migration extends to South Brazil. Returning in summer about the first week in April, the English swallow usually repairs to its old nest, near the abodes of men.

During spring, the swallow sings a sweet bubbling song. The food consists entirely of insects captured on the wing. The birds also drink on the wing from the surface of ponds and lakes. The nest is formed of moist earth, which, carried to the spot in the bird's bill, is arranged and modelled with short straws or slender

sticks, into the required shape, generally that of a half-saucer. The materials dry quickly into a hard crust, which is lined with soft feathers, and therein are laid from four to six white eggs, blotched and speckled with grey and orange-brown, deepening into black. Two broods are usually reared in the season. The young, on leaving the nest, make their way to some leafless bough, whence they try their powers of flight, at first accompanying their parents in short excursions on the wing, receiving from them food until able to shift for themselves. The young birds collect in flocks and leave the country about the end of August or early in September, to be followed, after a few weeks, by their progenitors. It was formerly believed that swallows hibernated (*see* Gilbert White, *Natural History of Selborne*). They moult their feathers in their winter quarters. The chestnut forehead and throat, the shining steel-blue upper plumage, the dusky white of the lower parts, and the deeply forked tail are familiar.

The word swallow is used for all the Hirundinidae, excepting the martin (*q v.*). The family includes from 80 to 100 species and has no near allies.

SWALLOW-HOLE, a cavity, forming the entrance to a subterranean stream-channel, produced by the solvent action of naturally acidulated water. Such holes are most commonly found in limestone and chalk districts. (*See* CAVE.)

SWAMMERDAM, JAN (1637–80), Dutch naturalist, was born on Feb. 12, 1637 at Amsterdam, the son of an apothecary and naturalist, and took his doctor's degree at Leyden in 1667

He neglected practice for investigations into the life histories of insects and into the anatomy of mayflies, bees and frogs As regards human anatomy, he advanced the study of the circulatory system by his experiments on infections. He proved the ovarian character of the female testicles, discovered the valves of the lymphatics, was the first to describe the red blood-corpuscles (1658), studied the movements of the heart, the lungs and the muscles and made an important medico-legal contribution by demonstrating the floating of the fetal lungs after respiration has once taken place By stopping his supplies, his father thought to induce him to practice, but the privation only impaired his health and he died at Amsterdam on Feb 15, 1680

He wrote *Allgemeene Verhandeling van bloedeloose diertjens* (Utrecht, 1669), *Miraculum naturae seu Uteri muliebris fabrica* (Leyden, 1672) and *Biblia naturae* (published by H. Boerhaeve in 1737).

SWAMP, a tract of wet, spongy, low-lying land, usually overgrown with vegetation, but too highly saturated with water to be fit for agricultural or pastoral purposes The term swamp, however, is often indiscriminately applied to various wet, watery or miry places, as a marsh or a bog or, as in Australia, a shallow pond or lake. But as more commonly understood, especially in the United States, where the word first came into recorded use (early in colonial days), a swamp is an area of very moist or wet ground, with luxuriant vegetation, and largely free from standing water. It thus differs from a marsh, which is covered for the most part with a thin sheet of water. A swamp differs in a corresponding degree from a bog, which is a very wet, water-logged area, practically without drainage, in which extensive decomposition of vegetable matter is taking place, forming in northern latitudes deposits of peat (*q.v*). A marsh or a bog may occur within or may border upon a swamp, with various intermediate stages in each case; hence the frequent interchange in meaning between these terms in popular usage

The character of the vegetation in swamps varies with the nature of the soil and the extent of drainage. Usually swamps are filled with a dense growth of coarse grasses, trees and shrubs. Swamps are found on the shoreward side of tidal marshes along seacoasts and near inland lakes and ponds with low shores; swamps are common also in the alluvial valleys of rivers and smaller streams Among swamps possessing marked historical as well as scientific interest are those in the Campagna near Rome, and those found in the Pripet marsh region in western Russia. Noteworthy swamp areas in the United States are the Great Dismal swamp in south-eastern Virginia, the cypress and the mangrove swamps of the Southern States, and the "tule" swamps of the San Joaquin valley in California. Vast swampy and boggy areas in northern Canada are known by the Indian name *muskeg*.

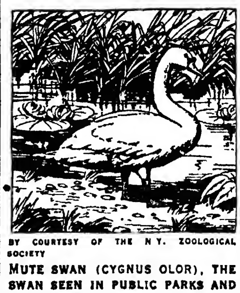
SWAMPSCOTT, a beautiful residential town and summer resort of Essex county, Massachusetts, U.S.A.; on Massachusetts bay, 13 m. N E. of Boston, adjoining Lynn. It is served by the Boston and Maine railroad Pop. (1925), 8,953 (State census)

SWAN, SIR JOSEPH WILSON (1828–1914), English physicist and electrician, was born at Sunderland on Oct. 31, 1828. After serving his apprenticeship with a druggist in his native town, he became first assistant and later partner in a firm of manufacturing chemists in Newcastle Among its operations this firm included the manufacture of photographic plates, and thus Swan was led to one of the advances in photography with which his name is associated—the production of dry plates, which were the outcome of an original observation made by him on the effect of heat in increasing the sensitiveness of a gelatine bromide of silver emulsion. In 1862 he patented the first commercially practicable process for carbon printing in photography. (*See* PHOTOGRAPHY.) In 1879 Swan patented bromide paper.

In 1860, he produced an electric lamp with a carbon filament, which was formed by packing pieces of paper or card with charcoal powder in a crucible and subjecting the whole to a high temperature. The carbonized paper thus obtained he mounted in the form of a fine strip in an evacuated glass vessel and connected it with a battery of Grove's cells, which though not strong enough to raise it to complete incandescence, were sufficient to make it red-hot. This was substantially the method adopted by Edison nearly twenty years later

Subsequently Swan devised a cotton thread "parchmentized" by the action of sulphuric acid, and on the 20th of October 1880 he gave at Newcastle the first public exhibition on a large scale of electric lighting by means of glow lamps. In another method devised by him, collodion was squirted into a coagulating solution and the tough threads thus obtained carbonized by heat. He also devoted attention to apparatus for measuring electric currents, to the improvement of accumulators and to the conditions governing the electro-disposition of metals. Swan was knighted in 1904. Holding many honours, he died at Warlingham on May 27, 1914.

SWAN, the name of birds forming the subfamily *Cygninae* of the *Anatidae*. The best-known species is the mute-swan (*Cygnus olor*), occurring wild in N E Europe and W. Central Asia, and kept semi-domesticated in parks and ornamental waters in most parts of Europe and America In olden times, the young swan or cygnet was highly esteemed for the table, and in England no subject could possess one without a licence from the Crown. In a wild state, all swans migrate south in winter. The plumage in both sexes is white, the beak orange, surmounted by a black knob, the legs black and the voice a grunting hiss. The swan builds a large nest of aquatic plants, in which it lays five to nine olive-grey eggs The young are at first clad in grey, replaced later by sooty-brown, and do not attain adult plumage for more than a year. The Polish swan has a pale bill and legs



BY COURTESY OF THE N Y. ZOOLOGICAL SOCIETY

MUTE SWAN (CYGNUS OLOR), THE SWAN SEEN IN PUBLIC PARKS AND GARDENS

Two other species of swans occur in Europe, over the greater part of which they are only winter visitors, breeding in the far North. These are the whooper swan (*C. musicus*) and the smaller Bewick's swan (*C. bewicki*). They may be distinguished from the mute-swan by their more upright carriage, the absence of the knob at the base of the bill and by the possession of loud and resonant voices (hence the legend of the "swan-song"). Two closely allied representatives occur in N. America, the trumpeter-swan (*C. buccinator*) with a black bill, and *C columbianus*. From S. America comes the black-necked swan (*C. melanocoryphus*), while the black swan (*C. atratus*), inhabits Australia.

SWAN, HUNTER, AND WIGHAM RICHARDSON, LTD. The "Prince Albert," the first iron vessel ever built on the Tyne, was launched in 1842, from the Neptune works of the firm. In 1850, the present Neptune Shipyard was opened, with a pay-roll of 200 men. The Wallsend shipyard of the company, owned by C. S. Swan and Hunter, was established in 1872, and in 1880 employed 700 men. In 1903, C. S. Swan and Hunter, Ltd., Wigham Richardson and Co., Ltd., and the Tyne Pontoons and Dry Docks Co., Ltd., became Swan, Hunter and Wigham Richardson, Ltd., and today is associated with Barclay, Curle and Co., Ltd., on the Clyde, and the Glasgow Iron and Steel Co., Ltd., Wishaw, owning blast furnaces, cement works, ore mines and collieries. The company also owns works at Southwick-on-Wear and Londonderry. In all the company has 30 shipbuilding berths, of which the largest are capable of taking vessels up to 1,000ft. in length. Four of these, at the Wallsend shipyard, are covered by glass-roofed sheds fitted with electric light, enabling work to proceed in any weather and by day or night. The capacity exceeds 150,000 gross tons a year, and in 1927, including the Clyde Yards, the firm launched 181,224 tons. The share capital (1928) is about £2,500,000, with £323,000 of debentures.

The company builds all classes of naval and mercantile vessels. At the Wallsend shipyard there is under construction (1928) the immense floating dock for the new Singapore naval base, with a lifting capacity of 50,000 tons. More than 30 floating docks have been built by the company in recent years. One of them was towed through the Straits of Magellan to Peru, a distance of 11,000 miles. The firm built the "Mauretania" (32,000 gross tons), for the Cunard Company, which, while more than once crossing the Atlantic at an average speed of 26 knots, averaged 25½ knots for 27 consecutive voyages. It holds (1929) all Atlantic records for speed.

During the World War nearly 100 warships, with 230 other vessels, were built by the company, while the production of marine engines was 1,750,000 i.h.p. (L. C. M.)

SWANAGE, a seaport in Dorset, England. Pop. (1921) 7,106. It lies on the so-called Isle of Purbeck, the district lying south of Poole harbour. The coast is wild and precipitous, and numerous caves occur in the cliffs. Swanage bay affords excellent bathing. Stone from the Purbeck quarries is exported.

SWANSEA, Welsh *Abertawe,* a seaport of Glamorganshire, South Wales. Pop. (1921) 157,554. The population of the old borough in 1801 was 6,099.

The *Via Julia* from Nidum (Neath) to Loughor probably passed through the north of the borough, where Roman coins were found in 1835. The name Swansea stands for Sweyn's "ey" or inlet, and may have been derived from Sweyn Forkbeard, who certainly visited the Bristol Channel. The earliest known form of the name is Sweynesse, which occurs in a charter granted by William earl of Warwick some time previous to 1184; in King John's charter (1215) it appears as Sweyneshe, and in the town seal, of mediaeval origin, it is given as "Sweyse." The Welsh name, Aber Tawy, first appears in Welsh poems of the beginning of the 13th century. The town grew up round the castle which Henry de Beauchamp (or Beaumont) on his conquest of Gower about 1099, built on the west bank of the river. The castle eventually came by marriage to the Somersets and is still held by the dukes of Beaufort. It was finally destroyed by Owain Glyn Dwr. In the Civil War the town was royalist till the autumn of 1645 when Colonel Philip Jones was made its governor. The older part of the town, being the whole of the municipal borough previous to 1836, occupies the west bank of the Tawe near its mouth and is now wholly given up to business. Stretching inland to the north along the river for some 3 m. through Landore to Morriston, and also eastwards along the sea margin towards Neath, is the industrial quarter, while the residential part occupies the sea front and the slopes of the Town Hill (580 ft. high) to the west, stretching out to Sketty. The Mumbles or Oystermouth and a large part of the Swansea rural district were included in the borough in 1918. The east side of the river is known as St. Thomas's and Port Tennant.

The castle, first built by Henry de Newburgh about 1099, has entirely disappeared; but of the new castle, which was probably intended only as a fortified house, there remain the great and lesser halls, a tower and a so-called keep with the curtain wall connecting them, its chief architectural feature being a fine embattled parapet with an arcade of pointed arches in a style similar to that of the episcopal palaces of St. David's and Lamphey built by Henry Gower (d. 1347), bishop of St. David's, to whom the building of the new "castle" is also ascribed. Possibly some traces of St. David's Hospital, built by the same prelate in 1331, are still to be seen at Cross Keys Inn. The parish church of St. Mary was entirely rebuilt in 1895–98. Of the earlier work there remains the door of the rood loft (built into a wall), and a few private memorials. Within the parish of St. Mary was St. John's, a church once owned by the Knights Hospitallers. This church, which was entirely rebuilt in 1820, was renamed St. Matthew in 1880, when a new St. John's was built within its own parish. The Royal Institution of South Wales, founded in 1835, possesses a museum in which the geology, mineralogy, botany, prehistoric and later antiquities of the district are well represented. Its library is rich in historical and scientific works relating to Wales and Welsh industries. The free library and art gallery contains exhibits of local and general Welsh interest. The Glynn Vivian art gallery was opened in 1915.

The grammar school was founded in 1682 by Hugh Gore (1613–1691), bishop of Waterford. A college was added to the University of Wales in 1920, with a site in Singleton Park (300 acres). The town possesses the Llewelyn Park of 42 acres and other public grounds. De Braose's charter of 1305 gave the burgesses the right to take from the lord's woods sufficient timber to make four great ships at a time and as many small vessels as they wished. Coal was even then worked in the district. Cromwell in his charter of 1655 recognized Swansea as "convenient for shipping and resisting foreign invasions." Its status was only that of a "creek" in the port of Cardiff till 1685, when it was made independent.

From about 1768 to 1850 Swansea had a famous pottery. Beginning with earthenware which twenty years later was improved into "opaque china," it produced from 1814 to 1823 superior, beautifully decorated porcelain.

During the 18th century coal began to be worked at Llansamlet and copper smelting (begun at Swansea in 1717, though at Neath it dated from 1584) assumed large proportions. The coal was conveyed on the backs of mules and later by means of a private canal. Under an act of 1791 harbour trustees cleared the river bed and built a long pier on either side of it. A canal connecting the tidal part of the river Neath with the mouth of the Tawe, made in 1789, was in 1824 connected with the Vale of Neath canal by means of an aqueduct across the Neath river, when also a small dock, Port Tennant or Salthouse Dock, was made near the east pier, and this continued to be used till 1880. Meanwhile in 1798 the entire coal producing Swansea Valley was connected with the port by a canal 16½ m. long (acquired by the G.W.R. in 1872). In 1851 the river was diverted eastward into a new channel (called the New Cut) and its old channel was locked and floated, thereby forming the North Dock. (Area 11½ acres, and a half tide basin 2½ acres. Length of quays 5,500 ft.) The Swansea Valley canal has a connecting lock with this dock, and on the island between the dock and the New Cut are patent fuel works, copper ore yards and other mineral sheds. The South Dock, begun in 1847 and opened in 1859, is mainly used for shipping coal and for discharging timber. It has an area of 18½ acres; length of quays 6,550 ft.; depth of water in lock 34 ft. The next development was on the east side of the river where the natural inlet of Fabian's Bay, inside the harbour mouth, was utilized for the construction of the Prince of Wales's Dock (authorized 1874, opened October 1881, and subsequently extended), area 28 acres; length of quay 6,872 ft. and it is connected with the Tennant canal. The very rapid increase in the demand for anthracite coal (for the shipment of which Swansea has practically a monopoly) soon necessitated still further accommodation and in July 1904 was begun the King's Dock, which lies farther east and has an entrance direct from the bay. By means

of the embankment made in connection with it, 400 acres were reclaimed from the sea. King's Dock and Basin is 71 acres; depth of water 40 ft. (high tide); length of quays, 14,050 ft. The Queen's Dock is 150 acres with 2,400 ft of quays. There are numerous privately owned dry docks The entire harbour has some 281 acres of deep water in the docks and over 6 miles of quay. The imports include timber, ores (copper, silver, iron, etc.), grain, pig iron, crude oil, etc. The exports are coal, patent fuel, refined oils, coke, tin plates, etc.

The town (which is often called "the metallurgical capital of Wales") is the chief seat of the copper, spelter, tin-plate and patent fuel industries Copper smelting, which during most of the 19th century was the chief industry, has not maintained its relative importance, though Swansea is still the chief seat of the trade, but three-fourths of the tinplates manufactured in Great Britain and nineteen-twentieths of the spelter or zinc are made in the Swansea district, and its tube works are also very important. From about 1918 Swansea has become an important centre for the distribution of oil and extensive facilities for its storage and refining have been provided. It is by reliance on the metallurgical industries and the facilities for dealing with other fuel besides coal that Swansea has escaped in some measure the depression that has overtaken the purely coal-exporting areas of the South Wales coal-field since the slump of 1921 Trawlers usually land their catches at the south dock, where there is a well organized fish-market.

Administration.—The town claimed to be a borough by prescription, for its only known charters of incorporation are those of Cromwell and James II., which were never acted upon. It probably received its first grant of municipal privileges from William 3rd earl of Warwick some time before 1184. By a charter of 1215 (confirmed in 1234, 1312 and 1332), John granted the burgesses the right of trading, free of all customs due, throughout the whole kingdom (except in London). By 1305 the burgesses had obtained a most liberal grant of privileges from William de Braose. A patent of murage and pavage—from which it may probably be inferred that Swansea was a walled town—was granted by Edward II. in 1317 and another by Edward III. in 1338. Cromwell's charter of 1655 changed the title of portreeve into mayor, in whom, with twelve aldermen and twelve capital burgesses, it vested the government of the town. Four annual fairs were appointed, namely on the 8th of May, 2nd of July, 15th of August and 8th of October—the first being the only new one.

From 1535 to 1832, Swansea with other boroughs of Glamorgan sent one member to Parliament. In 1658, Cromwell gave Swansea a member of her own but the grant lapsed with the Restoration. In 1832, Swansea, with added parishes, was again granted a member and in 1885 a second member was added. The assizes and quarter sessions for Glamorgan are held at Swansea alternately with Cardiff The borough has a separate commission of the peace, and, since 1891, a court of quarter sessions.

In 1923 the "Church in Wales" created a bishopric of Swansea and Brecon

SWANWICK, ANNA (1813–1899), English writer and philanthropist, was born at Liverpool on June 22, 1813. She went in 1839 to Berlin, where she took lessons in German, Greek and Hebrew. In 1843 appeared her first volume of translations, *Selections from the Dramas of Goethe and Schiller,* followed by a translation of Schiller's *Jungfrau von Orleans* (1847), and others of *Faust, Tasso, Iphigenie* and *Egmont* (1850). In 1878 she published a complete translation of both parts of *Faust,* which appeared with Retsch's illustrations. In 1865 she published a blank verse translation of Aeschylus's *Trilogy,* and in 1873, a complete edition of Aeschylus, which appeared with Flaxman's illustrations. Anna Swanwick was a founder of Queen's and Bedford colleges, and advocated the admission of women to universities. She died in Nov. 1899. *See* M. L Bruce, *Anna Swanwick* (1903).

SWARAJIST. The term *swaraj* (more properly *swarajya* from *swa*=own or self; *rajya*=rule or government) was originally employed in the ethical sense of control over self—self mastery. Prominence was first given to it in the political arena by Dadabhai Naoroji, who, in his presidential address to the Indian National Congress in Calcutta in Dec. 1906 claimed as the right of India *swaraj* "or self government like that of the United Kingdom or the Colonies," and the word soon gained currency as the equivalent of Dominion home rule. By a judicial decision of the Calcutta high court (1907, I.L.R., 34 Calc.), it was held not necessarily to mean "independent government" in the sense of government of the country to the exclusion of the present Government. "It may mean, as is now well understood, government by the people themselves under the King and under British sovereignty." Its adoption as the label of a particular political party was the outcome of the lengthy and ever-changing agitation set on foot by M. K. Gandhi in 1919. That movement commenced as one of passive resistance to the legislation known as the Rowlatt Act, which was designed to strengthen the hands of the Government in dealing with revolutionary crime, but, utilizing the resentment aroused among Mohammedans by the Turkish peace terms, which crystallized in the Khilafat movement, and the excitement which ran through the country as the result of disturbances in the Punjab and their sequelae, Gandhi, in the succeeding year, launched a campaign of protest under the guise of non-violent non-cooperation, which was to include the boycott of the courts and Government schools, the resignation of titles and Government office, and abstention from participation in the forthcoming elections to the new legislative councils under the Reforms scheme. In July 1920 the attainment of *swaraj* was included among the objects of the non-co-operation movement, and at the meeting of that year it was adopted by the Indian national congress as their avowed aim. But as to the precise meaning of *swaraj* there existed a vagueness which Gandhi did little to dispel. At one time he defined it as parliamentary government, whether within or without the empire; at another as dominion home rule; at a third as the universal employment of the spinning wheel; yet again as the triumph of the Khilafat party On the other hand, at the first meeting of the legislative assembly in Feb 1921, in the message from His Majesty the King Emperor, the ideal of *swaraj* was mentioned as the dream for years of patriotic and loyal Indians, while the reforms were cited as the beginnings of *swaraj* within the empire.

In the first elections under the 1919 act Gandhi's followers took no part, but by the beginning of 1922, an influential section of the congress acting under the leadership of C. R. Das and Pandit Moti Lal Nehru, announced on Jan 1, 1923, the formation of a Congress Khilafat Swarajya party, in whose programme the capture of the councils and the obstruction of all business in them was the leading immediate item. After protracted dissensions and manoeuvres this section was finally victorious within the congress, and at the elections of Nov. 1923 Swarajist candidates took the field as such and, noticeably as against the Moderates, achieved considerable success, though failing to secure (except in one province) the clear majority for which they had hoped Throughout the term of the second reformed councils the Swaraj party continued their wrecking tactics, succeeding in two provinces (Bengal and the Central Provinces) in bringing about a temporary suspension of the reformed constitution.

Towards the end of that year the party was split by the defections of some of its members, notably in Bombay and the Central Provinces, in the direction of "responsive co-operation," including the acceptance of office under Government, and in April 1926 an attempt was made to form an Indian national party of responsivists, independents and moderates "to prepare for and accelerate the establishment of *swaraj* or full responsible government in India, such as obtains in the self-governing dominions of the British empire." These differences bore fruit at the third election of the reformed councils at the end of 1926, when the Swaraj party definitely lost ground, noticeably in the assembly and in the United Provinces, Punjab and Central Provinces. The Indian national congress (which by that time was practically the Swaraj party) in Dec. 1927, declared for the complete independence of India

SWARTHMORE, a borough of Delaware county, Pennsylvania, U.S.A., among wooded hills near the Delaware river, 11 m. S.W. of Philadelphia. Pop. (1920) 2,350; 1928 estimate, over 3,000. Swarthmore college, founded by the Society of Friends in 1864, has a beautiful campus of 237 ac. (including a large

tract of woodland and the rocky valley of Crum creek), upwards of 20 buildings and an endowment of $3,500,000. The enrolment is limited to 500. Swarthmore was incorporated in 1893.

SWASTIKA, a decorative and symbolic ornament consisting of a cross with equal arms, to the end of each of which is attached a line running at right angles to it, all these extensions occurring on the same relative side, so that all four extensions have the same rotary direction in relation to the centre. The swastika is one of the most ancient and widespread of all ornamental forms, appearing in both hemispheres. It is generally interpreted as a sun symbol. It occurs in Aegean and archaic Greek pottery and in certain types of fret, found in Egypt and Greece. In some examples it appears as two identical S-curves, intersecting in the middle and set at right angles. Occasionally three arms are found, and the heraldic symbol of three running legs set radially, may be a development of the swastika.

(T. F. H.)

SWAT, a tract on the Peshawar border of the North-West Frontier Province of India, consisting of the valley of the Swat river above its confluence with the Panjkora, which is reached by the Malakand, the Shahkot and other passes from the south.

The Swat river rises in the Kohistan, not far from the source of the Gilgit river and is utilized by canals to irrigate about 160,000 acres. A tunnel through the Malakand range, when complete, will tap the river much higher up.

The old name of the river was Suastos, and that of the Panjkora was Ghoura, under which names they figure in the history of Alexander's campaign. Only the lower portion of the Swat valley is of military significance. The upper valley is closely gripped between mountain spurs of the Hindu Kush. The valley, narrow though it is, and traversed by the worst conceivable type of hill tracks, is fairly thickly populated. The district lies on the direct road to Chitral.

The Swatis are a clan of Yusafzai Pathans numbering 40,000 fighting men but are of poor physique, due to malaria. They are Suni Mohammedans, the most bigoted of all the Afghan tribes. As religious leader, the Akhund of Swat, Abdul Ghafur, born in 1794, ruled for the last 30 years of his life, and died in 1877. The Akhund, after his experience of the British strength in the Umbeyla Campaign of 1863, always exerted his influence in favour of peace with the British government. He was succeeded by his son Mian Gul, who never possessed the same influence as his father.

SWATH-TURNER: *see* CULTIVATING MACHINERY.

SWATOW (also SHAN'TOW), a port in the province of Kwang-tung, China, situated at the mouth of the main branch of the Han river. Population about 80,000 (estimated). It was formerly a small fishing village, and the present town has been built to a large extent on reclaimed land. English merchants settled on Double island, in the river, as early as 1856, and began trading. Swatow is a great emigration port and was the scene of many kidnapping adventures on the part of foreigners in the early days. The region retained a full tribal organization until the latter half of the 19th century. Serious difficulties arose with the T'aip'ing rebellion and foreign interferences. The city is the outlet for Chao-chow, some 30 m. up the river, and the centre of a sugar cane district. Bean cake is manufactured and is also imported from Niuchwang, Shanghai and Hongkong. Among the leading exports are tea (since about 1872), sugar and oranges, paper, tobacco, grass cloth (manufactured at Swatow from the so-called Taiwan hemp), lace, drawn thread work embroidery. The imports include cereals, peas, beans, kerosene oil and piece goods. The port was opened to foreign trade in 1869. By its situation at the southern end of Formosa strait the town is exposed to the full force of the typhoons.

SWAYTHLING, SAMUEL MONTAGU, 1ST BARON (1832–1911), British financier, was born at Liverpool on Dec. 21, 1832, of a Jewish family named Samuel. He took by royal licence the name of Montagu. He rose to be the head of the most important arbitrage house in London. He was Liberal M.P. for the Tower Hamlets from 1885–1900; he was a member of the Gold and Silver commission of 1887–1890, being himself a bimetallist. He was created a baronet in 1894 and raised to the peerage in 1907. He was a zealous promoter of Jewish interests, founding the loan fund of the Jewish board of guardians, the Jewish working men's club, and several synagogues. Lord Swaythling succeeded Sir Julian Goldsmid as chairman of the Russo-Jewish committee, and also helped to establish a modern secular school for Jews at Jerusalem (1875). He died on Jan. 12, 1911, in London. His son, E. S. Montagu was Secretary for India.

SWAZI. This African tribe is a member of the Eastern or Zulu-Xosa group and, in the early 19th century, occupied the country north of the Pongelo river. Driven northwards it settled under Sobhuza in Swaziland (Natal). Mbandini—second in succession to Sobhuza—was generous in concessions, and though the independence of Swaziland was guaranteed by Conventions in 1881 and 1884, developments led to the administration of Swaziland under the High Commissioner for South Africa through a Resident, with a Council to advise on purely European matters. The paramount chief and other chiefs, administer justice according to native custom, with appeal to the Resident. The recovery from the ravages of rinderpest in 1894 has been very marked.

Both levirate and sororate seem to exist and a man may marry the daughter of his wife's brother. Under conditions, his son, as cousin, may inherit the right to marry the girl.

See the *Official Yearbook of the Union of South Africa,* No. 9 (1927); *see* also *Africa,* Vol. I., No. 4 (1928), H.M. Stationery Office.

SWAZILAND extends between the Drakenberg and the Lebombo range. It is cut off from the Indian ocean by a strip of country from 30 to 50 m. broad. Its area is 6,705 sq. miles.

Much of the country consists of ridges of high land running out from the Drakenberg. In the west, the general elevation is about 4,000 feet. In the east, the ground falls to 400–1,000 feet. Swaziland is drained by the Usutu and other tributaries of the Maputa; and by the Komati (*q.v.*) and Umbelezi which flow through watergaps or poorts into Delagoa bay.

The low veld, in the rain shadow of the Lebombo range, has a low rainfall, but on the high veld in the west, rains are more copious and good pasture is present. The relation of altitude to mean annual rainfall is Mbabane (3,800ft.) 52 in.; Bremersdorp (1,500ft.) 34 in.; Natalia Ranch (800ft.) 25 inches. The mean temperature at the last station is about 71·8° F; at Mbabane it is about 9° less. The flora and fauna are similar to the Transvaal and Zululand (*q.v.*). The high veld is free from malaria, which occurs elsewhere, especially in the low veld. Swaziland is dependent on road transport, which is either motor-driven or drawn by oxen or mules. Mbabane, the capital, is 5 hr. by mail car from Breyten, in the Transvaal.

The population in 1921 consisted of 2,205 Europeans, seven Asiatics, 444 coloured persons, and 110,295 natives. There are four European villages—Mbabane (260), Bremersdorp (120), Hlatikulu and Goedgegen, and there are Government stations at Mankaiana, Stegi and Pigg's Peak. Most of the Europeans are engaged in farming. The natives are Amaswazi, with a few Amazulu in the south-eastern districts. Seven or eight thousand natives are usually absent, working in the Transvaal.

Of the total area, 163,500 ac. were set aside as native reserves, and the Amaswazi purchased a further 77,000 acres. The rest of the country was regarded as Crown land, and about four-fifths of it has been alienated.

The natives grow maize, Kafir corn and other crops. In 1926 the estimated numbers of live stock were 300,000 cattle, 932 horses, 4,893 asses, 444 mules, 10,000 pigs, 325,000 sheep and goats. A further 300,000 sheep come every year to winter in Swaziland. Maize is also cultivated by the white farmers. The country appears to be well suited to fruit growing. Citrus fruits do well in most parts; on the high veld apples, pears, apricots and peaches can be grown, while in the lower parts tropical and sub-tropical fruits succeed. In 1924 about 8,000 ac. were under cotton. Tobacco is also being grown. The chief market is among the natives, whose wants, however, are few, except for maize.

Gold mining has almost ceased. In 1926 only 1,510 oz. were produced. Cassiterite is worked near Mbabane, the output for 1926 being 189 tons. In 1910 Swaziland came into the customs scheme of the Union of South Africa.

Swaziland does not form part of the Union of South Africa. It is governed by a resident commissioner, responsible to the high commissioner for South Africa. He is assisted by an advisory council of nine members, who are consulted on European matters. Most of the revenue is derived from the native hut tax and from customs.

In addition to several Government primary schools at several centres, there are schools connected with the various missions, at which over 4,000 native pupils are being educated. For more advanced work, promising native scholars are sent to institutions in the Union, such as Lovedale, Tiger Kloof, etc. The cost of their tuition and board is paid by the Swazi National Fund, to which each native taxpayer contributes two shillings per annum. There are 16 religious bodies carrying on work in the country, including the English, Dutch, Norwegian, Roman and Swedish Churches. As far as possible most of these bodies avoid encroaching on each other's sphere of work. (R. U. S.)

History.—Ama-Swazi tribes have been long settled in the country now known as Swaziland. They were formerly called Ba-Rapuza or Barabuza after a chief under whom in the 18th century they acquired homogeneity. Early in the 19th century they fell under the dominion of the newly constituted Zulu nation but in 1843 under a chief named Swazi they achieved independence. According to custom they adopted the name of their deliverer The Boers of the Transvaal were then beginning to occupy the regions adjacent to Swaziland and in 1855 the Swazi in order to get neutral territory between themselves and the Zulu, whose power they still dreaded, ceded to the Boers the narrow strip of land north of the Pongola river now known as the Piet Retief district. With the Boers the Swazi remained on friendly terms and this friendship was extended to the British on the occupation of the Transvaal in 1877. In 1879 they joined the British in the attack on the Bapedi chief Sikukuni, capturing from him certain "rain medicine," the possession of which increased the prestige of the paramount chief of the Swazi among the natives of South Africa.

On the retrocession of the Transvaal in 1881 and again by the London Convention of 1884, the independence of the Swazi was recognized by the Boers. Immediately afterwards, however, the Boers began a series of efforts to obtain control of the country. In consequence Umbandine (Mbandini), the paramount chief asked in 1886 for British protection, but without avail. In 1887 gold prospectors of all nationalities were overrunning his country, and a colony of Boers settled within the Swazi territories and proclaimed "The Little Free State." It appeared on enquiry that Umbandine, a worthless and bibulous man, had granted concessions, such as "postal, telegraphic, banking, customs," etc., to the Transvaal, and concessions of land, mining and grazing rights to any adventurer who would give him champagne and greyhounds. His concessions included exemption from taxation The British Government refused assent to the request of President Kruger to annex the country to the Transvaal and a dual control was arranged in 1890. This scheme proved abortive owing to the objection of the Transvaal to join the South African Customs union. However, in 1894, by arrangement with the British, the administration, with certain reservations as to the rights of the natives, was taken over by the Transvaal. In seeking to acquire Swaziland President Kruger's main object was also to annex the coast lands to its east and thus obtain for the Boers—at Kosi bay—a seaport of their own. Great Britain settled the matter in 1895 by annexing Amatongaland, the region in question. (*See* TRANSVAAL, *History*.)

Umbandine died in 1889, and his widow Naba Tsibeni (or Labotsibeni) was known as the queen regent. Before the Anglo-Boer war in 1899 she took the side of the British. On the cessation of hostilities a British special commissioner was sent into the country—then in a condition bordering on anarchy—and a provisional administration established. Eventually it was decided, in 1906, to make Swaziland a British protectorate under the High Commissioner for South Africa. In that year a lad, Sobhuza II, born about 1898, was selected as ruler, Naba Tsibeni, his grandmother, being confirmed as regent during his minority. In 1921 Sobhuza was installed as paramount chief; Naba Tsibeni died in Dec. 1925. She was a fine type of the older generation; Sobhuza was educated at the Lovedale missionary establishment; speaking fluent English and wearing European clothing, he was typical of many Swazi of the new school.

A legal division of the land in 1914 between the natives and the concessionaires left fully half of it in possession of Europeans. The Swazi, however, claimed overlordship and it was not until April 1926 that the judicial committee of the privy council decided that the Crown had acquired sovereign rights of disposal. In 1924 Gen. Hertzog, as prime minister, desired to incorporate Swaziland in the Union. The Swazi objected; the white settlers favoured the proposal only if the separate entity of the country was preserved and up to 1929 nothing had been done. To the able administration of De Symons Honey, Swaziland owed much.

See the *Official Year Book of the Union of South Africa* (Pretoria); the annual *Report on Swaziland*, issued by the Colonial Office, London; and Eric A. Walker, *A History of South Africa* and authorities there cited. (F. R. C.)

SWEARING. The common use of the word is for the uttering of profane oaths or curses. In English law, while blasphemy (*q.v.*) was at common law an indictable offence, cursing or swearing was left to the ecclesiastical courts. The Profane Oaths Act 1745 inflicted a sliding scale of fines for the use of profane oaths according to the rank of the offender: 1s. for a common labourer, soldier or seaman, 2s for everyone below the rank of gentleman and 5s. for those of or above that rank; procedure under this Act is regulated by the Summary Jurisdiction Acts By the Town Police Clauses Act 1847 the use of profane or obscene language is an offence punishable on summary conviction by a fine not exceeding 40s. or imprisonment not exceeding 14 days. The offence must be committed in a street. In the United States, blasphemy is a crime under either the common law or the statutes of substantially all of the States

SWEATER, a jacket or short coat of a woollen material, usually knitted, and sometimes called a jersey, because it was worn by the sailors of the Island of Jersey. The first sweaters were heavy dark blue jackets, which were pulled on over the head, and were worn by the participants in athletic contests before and after games, to prevent cold.

SWEATING-SICKNESS, a disease which made its first appearance in England in 1485. It caused great mortality and was distinguished from the plague and other epidemic diseases by its rapid course.

From 1485 nothing more was heard of it till 1507, when the second outbreak occurred, which was much less fatal than the first. In 1517 was a third and much more severe epidemic In Oxford and Cambridge it was very fatal, as well as in other towns, where in some cases half the population are said to have perished The disease spread to Calais and Antwerp, but with these exceptions it was confined to England.

In 1528 the disease recurred for the fourth time, and with great severity. It first showed itself in London at the end of May, and speedily spread over the whole of England, though not into Scotland or Ireland. In London the mortality was very great; the court was broken up, and Henry VIII. left London, frequently changing his residence. It spread to the Continent, suddenly appearing at Hamburg, where in a few weeks more than a thousand persons died

It caused fearful mortality through northern and eastern Europe, France, Italy and the southern countries were spared. It spread much in the same way as cholera. In a given place, it prevailed for generally not more than a fortnight. By the end of the year it had entirely disappeared, except in eastern Switzerland, where it lingered into the next year; and the terrible "English sweat" has to date never appeared again, at least in the same form, on the Continent. In 1551, however, it recurred in England and was described by an eye-witness, John Kaye or Caius, the eminent physician.

The disease began suddenly with a sense of apprehension, followed by cold shivers (sometimes very violent), giddiness, headache and severe pains in the neck, shoulders and limbs, with great prostration. After the cold stage, which might last

from half-an-hour to three hours, followed the stage of heat and sweating. The characteristic sweat broke out suddenly, and, as it seemed to those accustomed to the disease, without any obvious cause. With the sweat, or after that was poured out, came a sense of heat, and with this headache and delirium, rapid pulse and intense thirst. Palpitation and pain in the heart were frequent symptoms. No eruption of any kind on the skin was generally observed; Caius makes no allusion to such a symptom. In the later stages there was either general prostration and collapse, or an irresistible tendency to sleep, which was thought to be fatal if the patient were permitted to give way to it. The malady was remarkably rapid in its course, being sometimes fatal even in two or three hours, and some patients died in less than that time. Those who survived for twenty-four hours were considered safe.

The disease, unlike the plague, was not especially fatal to the poor, but rather, as Caius affirms, attacked the richer sort.

Causes.—Some attributed the disease to the English climate, its moisture and fogs, or to the intemperate habits of the English people, and to the frightful want of cleanliness in their houses and surroundings which is noticed by Erasmus in a well-known passage, and about which Caius is equally explicit. But the sweating-sickness was in fact a specific infective disease, in the same sense as plague, typhus, scarlatina or malaria.

The only modern disease resembling sweating-sickness is that known as *miliary fever* ("Schweissfriesel," "suette miliaire" or the "Picardy sweat"), a malady which has been observed in France, Italy and southern Germany, but not in the United Kingdom. It occurs in limited epidemics, not lasting more than a week or two (at least in an intense form). The attack lasts longer than the sweating-sickness, is accompanied by eruption of vesicles, and is not usually fatal. The first clearly described epidemic was in 1718 (though probably it existed before), and the last in 1861. Between these dates about 175 epidemics have been counted in France alone.

Bibliography.—For history *see* Bacon's *Life of Henry VII.*, and the chronicles of Grafton, Holinshed, Baker, Fabyan, etc. The only English medical account is that of John Caius, who wrote in English *A Boke or Counseill Against the Disease commonly called the Sweate, or Sweating Sicknesse* (London, 1552); and in Latin *De ephemera britannica* (Louvain, 1556; reprinted London, 1721). The English tract is reprinted in Babington's translation of Hecker's *Epidemics of the Middle Ages* (Syd. Soc., 1844). This also contains Hecker's valuable treatise on the English sweat, published in German (1834), and also printed in his *Volkskrankheiten des Mittelalters*, edited by Hirsch (Berlin, 1865). Grüner's *Scriptores de sudore anglico* (Jena, 1847), contains nearly all the original documents, including the two treatises of Caius. *See* also Hirsch, *Handbook of Geographical and Historical Pathology*, trans. by Creighton (New Syd. Soc., 1885).

SWEATING SYSTEM, a term used to describe oppressive industrial conditions in certain trades. This "system" originated early in the 19th century, when it was known as "the contract system." Contractors supplying the government with clothing for the army and navy got the work done by sub-contractors. Afterwards this plan was adopted in the manufacture of ready-made clothing for civilian use, and of "bespoke" garments (made to the order of the customer). Previously the practice had been for coats, etc., to be made up by workmen directly employed by the master tailor. The new plan brought workpeople possessing little skill and belonging to a very needy class into competition with the regular craftsmen; and a fall in wages affected the whole body of workmen in the trade.

The work was done in overcrowded and insanitary rooms, and the earnings of the workers were extremely low. In 1850 a vigorous agitation against "the sweating system" was commenced, based mainly upon a series of articles in the *Morning Chronicle* (London), which were followed by a pamphlet, *Cheap Clothes and Nasty*, written by Charles Kingsley under the name of "Parson Lot," and by his novel *Alton Locke*. Kingsley and his friends, the Christian Socialists, proposed co-operative workshops; but experiments met with little success. In 1876–1877 the outcry against the sweating system was renewed (principally on the ground of the risk of infection from garments made up in insanitary surroundings), and in 1887, attention was drawn to the immigration of poor foreigners into East London, who were employed in tailoring, boot-making and cabinet-making. A select committee of the House of Lords heard 291 witnesses in relation to tailoring, boot-making, furriery, shirt-making, mantle-making, cabinet-making and upholstery, cutlery and hardware manufacture, chain and nail-making, military accoutrements, saddlery and harness-making and dock labour—reporting in 1890. Sweating involved "(1) A rate of wages inadequate to the necessities of the workers or disproportionate to the work done; (2) excessive hours of labour; (3) the insanitary state of the houses in which the work is carried on." They stated that, "as a rule, the observations made with respect to sweating apply, in the main, to unskilled or only partially skilled workers, as the thoroughly skilled workers can almost always obtain adequate wages."

It would be a mistake to suppose that "sweating" never took place where no "middlemen" were employed. "Sweating" was sometimes to be found in large factories where workers were directly employed.

The plight of the homeworkers, most of whom were women, may be easily imagined. Compelled to work, either to eke out an insufficient family income or to support her own isolated existence, but normally unable to leave her home, such a woman had no alternative but to accept wages at the wretched level to which they had sunk as the result of unfettered competition and of the inability of the workers to act collectively.

The position of the worker employed by the small sub-contractor was little better. On the one hand there was keen competition amongst the "middlemen," which led them to accept sub-contracts at prices which often made it impossible for them to pay more than a meagre wage. On the other hand the sub-divisional methods of manufacture which were then beginning to be widely adopted drew into various trades which had previously been closed to them, a large number of comparatively unskilled and inexperienced workers, who knew nothing of the tradition which had maintained organisation and standard rates of wages amongst the skilled workers by whom the work of the trade had previously been done. The organisation of the employees of the small sub-contractors presented insurmountable difficulties. They worked in small, scattered groups; their employers were unstable and their employment erratic.

When, moreover, trade was brisk extremely long hours would be worked in seriously overcrowded workrooms. On the other hand, when trade was slack the sub-contractor, whose overhead charges did not, of course, compare with those of the factory employer, found it perfectly practicable to dismiss as many workers as he could do without—a facility which encouraged inefficient organisation of work in the trades which enjoyed it.

The workers toiled during night and day. Work-room, living-room and bedroom were often all one. The laws concerned with hours of employment and the conditions, from the point of view of health, were very difficult of enforcement.

Such were the conditions at the beginning of the present century in a number of trades. In 1929 while there may still be "pockets" of "sweating" in a very few trades the evil is unknown. To this result two main factors have contributed: first the fixing of statutory minimum rates of wages in the "sweated" trades and in those trades in which organisation of employers and workers was insufficient for wages and conditions to be negotiated in the ordinary way; and secondly the constantly increasing economies of factory production. (*See* Trade Boards.)

The rapid development of factory organisation and the employment of expensive, high-speed machinery on sub-divisional methods of production militated against the giving out of work either to homeworkers or to small sub-contractors. Despite the fact that "outwork" saves the employer considerable overhead charges such as rent, rates, heating and interest on capital sunk in buildings and machinery, it becomes less and less able to compete with the well-equipped and efficiently organised factory. And where there is a trade board it cannot any longer flourish on low wages. It may be that the widespread use of electric power may bring about a revival of the small workshop in those trades which can be carried on with comparatively small and inexpensive machinery. (J. J. M.)

THE UNITED STATES

The sweating system arose in the United States during the Civil War, when soldiers' wives were given uniforms to make with the then newly invented sewing machines. Its growth was slow until, in the '80s, the vast Russian emigration followed the assassination of Czar Alexander II. Steam-power had already been applied to sewing machines, and the influx of cheap labour created the American ready-to-wear garment trade and its early concomitant, the sweating system.

Three elements compose the sweating system: (1) A mass of unskilled, unorganized poverty-stricken men, women and children incapable of resisting the economic pressure to compete, women against their husbands and children against their parents. (2) Power-using factories or shops, where materials are prepared for simple processes, which are done in smaller shops or in the homes of the workers, or in both. (3) Transportation to and from the sweatshops and tenement dwellings, formerly done on foot by heavily laden men, women and children. During the present century automobile trucks and the parcel post have contributed to widen enormously the area within which the sweating system is carried on, and to reduce the crowding of slums adjacent to factories engaged in the sweated trades.

As the first simple foot-power sewing machine brought the sweating system to the soldiers' families, so the ceaseless evolution of the power-driven machine, first steam, now electric, has served to concentrate the production of garments in vast sky-scrapers near railway stations through which the employees go to their widely dispersed homes This concentration has, in recent decades, so facilitated labour organization within the garment industry, that the Amalgamated Garment Workers now owns its building, its bank, journal, blocks of modern apartments, and voluntary unemployment insurance fund, the last being carried on co-operatively by employers and employees. They successfully combat both sweating and strikes.

Outside the garment trades, also, the unions have striven ceaselessly against sweating. In 1889 the tobacco workers obtained the passage of the New York statute forbidding all manufacture of tobacco in any tenement house. This the Court of Appeals of New York held unconstitutional, so prolonging for two generations homework in tenements.

Beginning in 1912, in Massachusetts, 13 States passed laws creating minimum wage boards or commissions These the Supreme Court of the United States, in the Sutherland decision, held unconstitutional by a decision of five justices to four, rendered in April 1923.

There remain now two means of control. Legislation in the name of the public safety may be resorted to, as when a man killed himself and his little son in making fire crackers in his home, for a Fourth of July celebration. So, too, the local health authority could summarily stop a young girl found suffering from an open syphilitic infection of the hands from making, in her home, powder puffs for babies. (F. KE.)

SWEDEN (*Sverige*), a kingdom of northern Europe, occupying a part of the Scandinavian peninsula. The length is about 990 m., the extreme breadth (mainland) about 250 m., and the total area, inclusive of inland waters, of which the four great southern lakes comprise 3,510 sq m., is estimated at 173,154 sq.m. Strelbitsky estimated the boundary at 6,100 m.; 4,737 m. are coastal, the Norwegian frontier is 1,030 m., and the Finnish 333 miles.

Physical Features.—The backbone of Sweden is an ancient mountain range of which the crest line forms the Norwegian boundary. The three main territorial divisions of Sweden are Norrland, Svealand and Götaland. The country may be described in four main physical divisions:—the northern mountains and lake region district, covering all Norrland and the western part of Svealand; the lowlands of central Sweden; the Småland highlands, in the south and south-east; and the plains of Skåne, occupying the extreme south of the peninsula. The first district is much the largest and highest, and contains the finest scenery. The greatest heights lie along the boundary and several exceed 6,000 ft. Kebnekaise (6,965 ft.) formerly considered the highest point in Sweden, is a bold, somewhat isolated summit. Slightly south, beyond the Lule älf, is a lofty mass in which Sarjektjåkko (6,971 ft.) slightly overtops the other summits. Still farther south is the better-known Sulitjälma (6,158 ft.); beyond is a progressive decrease in height southwards until Åreskutan (4,656 ft) is reached. Near the southern flanks of Åreskutan the railway from Trondhjem (Norway) crosses into Sweden. South of the railway the highland line passes into Norway, but before doing so the mass rises into such heights as Helagsfjäll (5,896 ft.). Here the snow line, which is about 3,000 ft. in the north, rises to 5,500 ft. The numerous rivers are linked with long, narrow, high-level (900–1,300 ft.) lakes, due mainly to dams of moraine Amongst European countries only Finland exceeds Sweden in the number of its lakes. In Sweden they cover over 14,500 sq.m. (about 8% of the country), but the largest lie in the central lowlands. The northern rivers run through forests and enter the sea usually through long estuaries. The Torne, which, with its tributary the Muonio, forms the boundary with Finland, has a length of 227 m., and drains Torneträsk (126 sq m.). Along and near to the shores of the lake the railway from Gellivare runs to Narvik (Norway). The Kalix (208 m.), with numerous rapids, is paralleled by the Lule, whose main stream is 193 miles. One of its branches, the Stora Lule drains the Langasjaur and Luletrask, which together have a length exceeding 50 m. but a total area of only 87 sq. miles Just below Stora Lule lake is the Harspräng (hare's leap, Njuommelsaska of the Lapps), the largest and one of the finest cataracts in Europe. At the head of the Langasjaur is the Stora Sjöfall (great lake fall; Lapp, Àtna Muorki Kartje), 130 ft. In the southern mountain valleys of the region there are several beautiful falls, such as the Tännfors, not far from Åreskutan. Still farther south of the Lule are the Pite river (191 m) and the Skellefte (205 m)—the latter drains Hornafvan and Storafvan (total area 275 sq m.) Hornafvan is a straight and sombre trough, but Storafvan and the intervening Uddjaur are broad and picturesquely studded with numerous islets. The Ume (237 m) with its tributary, the Vindel, of almost equal length, drains several lakes, including Stor Uman (64 sq. miles). The further principal rivers of this region are the Ångerman (279 m.) with the magnificent Hällingså fall within its drainage area, Indal (196 m) and Ljusnan (230 miles). The Dal (320 m) embraces Lake Siljan (110 sq. miles). The Klar has its upper waters—the Faemund—in Norway and reaches Lake Vener after a course of 228 miles The Torne has a drainage area of nearly 17,000 sq m. but the Ångerman has the largest basin (over 12,500 sq m.) of any river entirely in Sweden; the average for the other large northern streams is less than 8,000 sq. miles. The northern rivers are liable to flooding so serious that they change their courses

The lowlands resemble the coastal belt Here are fertile plains of clay, with innumerable lakes, including Vener, Vetter, Mälar and Hjelmar with areas respectively 2,141, 733, 444 and 185 sq. miles. The scenery is quietly beautiful, especially of Mälar, in the pleasant environs of the city of Stockholm. Granulite, also called eurite and halleflinta, is the most important of the Archaean formations and contains all the metalliferous deposits of Sweden. The rock is a very compact and fine-grained mixture of felspar, quartz and mica, often grading into mica schist, quartzite and gneiss. The Cambrian and Ordovician strata occur in isolated patches. The deposits in most places are very little disturbed and form horizontal or slightly inclined layers. South of Vener they are capped by thick beds of eruptive diabase. Conspicuous local features are the eskers, or gravel-ridges (*åsar*) 100 to 200 ft. in height, in direction north-north-west Their practical value lies in their excellent water supply and gravel South of the central lowlands the Småland highlands lie in the heart of Götaland and are a detached part of highland Sweden. They lie roughly south of Vetter and reach the south-west coast. The general elevation of this region exceeds 300 ft., and in the eastern part 600 ft.; the principal heights are Tomtabacken (1,105 ft.) and Galtåsen (1,188 feet). There is much coniferous forest, but agriculture is profitable. The Småland highlands abut southward upon the plains of Skåne. Newer rocks of Cretaceous and Jurassic ages, together with recent marine deposits, have

TOWNS AND WATERWAYS OF SWEDEN

1. The cathedral church (13th century) of St. Mary at Visby, on the island of Gotland. Visby, a very old port, reached its greatest prosperity in the days of the Hanseatic League.
2. Duved, a tourist resort in Jemtlands Län, which forms a convenient centre for the magnificent mountain and lake scenery of the Swedish-Norwegian border
3. Locks at Trollhättan on the Götha canal (1810–1832), which with its Trollhätte canal extension (1838–1844) and intermediate lakes connects Gothenburg and Stockholm. These waterways make use of numerous rivers; hence of the entire 360 miles route less than 60 miles have been artificially constructed; in all, there are 74 locks
4. The business centre of Gothenburg, principal seaport and second city of Sweden, situated 5 miles from the outlet of the river Götha
5. Stockholm, showing the Riddarholmen (noble's island), the oldest portion of the city. Sweden's capital was founded in the 13th century as a fortified port and has subsequently extended over numerous islands connected with one another and with the mainland by a network of bridges; hence its claim to the title, "Venice of the North"

yielded level plains, with rich open meadows and cultivated lands, the monotony of which is in some parts relieved by beech woods. The Triassic formation (Rhaetic) in the northern part of Malmöhus consists of sandstones and clay beds with coal.

On the whole the rivers of south Sweden are few and short. Lake Vener is drained to the Kattegat by the short Göta river, on which, near the lake, are the celebrated falls of Trollhättan.

Coast.—The coast of Sweden, though not indented with so many or so deep fjords as that of Norway, yet resembles it in having a fringe of islands which, throughout nearly the entire length, shelters the coast of the mainland from the open sea. This *skärgård* is only interrupted round the southern shore off Skåne. Between the *skärgård* and the mainland lies a connected series of navigable sounds of advantage to coastwise traffic.

The island belt is widest (45 m.) off the city of Stockholm (noted for its beautiful sea approach). Farther north, only the narrow Ålands Haf lies between the Swedish coast and the vast Åland archipelago, which extends to Finland. The *skärgård* islands as a whole are rugged and picturesque; in the Baltic several are well wooded, but the majority, particularly in the Gulf of Bothnia, are bare or heath-clad. For the large islands Öland and Gotland *see* separate articles.

Climate.—Several factors contribute towards variations of climate in Sweden's several regions. The land runs through more than 13½° of latitude; about 15% of its area is within the Arctic Circle; the boundary mountains are sufficiently high to be much colder than the adjacent coastal lands, but are not high enough to shut out entirely the warming effects of those drifts of wind and water from the south-west which give Norway its remarkable climate; the eastern and southern borders are washed by the sea; the piercing winter winds from the great Russian pool of cooled atmosphere can sweep westwards over the Swedish lowlands or can reach the mountain tops which, on the whole, offer but moderate gradients for ascents. February is the coldest month and has a mean temperature of below 32° F over Sweden. Stockholm averages 25·7°, Göteborg 30·4°, Haparanda 10·6°, but the coldest region is in the heart of Lappland; here the average for Karesuando is 5·2°. In some northern parts frost occurs in every month of the year, and at Karesuando only five months have a mean temperature above freezing point. July is generally the warmest month. Göteborg has a July mean of 62·2°; Stockholm of 62°; Haparanda, 59° and Karesuando 54·2°. The summer is short but high maxima are sometimes recorded; *e.g.*, 88° at Karasjok in Lappland.

The relative length of the seasons shows contrasts resembling those of temperature. At Karesuando the last day-frost of spring occurs on an average on June 15, and the first of autumn on Aug. 27, while at Stockholm four and a half months, and at Hven in the Sound more than six months are frostless. Ice forms in October in the north and breaks up in May or June, while in the midlands and south the corresponding months are late November and April. The ice-covering of the lakes ranges from 100 days annually in the south to upwards of 200 days in the north, though local increases of the ice period occur in the upper Småland highlands. Drifting sea-ice generally appears in the Kattegat in January; but the Sound becomes obstructed later largely by drift ice from the Baltic. In exceptional winters, *e.g.*, 1916–17, the Sound may be completely frozen over. Ice conditions in the Baltic vary considerably from year to year but usually navigation in the southern part of the Gulf of Bothnia is impeded from the end of November to the beginning of May, and in the north the gulf is covered with ice from November to mid-May, but among the islands it may linger until June.

The length of the Swedish summer day varies between wide limits. At Karesuando in 68° 26′ N. the sun is continuously above the horizon from May 26 to July 18; at Haparanda for 23 hours, and at Lund for 17½ hours at the summer solstice. Refraction increases the average length of the day by 30 min. in the north and by 15 min. in the south. More important is the effect of twilight, which results in daylight lasting without interruption from June 16 to 27 as far south as Hernösand (62° 38′ N.).

The average annual rainfall for Sweden increases, on the whole, from north to south, reaching a maximum towards the south-west. Thus the average in the north of Norrland is 16·5 in., and in the south is 22·5 inches. At Borås, midway between the south end of Lake Vetter and the Kattegat, the average is 35 inches. The minimum at Karesuando is 12·3 inches. The period of maximum is generally the latter half of the summer, and the minimum in February and March. The proportion of total precipitation which falls as snow ranges from 36% in Lappland to 9% in Skåne. Snow lies 47 days on an average on the plains of Skåne, while in the north it lies from 140 to 190 days. The Swedish glaciers cover some 135 sq. miles. They occur in the northern highlands about Kebnekaise, Sarjektjåkko and Sulitälma. The most southerly is on the slopes of Helagsfjäll in Lat. 62° 54′ N.

Flora.—The extensive range of latitude and altitude produces many local vegetation differences. Four main regions can be distinguished tending to grade into one another near their adjacent fringes. In descending order of altitude, and largely of latitude also, are: (1) alpine regions, (2) zone of birch woods, (3) coniferous forest region, (4) the beech wood patches. The alpine region occupies only the upper flanks of the spinal mountain-range, at an altitude above 1,600 ft. in the north and above 3.000 ft. in the south. It is treeless, though shrub-like willows and birch exist together with numerous berry-bearing plants. These are intermingled with extensive tracts of heather. In the bleaker wind-swept spots reindeer "moss" occurs with an occasional arctic poppy or a saxifrage. The birch forests are much more extensive in the north and form patches of woodland 10 to 20 m. wide; southwards the strip narrows to individual trees Rowans, aspens and wild cherries occur and there is considerable undergrowth. At the higher elevations the birch becomes stunted and the lighter woodland is marked by considerable growths of wild strawberry and raspberry. The coniferous forests are the most extensive and cover nearly all of the country north-east of Lake Vener. The important tree on the drier and higher ground is the Scots pine (*Pinus sylvestris*) but enormous numbers of spruce (*Abies excelsa*) are also found. The conifers extend from sea-level to 2,500 or 3,000 ft. and though the pine and spruce predominate yet there is a sprinkling of lowland birches, rowans and aspens, in the north, while large numbers of such deciduous trees as oaks, ash, lime, maple and elm are found in the south. These latter trees seldom extend beyond 1,600 ft. altitude and the oak ceases about 61° N. (inland) and 63° N. (coastal). The undergrowth is usually slight but in the thinner-soil areas the bilberry (spruce) and whortleberry (pine) flourish. Much of the coniferous forest has been depleted by forest fires and lumbering, particularly along the lower courses of the larger streams. The beech forests with occasional oak are restricted to Skåne, southern Öland and the shores of the Kattegat. They are tending to be reduced by extended land cultivation. The flowering plants are largely immigrants since the last glacial epoch and the number of species shows a decrease northwards.

Fauna.—The effects of the great latitudinal range of Sweden are also shown in the case of fauna. Only a few animals such as the hare, ermine and the weasel are common to the entire country, but the squirrel, fox and various shrews have a wide range over the lower lands. Formerly bounties were paid for the extermination of the larger animals which have been greatly reduced in number. The bear is now protected. This and the wolf, the glutton or wolverine, and the lynx are becoming restricted to the more solitary depths of the northern forests. The wild reindeer, now protected, is rare, though large domesticated herds form practically the sole source of livelihood to the Lapps. The elk, also carefully preserved, haunts lonely forests over a considerable range; the roe-deer is confined to the south. In the midland plains the common fox is still abundant and the badger exists in large numbers. The latter and the otter, together with the pine-marten of the coniferous forests, are hunted for their skins. The common porpoise, is the only whale occurring in the Baltic; it, and the common grey seal are held to be responsible for much damage to fisheries. Bird life is very abundant in summer; several types such as the teal, snipe, golden plover and wagtail are common to the whole country. The arctic fox and the lemming are mountain animals; the former is normally confined to the highlands

of the north, but it also joins in the chase when the lemmings make their non-periodical migrations to the lowlands during which their vast moving hordes are the prey of bird, wild and domesticated animals and man alike.

In the northern mountains the ptarmigan is common; ducks and other water-fowl frequent the lakes both here and in the south; the golden eagle, certain buzzards, owls and the small Lappland bunting are found. In the coniferous forests, grouse, capercailzie and woodcock are the principal game birds; the crane lives in marshy clearings, birds of prey are numerous and jays range over a wide area. In the midlands the partridge is fairly common and doves occur. On the coast large numbers of gulls and terns are found, also the eider-duck and the sea-eagle. There are very few reptiles or amphibians and the viper is the only poisonous species of snake. The rivers and lakes are generally well stocked with fish, such as salmon, trout, char, pike and perch, and fisheries, both fresh-water and sea, are of some consequence, though Baltic waters are less favourable to marine species than the open waters off Norway. Cod, flatfish, mackerel and sprat are caught, but great numbers of a small herring called *strömming* form the most important fishing product of the Baltic. In the brackish waters of the east coast salt-water and fresh-water forms are found The crayfish is common in many places in central and southern Sweden and when tinned forms a valuable export. Pearls are at times found in a fresh-water mussel and oysters are dredged along the western Baltic coast. Among the lower marine animals a few types of arctic origin are found, not only in the Baltic but even in Lakes Vener and Vetter, having survived the changes consequent on the separation of the Baltic sea and Arctic ocean Insect fauna is rich, even in the north, where very rare and brilliant butterflies are found. In summer in the northern lowlands the mosquito is sufficiently common to cause annoyance to the reindeer which it drives to the upper pastures

POPULATION

People.—The population of Sweden at the 1920 census was 5,904,489 (est. Dec. 1926—6,074,368). Public registration is in the hands of the clergy and, particularly in large parishes, encroaches largely upon their time, but it results in much of that close contact between Church and people which is such a marked feature of Swedish life A general census is taken every 10 years and approximate returns are made annually.

The table in the next column shows the distribution of estimated population in 1926 in the several governments (*Län*). The older "province" divisions differ from the *län,* but their names remain in common use.

Old provinces	Län	Area sq m.	Pop. 1926
Norrland—			
Lappland, Norrbotten	Norrbotten	40,742	192,441
Lappland, Vesterbotten	Västerbotten	22,755	198,044
Ångermanland, Medelpad	Västernorrland	9,858	274,373

	Malmöhus	1,871	503,997
Gottland	Gottland*	1,220	56,057
Öland†	.	.	..
Total	.	173,154‡	6,074,368

*The island and adjacent islets.
†Island included in Kalmar Län
‡Including the four great lakes, Vener, Vetter, Mälar, Hjelmar, 3,510 sq miles.

The previous approximate totals were: 1750, 1,780,000; 1800, 2,347,000; 1850, 3,482,000; 1900, 5,136,000. The average annual increase was 7·86 per 1,000 in the 19th century, reaching a maximum of 10·39 in 1841–60; in 1920 it had fallen to 6 9. Emigration, especially to the U S A, increased rapidly from 1860 onwards with a maximum during the period 1881–90 (average 37,640 per annum) From 1921 to 1926 the total has oscillated about 11,000 per annum, but reached nearly 30,000 in 1923. The immigrants are usually considerably fewer, but they exceeded the emigrants during the World War and in 1920. Men predominate among the emigrants and partly explain the unequal number of the sexes resident in Sweden. In 1920 there were 3,006,233 females and 2,898,256 males. The Swedish people belong to the Scandinavian race, but the population included (1920) about 30,000 Finns and 7,200 Lapps, living in the north. The population is as a whole homogeneous.

Population is denser in the south than in the north; in 1926 Malmöhus Län had about 269 persons per sq.m, but in Norrland there are less than 11 persons per sq m However, the increase in Norrland has been important. The annual excess of births over deaths in 1926 was 31,053 or 5·12 per thousand. The death rate was only 11·75 per 1,000 in 1926. The lowest mortality is found in the southern districts; the highest in the northern and the east midland districts. The percentage of illegitimacy (14·9% of total births in 1926) is tending to decrease; the percentage of married persons is low. Previously, social evils were associated with intemperance. In 1775 Gustavus III. made the manufacture of spirits (*brännvin*) a Government monopoly, and the drinking habit was actually fostered. By 1830 some nine gallons of spirits were consumed annually per head Mainly through the efforts of Peter Wieselgren, dean of Gothenburg (1800–77), a strong temperance reform movement set in, and in 1855 restrictive liquor laws were passed. Municipal control of intoxicants was devised in Falun (1850) and applied to Gothenburg (1865). By 1910, prohibition had become popular but in 1922 a plebiscite was against it Dr. Ivan Bratt's system eliminates many evils of alcohol and has led to legislative control of the trade.

BY COURTESY OF SWEDISH STATE RAILWAYS
DALECARLIA PEASANTS IN WINTER COSTUME

The Swedes probably possess the purest Teutonic blood in existence; they are nominally light-hearted and vivacious. In the more remote parts of the country old customs are maintained and picturesque local costumes still worn, as in Dalecarlia (*q v*). Although the characteristic celebrations at weddings or periodical festivals are somewhat decreasing in favour, there are certain occasions such as Christmas Day and Midsummer, which are observed as holidays with much ceremony. Food in the midlands and south is plentiful and good; in the remoter parts of the north an unfavourable summer may mean a winter of scarcity or even famine; and in these parts meat is little used. Rye was extensively employed in the rural districts for the making of a hard bread in flat cakes (*knäckebröd*); it is now increasingly giving place to wheat. A formerly prevalent, but now decaying, custom among the better classes is that of beginning meals with a selection of such viands as anchovies, smoked salmon or slices of meat, of which a large variety of small quantities are provided (*smörgås-*

bord). These are taken with bread and butter and a glass of spirits. Swedish national games have been revived considerably during the 20th century. These include ski-running (*skid-löpning*), skating and skate-sailing, tobogganing, sledging and sailing. The Royal Swedish Yacht Club (Stockholm) is the largest in the world. Among games, lawn-tennis and football, together with the game of *pärk*, peculiar to Gottland, are played.

Towns.—Up to 1860 the percentage of urban population remained nearly stationary at about 11. Its subsequent figures have been 1880, 15·12; 1900, 21·49; 1926, 31. The towns with a population exceeding 25,000 in 1927 are Stockholm (453,332), Göteborg (231,213), Malmö (116,827), Norrköping (60,400), Hälsingborg (52,470), Gävle (39,418), Örebro (36,463), Borås (33,544), Eskilstuna (30,655), Uppsala (30,156), Jönköping (29,996), Linköping (29,165), Västerås (29,059), Karlskrona (27,188). Stockholm shows the greatest increase during the 20th century—over 150,000.

CONSTITUTION

Constitution and Government.—Sweden is a limited monarchy, the Constitution resting primarily on a law (*Regeringsformen*) of June 6, 1809. The executive and judicial authority is vested in the king alone but his resolutions must be taken in the presence of the Council of State (*statsrådet*). The councillors, appointed by the king, are responsible to the parliament (*Riksdag*). At present they are 12 in number, one being prime minister (*statsministern*) two others consultative ministers, without portfolio, and the remaining nine are heads of the departments of administration, which are justice, foreign affairs, defence, social affairs, communications, finance, public worship and education, agriculture, commerce. Administrative posts are in principle equally open to men and women. Holders of Government offices are appointed by the king on the advice of the Council of State. Apart from a very few exceptions, none may be dismissed except in case of default and after trial and judgment. The king shares legislative powers with the Riksdag, possessing the rights of initiation and absolute veto. He has also, in certain administrative and economic matters, *e.g.*, the police system, a special legislative right. The general tendency in the constitutional system of Sweden, however, since 1809 has been to restrict the influence of the Crown in favour of the Riksdag.

The Riksdag consists of two elected chambers. The members of the upper chamber are elected by the *landsthing* (representatives of the *län*) and by the municipal councils of the larger towns. They number 150, and are distributed among the 19 constituencies in proportion to population; the distribution being revised periodically. Eligibility necessitates Swedish birth, an age of at least 35 years, and the possession, at the time of election and for three years previously, either of real property to the value of 50,000 kronor (£2,777), or an annual income of 3,000 kronor (£166) on which taxes have been paid. Members are elected for eight years. The members of the second chamber number 230, chosen in 28 election areas and elected for four years. The members of both chambers receive travelling expenses to and from the Riksdag, together with a salary for 140 days. The salary 24 kronor or 32 kronor a day is dependent on the place of home residence. The franchise was for long extremely limited, but it is now universal for men and women over 23 years of age. The agreement of both chambers is necessary before a bill is sent forward for royal assent, but when they differ on taxation questions—for which the Riksdag alone has the power of decision—the matter is settled by joint voting, which arrangement gives the second chamber a certain advantage from the greater number of its members. A feature of the Riksdag is the numerous standing committees, controlling the army, navy and other departments.

Local Government.—Sweden is divided into 25 administrative districts or *län* (*see* population statistics). The elected representative body in each is the *landsthing*, which deliberates on the more local affairs of the *län*. The chief official of the *län* is the governor (*landshöfding*) under whom are secretarial, police and fiscal departments. Seven privileged towns, receiving their privileges from the Government (not necessarily on the basis of present population), are under a mayor (*borgmästare*) normally a professional lawyer, and aldermen (*rådmän*). The aldermen are elected by the citizens, while the mayor is appointed by the Government from the first three aldermen on the poll, is paid and holds office for life. The city of Stockholm (*q.v.*), a *län* in itself, has a special form of government. The major rural divisions are the 119 *fögderier*, under bailiffs, a subdivision of which is the *länsmansdistrikt* (489 in all), under a constable.

Justice.—Justice is administered by tribunals of three instances (1) District and borough courts. There are 125 rural judicial circuits (*domsagor*), which may be subdivided into judicial divisions (*tingslag*). Each *tingslag* has a district court (*häradsrätt*), consisting of a judge and 12 unpaid assessors (*nämndemän*), elected by the people for a period of six years. If all jurors present are unanimously of a different opinion from the judge, they can outvote him. The town-courts in the privileged towns are called *rädhusrätt*, and consist of the mayor and at least two aldermen; they are without jurors and therein differ from the district courts. (2) There are three courts of appeal (*hofrätter*), in Stockholm, Jönköping and Malmö. (3) The Supreme Court (*Högsta Domstolen*) passes sentences in the name of the king, who is nominally the highest judicial authority. The court, which meets at Stockholm, has a membership of 24 justices (*justitieråd*). The Law Council (*Lagrådet*) which consists of three high court judges and one member of the Supreme administrative Court (*Regeringsrätten*) examines all legislative bills before they are laid before the Riksdag.

Religion and Education.—The non-Protestants number but about 11,000, 6,500 Jews, 3,500 Roman Catholics, and more than 99% of the total population belong to the Swedish Lutheran Church, of which the king, who must profess the pure evangelic creed, is the supreme administrator. Sweden is divided into 12 dioceses (with Uppsala, since 1164, as the Metropolitan see) and 188 rural deaneries. The parishes number 2,588, united into 1,419 rector's districts. All citizens contribute to the Swedish Church, in consideration of the secular duties of the priests. Contributions may be reduced for those who support another Church which is legally recognized. Since 1842 public elementary education has been free and compulsory, and, in the case of children not attending the state schools, the parents must show proof that they are being privately educated. There were (1928) 77 public secondary schools, 53 people's high schools, various technical and special schools. Sweden has two old universities, at Uppsala (founded 1477) and Lund (founded 1668); there are State faculties in certain branches of learning at Stockholm and Göteborg.

Bibliography.—The Government of Sweden has a statistical department which publishes a number of annual volumes. For an extensive list of these and also of non-official publications relating to Sweden *see* the *Statesman's Year Book*, issued annually (London). An annual statistical summary is also issued, *Statistisk Årsbok for Sverige*. The Swedish Government also published, in 1914, *Sweden:* Historical and Statistical Handbook by J. Guinchard. (There are Swedish, English and German editions.) The two large volumes give a comprehensive account of geographical, historical and economic aspects of the country, and largely replace *Sweden; its People and its Industry* (edit. G. Sundbärg) which the Swedish Government had issued previously (English ed., Stockholm, 1904). *The Sweden Year Book* (annual) edited and published with the assistance of public authorities, includes a very extensive bibliographical section. An important British publication is *A Handbook of Norway and Sweden*, compiled by the Geographical Section of the Naval Intelligence Division, Naval Staff, Admiralty (1920). *See* also Sten De Geer, *Befolkingens Fördelning i Sverige* with maps on a scale 1/500,000 (Stockholm, 1919); maps and year books, *Svenska Turistföreningen*. (W. E. Wh.)

DEFENCE

Since Sweden, a province of Denmark from 1397 to 1521, became an independent kingdom, its military history has been marked by the accession to the throne in 1523 of the national hero Gustavus Vasa; by the accession to the throne in 1611 of Gustavus Adolphus (*q.v.*), the great leader who headed the Protestant cause in Germany and was killed at Lützen (*q.v.*) (Nov. 1632); by victory on the part of the Swedes over a Russian army at Narva (Nov. 1700) and defeat at the same hands at Pultowa

(July 1709), both in the reign of Charles XII., who after prolonged conflict was killed at the siege of Frederikshald (Dec. 1718); by the seizure of Swedish Pomerania by Napoleon in 1812, followed, in 1813, by the accession of the Swedes to the grand alliance against him; and by the cession of Norway to Sweden under the treaty of Kiel (Jan. 1814), an arrangement that endured until October 1905. Sweden did not rally to the cause of Denmark when attacked in 1864, and remained neutral in the Franco-Prussian war of 1870 and in the World War Agitation by Norway for independence in 1892 led to the passage of acts for the reorganization of the army.

Present-day Army Recruitment and Service.—Liability for every male Swedish subject to perform military service begins in his 21st and ends with the commencement of his 43rd year. The yearly contingent up to 1935 is estimated at 37,700, of whom 31,360 are allotted to the army, 7,000 of them going direct to the reserve. Training of recruits lasts from 140 to 260 days Special training for officers takes 2½ years

Strength and Organization—The strength, including recruits, varies with the period of the year. The average can be taken at about 31,000, including 2,800 officers and about 2,000 non-commissioned officers who form a class apart from "other ranks."

There is a special committee of military training under an inspector, and the following establishments· (a) Royal military academy, Stockholm, (b) Royal ordnance and engineer academy, Stockholm; (c) Royal military college, Karlberg, (d) Riding school, Stromsholm; (e) Musketry school, Rosersberg; (f) Non-commissioned officers' school, Stockholm

The Swedish air force consists of 4 groups of aeroplanes and 318 recruits are trained annually, including volunteers

See also League of Nations *Armaments Year-Book* (Geneva, 1928). (G G A)

Navy.—Sweden has to face the numerically formidable, if inefficient, fleet of Soviet Russia across the Baltic.

Sweden possesses eleven coast defence battleships, three being comparatively modern These latter are the "Sverige," (7,600 tons), and the "Drottning-Victoria" and "Gustaf V" each of 7,900 tons These carry four 11″ and eight 6″ guns. Other ships are· 1 old armoured cruiser, 10 destroyers, 27 torpedo boats, 17 submarines, 3 miscellaneous craft

A new type of coast defence ship is projected and two new destroyers and two new submarines are building The personnel consists of about 5,500 officers and men, recruiting being conscriptive

See *Brassey's Naval and Shipping Annual;* F T Jane, *Fighting Ships.* (E. A.)

ECONOMIC CONDITIONS AND TRADE AND COMMERCE

Not quite one-third of the population live in the towns About 44% now earn their living by agriculture compared with 70% fifty years ago. Within the same period the industrial population has increased from 15% to 35% and the population living by trade and communications from 5% to 15%

The cultivated soil is only 9·3% of the whole; about 2% consists of natural meadowland. About 60% is covered by forests, principally pine-forests; the rest is mountain and barren land The cultivation of corn—especially of wheat—is practised most in the southern provinces, while cattle-raising is easily predominant in the north. What used to be fallow-land is used for fodder roots. In Skåne sugar-beet is grown. The wheat produced per acre is exceeded only by Denmark, the Netherlands, Belgium and Great Britain About 200,000 tons of wheat are imported annually But although Sweden is not self-sufficing in grain, there are considerable surpluses of butter and bacon (in 1927, 18,500 and 26,700 tons respectively), which are exported, chiefly to England. But oil-cakes and other "strong food" are imported. Small farms of less than 20 acres take up about 33% of the whole cultivated area; those of medium size of from 20 to 100 acres about 45%; the farms of over 100 acres take up the rest. Of all the land in private ownership, about one-fourth is held on lease.

Forestry.—The forest-industry is chiefly in Norrland, *i e.,* in the region north of the 60th degree of latitude. The winter snows facilitate the transport of the felled tree-trunks, and over the waterways they can be transported inexpensively to the saw-mills and factories on the coast. The length of floating ways is nearly 20,000 English miles. The annual consumption of timber from the Swedish forests is estimated at 45 million cubic metres (nearly 1,600 million cubic feet). Of this nearly half is exported as deals, battens, box-boards, and pulp. Charcoal is still used for iron production. Pit-props are exported to England. The forests are beginning to be exhausted and there is systematic afforestation. A balance is now preserved between the growth of the forests and the cutting down. The exportation from the saw-mills amounts annually to from 4 to 5 million cubic metres (about 1,000,000 standards). The greatest consumer is Great Britain.

Wood Pulp.—The manufacture of pulp, mechanical as well as chemical (sulphite as well as sulphate) has long been in progress on an increasing scale. It now (1928) reaches nearly 2 million tons (dry weight) annually. The exportation of it for 1927 was about 1,450,000 tons (dry weight) of which 80% was chemical and 20% mechanical. Of all the mechanical pulp produced by the world about one-fourth comes from Sweden, and of the chemical about one-half. Pulp is exported and used for making paper

Out of a production of about 500,000 tons in 1927 there were exported over 400,000 tons of paper. The principal customers are Great Britain and the United States. The export of the wood products in 1927 represented a value of £40,000,000, equal to 45% of the country's entire exports.

Fuel and Power.—Only in the north have coal deposits been found, in which about 400,000 tons of coal are hewn annually with fireproof clay. The import of coal is high; in 1927, the figure was 5,900,000 tons, chiefly from England. As fuel, wood and peat are used. The waterfalls could produce up to 4,500,000 horse-power. Of this about 1,400,000 is taken into use A number of power-works distribute electric energy. The largest power-works, those at Trollhättan on the Gotaalv, Älvkarleby on the Dalalv and Porjus on the Lulealv in Lapland, belong to the State.

Minerals.—Sweden's iron deposits are amongst the richest in the world. They consist of the mines in central Sweden, *Bergslagen,* long worked, and of the later mines in northern Lappland, Kirunavaara, Luossavaara, etc. The former, which contain a singularly pure iron, are used principally by Sweden herself. The Lappland mines, the iron of which is phosphorus-bearing but very rich (60 to 70% iron), are worked for export. Of Europe's total resources in high percentage iron-ore more than 90% is to be found in these Lappland mines Proprietorial rights belong to the Swedish State and to the Grangesberg company in common, but the industry is in the hands of the company only The export of iron ore, chiefly to Germany, amounted in 1927 to 10,700,000 tons

In the 18th century Sweden took first place among iron-producing countries. The use of coal changed this pre-eminence As regards quality, however, Swedish output is unsurpassed After the World War, production went down greatly Pig-iron manufacture amounted in 1927 to only 413,000 tons, steel manufacture to only 517,000, compared with 730,000 and 750,000 respectively in 1913. The exportation of iron has decreased from 480,000 tons in 1913 to 263,000 in 1927.

Machinery.—The making of machinery has been developed, for instance, separators, motors, electrical machines and apparatuses, agricultural machines, ball bearings, etc. Minor iron articles, also, such as cutlery, enamelled vessels and other household things made of iron, are being exported on a large scale. The shipbuilding industry also has gone ahead strongly of recent years. The export of iron products amounted to about £15,000,000 in 1927

Other Industries.—There is a preparation of granite for road-making and building purposes, and the cement industry Beet-sugar also is refined. The match industry has been merged into one single Trust (*Svenska Tändsticksaktiebolaget*). This organisation now covers the whole world and, with the help of English and American capital, controls the production of matches in most countries.

Actual industries, apart from hand-work and building operations, employ about 400,000 workers (in 1900, the number was 296,000).

The value of the foreign trade per inhabitant is about half that in Great Britain. Imports amounted in 1927 to £86,700,000, exports to £88,700,000. Ordinarily the excess is on the side of imports. Of exports in 1927, pulp and paper represented 26%, wood products 18%, metal-work and machinery 17% and iron ore 9% of the value of the total exports. The greatest consumer of Swedish products is Great Britain (28%); next come Germany (17%) and the United States (11%). From these same countries Sweden obtains the bulk of its imports but here Germany occupies the first place.

Before the World War as a general rule much capital came into Sweden from abroad, the country's own command of capital being inadequate for the great activity manifested in the building of railways, the construction of industrial plants, etc. But the war turned Sweden into a great exporter of capital. At the moment, the imports and exports of capital seem to maintain a balance. Sweden's policy is moderately protective. There has been little increase of tariff since the war.

Shipping.—About half Sweden's imports and exports are transported on Swedish tonnage, about half on foreign tonnage. Her commercial navy has grown greatly since the beginning of this century. It amounts now to nearly 1,500,000 tons register gross, of which 93% is represented by steamers and motor-vessels.

Internal Communication.—Sweden possesses a highly developed network of railways, the beginning of which dates from the 1850's. The total length of the lines amounts to about 10,000 English miles. In proportion to the population this is the highest figure reached by any European country. About 3,700 miles belong to the State. Their total freight revenue exceeds that of all the other railways. By means of ferry-steamers the Swedish State lines are in direct communication both with Germany (Trälleborg-Tassnitz) and with Denmark (Malmö-Copenhagen and Hälsingborg-Hälsingör).

The number of telephones in Sweden amount to 440,000, *i.e.*, 1 to 14 inhabitants; the corresponding figures in Great Britain are 1 to 40. Swedish firms have been employed in setting up and managing central telephone establishments in other countries.

Finance.—Sweden's financial system since the year 1873 has been on a gold basis, the counting-unit being one krona, which is divided into 100 öre. £1 equals 18·16 kronor. There is no actual circulation of gold but the ordinary method of payment is in notes issued by the Riksbank. During the war, in Sweden as in other European countries, the redemption of notes was suspended. Their value sank to a certain degree in relation to gold, in the year 1920 down to 40%. There was then a rapid movement up again, followed by a heavy fall in prices, and on April 1, 1924, the redemption of gold was brought back definitively to par. Sweden was the first country in Europe thus to restore her gold currency after the war to its pre-war basis.

The Riksbank, which is the central bank of the country (and the oldest in Europe, with a history going back to 1668), is a State bank, pure and simple, and since 1904 has had a monopoly in the issuing of notes. Of its board of directors, one member, who is also chairman, is appointed by the king, and six members are appointed by the *riksdag*. Commercial banks began to come into existence in the 1830's, at first in the form of companies with joint responsibility. Bankers of this type had the right to issue notes down to 1904. Some of them are still in existence; the most prominent of them is Stockholms Enskilda Bank. Most of the commercial banks of more recent origin, however, have taken the form of joint stock companies. A strong concentration movement has of late been in progress in the banking world, whereby the total number of banks has been reduced from 80 in 1910 to 31 in 1928. Four large banks have come into existence, namely, AB Svenska Handelsbanken, Skandinaviska Kredit AB, AB Göteborgs Bank, and Stockholms Enskilda Bank, which handle about two-thirds of the commercial business. Their capital and funds amounted in 1927 to about £26,400,000 and their turnover to about £174,000,000. The Swedish commercial banks do not as a rule (like the German banks) found new businesses.

There are nearly 500 savings banks, apart from the State's post office bank. The deposits handled by these are about £160,000,000.

Revenue.—The State's revenue and expenses for the Budget year of 1927–28 balanced on a sum of about £39,000,000. Of this about £37,000,000 was made up of taxes and other real State revenue, the rest of loans. Of the former something over £11,000,000 comes from taxes on income and property, about £18,000,000 from customs and excise, the rest mostly from profits on State enterprises and from productive funds. The State's debts amount to about £100,000,000. Formerly the funded State's debts were placed abroad but the repurchase of Government bonds has taken place on a large scale, and State loans have been taken up at home. Of all the State debentures about 80% may be in Swedish hands. The yearly interest paid on the State debt, £4,700,000, is covered by productive activities bringing in about £5,700,000. During 1913–14 the State's taxation revenue amounted to 62%, that of the local authorities to 38% of the total taxation. According to the latest figures the proportions were 55 to 45. The burden of debt which rests on the local authorities amounts to about £70,000,000. (K. A.)

HISTORY

The first historical notice relating to Sweden is found in Tacitus, *Germania*, cap. 44, in which we find the name of the chief people of the peninsula, the Swedes proper, Suiones (O.N. *Sviar*, Swed. *Svear*, A.S. *Sweon*), who eventually gave their name to the whole country. According to Tacitus they were governed by a king whose power was absolute, and possessed a strong fleet which secured them from hostile incursions. Their original territories lay on both sides of the Mälar, in the provinces later known as Upland. Södermanland and Westmanland. Other early Roman writers, Mela and Pliny, mention the country under the name Skåne. (*See* SCANDINAVIAN CIVILIZATION.)

The people next in importance to the Suiones in the peninsula (Swed. *Götar*, O.N. *Gautar*, A.S. *Geatas*) are first mentioned by Ptolemy (under the form Goutai for Gautoi). He puts them in the southern part of the country. Götaland consisted of Vestergötland and Östergötland divided from one another by Lake Vetter, together with Småland. In early times Vestergötland seems to have been the most important; Vermland, the district to the north of Lake Vener and the whole of the country to the north of Svealand seem to have been of small importance. Jämtland was always considered a part of Norway. After the time of Ptolemy we hear no more of Sweden until the 6th century, when a surprisingly full account of its peoples is given by the Gothic historian Jordanes. He speaks of trade in furs of arctic animals which were sold by merchant to merchant until they reached Rome.

For the same period information is to be found in the Anglo-Saxon poem *Beowulf*. The hero himself belonged to the Geatas (*i.e.*, in all probability Götar), his mother being the daughter of their king Hrethel. Haethcyn, Hrethel's son, is said to have perished in a disastrous battle against the Svear, but his fall was avenged by his brother Hygelac in a subsequent engagement in which the Swedish king Ongentheow was killed. This Hygelac is clearly identical with that Chochilaicus wrongly described as a Danish king by Gregory of Tours (iii. 3) who died in battle with the Franks under Theodberht about A.D. 520. We learn further that about the time of Hygelac's death strife broke out in the royal family of the Svear, between Onela, the son and successor of Ongentheow, and Eanmund and Eadgils, the sons of his brother Ohthere. The latter fled for protection to the Götar and the war which ensued cost the lives of Eanmund and of Heardred the son and successor of Hygelac. According to the poem, Beowulf himself became king of the Götar, but Beowulf's later history has a mythical character, and for three centuries after this time we have no reference to Swedish affairs in English or other foreign authorities. The kingdom of the Götar probably ended soon after the 6th century.

At a later time the kings of Norway claimed descent from the ancient royal house of the Svear, and their traditions, though in great part mythical prove at least its high antiquity. They trace back its origin to the god Frey, son of Niörðr, who is said to have founded Uppsala, the ancient capital of Sweden. Among his descen-

dents Athils, the Eadgils of *Beowulf*, is a prominent figure and, in general, the account given of him agrees with *Beowulf*.

Early Kings.—Four generations after his time a king named Ingialdr was overthrown by a prince from Skåne, called Ivarr Viðfaðmi His son Olafr Trételgia withdrew to Vermland, which he brought into a state of cultivation, though he was subsequently sacrificed by his subjects in a time of famine. The sons of Olafr Trételgia moved westward into Norway, and if we may trust later traditions Sweden passed out of their family. The subsequent kings of Sweden are said to have been descended from Ivarr Viðfaðmi. About 830 the missionary bishop Ansgar made his way to Birca on the Malar For more than a century after Ansgar's death no serious mission seems to have been attempted.

During the 9th century extensive Scandinavian settlements were made on the east side of the Baltic The famous expeditions of Rurik and Askold which resulted in the origin of the Russian monarchy appear to have taken place towards the middle of the century, but it is not possible to connect these names with any families known to us from Swedish tradition Many names in Russian chronicles seem to be Swedish

The continuous history of Sweden begins in the early 10th century, when a king named Eric son of Emund was reigning at Uppsala. Before the end of the century his descendent Olaf Skóttkonung had created what for the moment was the strongest kingdom in the North. Under him Christianity was established in Sweden. As a leading ally in a coalition which included Sweyn king of Denmark and earl Eric of Lade he overthrew Olaf Tryggvason, king of Norway, and annexed for a time part of Trondhjem and the district now called Bohüslan which he handed over to earl Sweyn, brother of earl Eric as a marriage portion for his daughter Holmfrið Some years later another Norwegian prince, Olaf Haraldsson (the Fat), returning to Norway as king, put an end to the Swedish and Danish supremacy, and in 1015 forced earl Sweyn to leave the country. An attempt to arrange a marriage alliance between Olaf Skottkonung and the new king of Norway was unsuccessful, and the relations between these kings were still strained when the former died probably in the winter of 1021–2.

Anund, his son, early in his reign allied himself with Olaf Haraldsson against Canute of Denmark, who had demanded the restitution of the rights possessed by his father Sweyn in Norway. The allies took advantage of the Danish king's absence to harry his land. On his return an indecisive battle was fought at Helgi Á, and Anund returned to Sweden. Olaf was driven from Norway by the Danes, but in 1030 he raised a small army in Sweden only to meet his death at the battle of Stiklestad Adund, who died about 1050, according to Adam of Bremen, was succeeded by his brother Emund the Old, who had been previously passed over because his mother was unfree, the daughter of a Slav prince and captured in war. This king had become a Christian, but soon quarrelled with Adalhard, archbishop of Bremen, and endeavoured to secure the independence of the Swedish church, which was not obtained for another century. Under Emund there was a rectification of boundaries which assigned Blekinge to Denmark.

With his death in 1060, the old family of Swedish kings dies out. He was succeeded by his son-in-law Steinkel, a noble of Vestergötland, who was warmly attached to the Christian religion, though he refused to destroy the old sanctuary of idols at Uppsala. During his reign grants of land in Vermland made by the king to the Norse earl Haakon Ivarsson led to a successful invasion of Götaland by Harold Hardrada of Norway. Steinkel also had disputes with Denmark. His death in 1066 was followed by a civil war, and for the next fifteen years the history of Sweden is very obscure. In 1081 we find the sons of Steinkel, Inge and Halstan reigning. Inge's attachment to Christianity caused him to be expelled after a short time by his brother-in-law Sweyn or Blotsweyn, so called from his revival of the old sacrifices, described by Adam of Bremen. Sweyn retained the kingship only for three years before Inge returned and slew him.

Stefansson, *Hist. of Denmark and Sweden* in *Story of the Nations* Series (1916); *Sveriges historia*, vol i (Montelius and Hildebrand, Stockholm, vol. 1. 1919, vol. 2. 1925).

Organization of the Kingdom.—Under Blotsweyn's grandson, King Sverker (1134–1155), who permanently amalgamated the Swedes and Goths (each of the two nations supplying the common king alternately for the next hundred years), Sweden began to feel the advantage of a centralized monarchical government Eric IX. (1150–1160) organized the Swedish Church on the model prevalent elsewhere, and undertook a crusade against the heathen Finlanders, which marks the beginning of Sweden's overseas dominion. Under Charles VII, the archbishopric of Uppsala was founded (1164) But the greatest mediaeval statesman of Sweden was Earl Birger, who practically ruled the land from 1248 to 1266. To him is attributed the foundation of Stockholm, but he is best known as a legislator, and his wise reforms prepared the way for the abolition of serfdom. The increased dignity which the royal power owed to Earl Birger was still further extended by King Magnus Ladulås (1275–1290). Both these rulers adopted the dangerous expedient of creating a number of almost independent duchies in Sweden, but the danger of weakening the realm by partition was averted, though not without violent complications. In 1319, the severed portions of Sweden were once more reunited. Meanwhile the political development of the state was steadily proceeding. The formation of separate orders, or estates, was pronounced by Magnus Ladulås, who extended the privileges of the clergy and founded an hereditary nobility (Ordinance of Alsnö, 1280). In connection with this institution we now hear of a heavily armed cavalry as the kernel of the national army The knights too became distinguishable from the higher nobility To this period belongs the rise of a prominent burgess class, as the towns now began to acquire charters. At the end of the 13th century, and the beginning of the 14th provincial codes of laws appear and the king and his council execute legislative functions

Union of Kalmar 1397.—The first union between Sweden and Norway occurred in 1319, when the three-year-old Magnus, son of the Swedish royal duke Eric and of the Norwegian princess Ingeborg, who had inherited the throne of Norway from his grandfather Haakon V., was in the same year elected king of Sweden (Convention of Oslo). A long minority weakened the royal influence in both countries, and Magnus lost both his kingdoms before his death. The Swedes, irritated by his misrule, superseded him by his nephew, Albert of Mecklenburg (1365). In Sweden, Magnus's partialities and necessities led directly to the rise of a powerful landed aristocracy, and, indirectly, to the growth of popular liberties Forced by the unruliness of the magnates to lean upon the middle classes, the king summoned (1359) the first Swedish *Riksdag*, on which occasion representatives from the towns were invited to appear along with the nobles and clergy. His successor, Albert, was forced to go a step farther and, in 1371, to take the first coronation oath. In 1388, at the request of the Swedes themselves, Albert was driven out by Margaret, regent of Denmark and Norway; and, at a convention of the representatives of the three Scandinavian kingdoms held at Kalmar (1397), Margaret's great-nephew, Eric of Pomerania, was elected the common king, but the liberties of each of the three realms were expressly reserved and confirmed. The union was to be a personal, not a political union. (X.)

THE 15TH AND 16TH CENTURIES

Danish Plans for Union.—The Swedish nobles who were dissatisfied with the evil rule of Albrekt of Mecklenburg called in Margaret, Valdemar Atterdag's powerful daughter and successor on the Danish throne, and she became queen of Sweden also in

1389. Norway was already united with Denmark and Margaret's plan was to bring all the three kingdoms together into a single union under Denmark. An Act of Union was drawn up at Kalmar in 1397 but was not proceeded with as the Queen was dissatisfied with some of its clauses. At the same time her relative, Eric of Pomerania, was elected future king of the three kingdoms. After Margaret's death in 1412 he assumed the Government and proceeded to try to change Sweden into a vassal country with the help of a system of Danish bailiffs. The consequent oppression became so hard that the Swedish peasants rose in 1434 under the leadership of Engelbrekt Engelbrektsson, a noble from Bergslagen. The national movement spread swiftly and the Danish strongholds were conquered. In the course of this fight for freedom Engelbrekt called together at Arboga, in Jan. 1435, the first *Riksdag* of nobles, priests, burghers and peasants. The *Riksdag* has never been done away with since, so that in 1935 Sweden's parliament will commemorate its 5th centenary. In 1436 Engelbrekt was murdered. For several decades a Party in favour of the Union, made up of the more important nobles and the clericals, with Danish support, proceeded to contend against a National Democratic Party under native leaders taken from the nobles. Danish kings were on several occasions recognized as rightful sovereigns also of Sweden, among them, for instance, Christopher of Bavaria (1440–48) in whose reign there was enacted in 1442 a new general law which, with additions, held good until 1734, and Christian I. (1457–64). In between, a Swedish nobleman, Karl VIII. Knutsson, was recognized as king during the years 1448–57, 1464–65 and 1467–70 (being twice expelled and twice re-instated). During the years that followed no native-born sovereigns were set up against the Danish kings, but the National Party was under the leadership of *Riksföreståndare,* or Regents, in the persons of members of the Sture family. After *Riksföreståndare* Sten Sture the Elder (1470–97) came the Danish King Hans (1497–1501), then Sten Sture again, (1501–03), and then Svante Sture (1504–12) and Sten Sture the Younger (1512–20). The times were troubled and there were continual struggles with the Danes. Many Germans lived in the towns. After a Swedish victory over the Danes outside Stockholm in 1471 an old ordinance by which the Germans should have half the seats in the town councils was abolished. The country now became impoverished but the national feeling grew stronger than ever alongside a hatred of Denmark which inspired Sweden's foreign policy for 300 years and which was caused by Danish intrigues against Sweden. Things came to a climax when the Danish king Christian II. conquered the country and in 1520 had the foremost men of the National Party in Stockholm executed ("The Stockholm Blood-Bath"). Among noteworthy events in this period may be mentioned the founding of Sweden's first university in Uppsala in 1477.

Gustavus Vasa, 1523–1560.—The Scandinavian Union was represented by the Danish king living in Copenhagen. Denmark and Norway held the south, and foreign trade lay in the hands of the German Hanseatic League. Sweden was a land of peasants, divided by provinces, and inspired by all the local patriotism that troublous times evoke. The Uppsala university had deteriorated, and the affairs of the Catholic Church had long been neglected by the Holy See.

A young Swedish nobleman, Gustavus Eriksson Vasa, who had been treacherously carried off to Denmark as hostage and prisoner, in 1519 made his escape to Lübeck, where he won good friends. At the end of May 1520 he landed again in Sweden near Kalmar, and quickly learnt of the massacre in Stockholm, in which his father and brother-in-law had perished. He made his way up to Dalarna where he raised his first peasant troops. He had neither arms nor money, but one province after another came to his support. Archbishop Gustav Trolle was his foremost opponent but had to take flight from Sweden. Gustavus formed an engagement with Lübeck, which sent ships with arms and soldiers. In June 1523 Gustavus was elected king of Sweden by an assembly in Strängnäs, and Stockholm surrendered to him.

But it was not easy to guard what had been won. Lübeck had secured for herself a monopoly of Sweden's foreign trade as well as exemption from tolls and bonds for very considerable sums in payment for services rendered. Drastic taxation had to be imposed, and the churches and monasteries also were requisitioned for help. Archbishop Gustavus Trolle was a fugitive and the Swedish Church found itself in a state of dissolution. Gustavus Vasa's first appeals to the pope were for bishops of Swedish birth, a new archbishop, and church reformation. No favourable response came from Rome and in these circumstances the king was influenced by Lutherans. The New Testament was translated into Swedish. At the *Riksdag* held in Vesterås in 1527 the church settlement decreed that the bishops had to hand over their castles to the king, and the chapters and canons, moreover, their superfluous incomes; that Peter's Pence should no longer be paid to the pope and that the pope's authority should not be invoked for the election of bishops. The year afterwards the king was crowned in the cathedral of Uppsala.

Gustavus Vasa had to defend the interests of the kingdom against the individual claims of the provinces. The peasants had become disturbed by the novelties of the Reformation, and an adventurer came upon the scene, declaring he was Sten Sture's son. Disturbances broke out but the king put them down with severity. Christian II. had been driven out of Denmark, also and this produced a rapprochement between Sweden and Denmark. Finally Christian was incarcerated in a Danish prison in 1532. Lübeck's privileges had come to be intolerable; on one occasion every church was called upon to hand over its largest bell to supply means for meeting the Lübeck liabilities. This caused a rising in Dalarna, and Lübeck declared war on Denmark and Sweden. They and their German allies took Copenhagen and Malmö. They could not hold out, however, and in 1536 peace was declared. In the following year a treaty was framed between Sweden and Lübeck regarding certain exemptions from tolls but without trade monopoly. Sweden's debts were declared to be settled.

King Gustavus had now to organize administration. He heard talk about Roman law as the basis of all law. He consequently called in a great number of Germans, so that the years 1538–44 came to be known as "the German period"; but the Germans were for the most part adventurers and the results were not satisfactory. The newcomers caused the king to distrust his earlier helpers. There was a dangerous outbreak in Småland, which was led by a peasant, Nils Dacke, who was killed in 1543. The influence of the Germans then ceased, and Gustavus ruled alone. He devoted great attention to mining, trade and agriculture. An influential landed nobility was restrained. At the *Riksdag* meeting of 1560 the king presented his testament. He died on Sept. 30 of that year, aged 63. He was the founder of the new Sweden.

Erik XIV., 1560–1568.—Gustavus Vasa's eldest son succeeded. Scholarly, display-loving, wayward, he ruled well at first but became insane. Gustavus had bestowed on his other sons dukedoms which entailed discords between them. On the occasion of his coronation Erik created the ranks of counts and barons but he was mistrustful of the nobles, upon whom he imposed great exactions. He entered into negotiations for marriage with Queen Elizabeth and afterwards with Mary Stuart, as well as with two princesses on the Continent, but met with refusals. Towards the close of his reign he married his low-born mistress, a good-hearted woman, Karin Månsdotter.

When the Teutonic Knights of Estonia and Livonia ceased to be, the town of Reval and the neighbouring region went over of their own accord to Sweden. This was the first step towards a Swedish sovereignty over the Baltic south of the Bay of Finland. The situation pointed ominously to coming conflicts, for Russia took Narva, the Danish Duke Magnus took Ösel, and Poland took a large portion of the Teutonic Knights' country.

A break with Poland resulted in internal dissensions, as Erik's brother, Johan, who was duke of Finland, married Katerina, the sister of the Polish king, Sigismund Augustus, and as security for a loan to his brother-in-law got some Polish castles in Livonia. A brief civil war took place. Erik's troops took Åbo, and Johan and Katerina were put in prison, after being tried and sentenced by the *Riksdag*. Negotiations were entered into with Ivan the

Terrible in Russia and ended with a proposal for a treaty containing the condition—a blot upon Erik's name—that Duke Johan's wife should be handed over to the tsar, evidently to be used as a means of enforcing concessions from the Polish king. The shameful clause may be ascribed to Erik's madness and was never enforced. A severe conflict ensued with Denmark who wished to have the Union preserved and kept Sweden's "Three Crowns" in her coat of arms. Erik wanted to break the cordon in the south and would not recognize Denmark's claims to supremacy over the Baltic. He ostentatiously added the Danish and Norwegian kingdoms' arms to his own. Other disputes followed, and war resulted in 1563. The Swedish fleet won victories but the Danes had the mastery in the war on land which was waged on both sides with grim ferocity. Lübeck and Poland allied themselves with Denmark. In 1567 Erik's insanity became manifest. He had some of the foremost nobles imprisoned, murdered one of them himself, and had others of them assassinated. He became penitent and set free Duke Johan, who, in alliance with the younger brother Karl and the nobles, dethroned and imprisoned Erik in 1568. He died in prison in 1577.

Johan III. (1568–92), an amiable man, learned in theology, but irresolute and weak, was acclaimed king. The Danish war died a natural death through the economic attrition of both Powers, and in Dec. 1570 peace was declared at Stettin through Polish and French mediation; the frontiers remained the same as before the war. Gottland was allotted to Denmark; Älvsborg on the west coast was to be surrendered by Sweden with a large sum of money; the question of the Three Crowns was left for later decision but in the meantime Denmark was free to incorporate them in her arms, whilst, on the contrary, the Danish and Norwegian arms were to be taken out of the Swedish coat of arms. Sweden's gain consisted in the fact that from this time forward she was to be considered Denmark's equal as a Baltic State. Between Sweden and Poland good relations sprang up at once but war broke out with Russia, waged with changing fortunes and occasionally interrupted by armistices. In the result the whole of Estonia, with Narva, was incorporated with Sweden.

The great religious struggle in Europe was followed with interest by Johan, who sought to take up a mediative rôle and entered into negotiations with the pope. Both papal and Spanish envoys came to Sweden, and it looked as though the king would go over to the Catholic church, but when the pope refused to accept his offer of mediation he changed his tone and entered into definite opposition to Rome. He had previously given out a liturgy which evoked general displeasure in Sweden by its approach to the Catholic form of religious services, and taken as a whole his religious measures caused great unrest. His son Sigismund adopted the Catholic faith and was elected king of Poland in 1587. The internal administration of the country was marked by continual lack of funds (despite high taxation) and at the same time by extravagance over new buildings. Falls in the currency made the matter worse. The nobles were rewarded by special privileges for their part in the overthrow of Erik—a departure from the more democratic policy of Gustavus and Erik. The nobles now showed a tendency to aggrandize their powers but the peasants never became serfs and the *Riksdag* of the four estates continued to be called together. There were serious complications when Johan died in 1592.

Charles IX.—The crown went to Sigismund, who was scantily gifted, obstinate, and a devoted servant of the Catholic Church; his uncle Charles on the other hand was a practical man of affairs, passionate and hard. The evangelical learning had taken still stronger root, and at a Church meeting in Uppsala in 1593 it was decided to abide by the Holy Scriptures, the three great symbols and the unmodified Augsburg Confession. Sigismund was forced to agree. On the day previously, however, he had protested to the papal nuncio against the undertaking and he considered himself entitled to disregard it. He returned to Poland in 1594. Duke Charles and the council soon fell out, with the result that the leading members of the council went off to see Sigismund. In 1598 Sigismund landed with a small Polish army. Sigismund suffered defeat, left hastily for Poland and this caused the Swedish *Riksdag* in 1599 to declare him dethroned. Charles took a sanguinary revenge. The captive members of the council were executed.

Duke Charles was not crowned until 1607. He aimed at a monarchical-democratic conception of Government. During the years 1561–93 the *Riksdag* or other estates were convened 15 times; during Charles's much briefer reign, 1594–1611 they were called together 16 times. New Church dissensions were caused by the fact that Charles cherished Calvinistic ideas while the clergy and the people expressed themselves more and more strongly in favour of evangelical tenets. By the peace with Russia concluded at Teusina in 1595 Sweden's ownership of Estonia and Narva had been recognised, but the troublous times in the East evoked new conflicts. Swedish troops marched into Moscow and the Russian crown was offered to one of Charles's sons Novgorod was conquered. War with Poland was waged in Livonia, where the Poles won certain advantages without being able to turn them to account. Owing to Charles's endeavour to extend the region of Finnmark up to the Arctic under the rule of Sweden, and from other causes, war broke out with Denmark in 1611 and Kalmar was taken by the Danes When Charles died in 1611 he left to his son, Gustavus Adolphus, an inheritance of three unfinished wars.

THE 17TH CENTURY

Gustavus Adolphus had been given a thorough classical education and spoke Latin and several modern languages. He was an organiser of great capacity alike in military and in internal administration. His personal influence was due to a strong and good character and a clear and far-sighted vision In all his work he had assistance of extraordinary value from his Chancellor of State, Axel Oxenstjerna (*q.v.*)

Gustavus Adolphus.—Gustavus Adolphus was born in 1594 and was declared of age on his father's death The Danes were successful in the war and took the harbours on the west coast. Through the mediation of King James I of England peace was concluded in 1613: Älvsborg was to be handed back to Sweden in return for a payment of a million dalers within six years; the Finnmark region was given to Denmark-Norway, and the right of the Danish king to use the Swedish Three Crowns in his coat of arms was recognised. The peace conditions were hard

Sweden next desired peace and a fixed frontier with Russia The war was continued until the conclusion of peace at Stolbova —also with King James's mediation—in 1617 Sweden won Eastern Carelia and Ingermanland, whereby land-connection was obtained between Finland and Estonia, but gave up Novgorod During and after these wars a great task of organisation was carried out in Sweden. The council acquired a stronger position as the king's advisers at the head of the administration. Ministerial offices were set up after the French-Burgundian model; a method of judicial procedure was instituted and courts of appeal were established. The nobility was incorporated in the social system as officials of the Government and much was done to improve local administration. The king promised not to begin war or conclude peace or make a treaty with other powers without the sanction of the *Riksdag*. The ransom of Älvsborg made heavy taxes necessary and even so the town of Amsterdam had to help with a loan; the financing of the State and the raising of the loan were based in a high degree on the copper-ore in the Falu mines In Jan. 1619, the ransom-sum was paid and Älvsborg was returned to Sweden. Gustavus Adolphus endeavoured to promote commerce. New towns were founded, of which Goteborg on the west coast was the most prominent (1621). A source of future difficulties lay in the privileges of the nobles; their graduated freedom from taxes—the reward of the servants of the State—was to diminish thereby the State's revenue from taxation: this danger, however, did not present itself until later. The nobility secured the stability which it needed through the founding of the *Riddarhus*, or House of the Nobles, in 1626, in which records were inscribed of the noble families. Higher education was furthered. The University of Uppsala got from the king in 1624 a great donation of lands. Great attention was given to equipment of

the army and navy.

Relations with Poland were settled by armistices until the year 1617 when negotiations led to no result. Sigismund had never abandoned his claim to the Swedish crown and therein lay a menace for the future. Open war began again and Gustavus Adolphus took personal part in it. Livonia and Riga were conquered and for several years the Swedes carried the war into Polish Prussia. Through the mediation of Brandenburg, France and England, a six years' truce was agreed to at Altmark in Sept. 1629; some Prussian seaports continued to be a Swedish possession, the Swedes retaining the right to levy tolls. While the Polish war was in progress the great conflict which was to be known as the Thirty Years' War (*q.v.*) started within the German Kingdom, and Sigismund's efforts were menacing to the religious peace of Sweden. The emperor's troops were sent to Prussia to help Poland. The royal houses of Sweden and Denmark were related to German princes who asked for help. Catholic France sought to check the emperor's increasing influence and negotiated with Sweden and Denmark: the English Government was working to the same end. Christian IV. of Denmark entered into the war but was completely defeated, and Wallenstein's imperial army took up its position on the Baltic; Wallenstein was made duke of Mecklenburg and imperial admiral over the Atlantic ocean and the Baltic; an imperial fleet was to be built. When Stralsund was threatened, Gustavus Adolphus sent help and after long and many deliberations with the council and the *Riksdag* he made his way with 13,000 men to Pomerania in June 1630; he preferred to have Germany as his theatre of war rather than to await an attack in Sweden. When success attended his invasion of the country, France concluded a subsidiary treaty with him at Bärwalde in Jan. 1631. The evangelical princes of Germany took up a dubious attitude at first, and the Swedes were blamed when they did not succeed in relieving the town of Magdeburg which was taken by the imperial general, Tilly. After various negotiations, a decisive victory was won at Breitenfeld in Sept. 1631.

A series of brilliant Swedish successes followed. Gustavus Adolphus held his Court in Mainz and Frankfurt, crossed the River Lech and made his entry into Munich. The emperor had dismissed Wallenstein in 1630, but now took him back into favour, and soon the latter was once again in the field with a strong army. The Swedes vainly stormed his fortified camp at Nuremberg and the brisk war which ensued led to the battle of Lützen in which Gustavus Adolphus met his death on Nov. 6, 1632.

It may be thought a matter for wonder that Sweden, a country with a population relatively so small, should have been capable of so great a political and military expansion as was shown in the Thirty Years' War. The explanation lies partly in an extraordinary national effort to avert an imminent danger. Sweden's armies were made up also in an increasing degree of foreign mercenaries, German, English, and Dutch. In the Polish war a number of excellent Swedish generals had learnt their business, and Gustavus Adolphus was one of the foremost military leaders of the time.

Christina.—The death of Gustavus Adolphus produced a crisis in Germany. His daughter Christina, still a minor, was recognized as queen (1632–54) and the Regency was undertaken by Axel Oxenstierna. It was well that a new treaty was concluded with France in 1633 and that Wallenstein was murdered in Feb. 1634, but in the autumn the Swedes suffered a defeat at Nördlingen which lowered their prestige. In 1635 Saxony concluded peace with the emperor and her example was followed by Brandenburg in 1636; both declared war against Sweden. John Banér (*q.v.*), restored the good name of the Swedish troops by victories at Wittstock in 1636 and Chemnitz in 1639. His successor, Torstensson (*q.v.*), thrice invaded the emperor's dominions and won the second battle of Breitenfeld in 1642. Almost everywhere Swedish interests were opposed by Denmark. Thus Torstensson was ordered, therefore, to leave Bohemia for Denmark in 1643, and Jutland was overrun by Swedish troops. Christian IV. was forced to conclude a peace at Brömesbro in 1645 by which Sweden won Jämtland, Härjedalen, Gottland, Ösel and, for 30 years Halland; exemption from the Öresund tolls was accorded for goods to Sweden and the Baltic provinces. By the Treaty of Westphalia (*q.v.*) Sweden acquired important German possessions—large portions of Pomerania, Wismar, the bishoprics of Bremen and Verden as fiefs of the German empire, and sums of prize-money, rewards for the soldiers. A great number of Swedes had in the course of the war amassed large fortunes; the influence of the nobles in this way had been increased and a chasm had grown between them and the unprivileged classes. This was intensified by the circumstance that many foreigners had entered into Swedish service and had been rewarded with landed estates. Through them, and through the impressions which Swedes had gathered in foreign countries, new ideas regarding the social status of the nobles had become widely prevalent.

The exercise of governmental power and the administration of the State in general were regulated by the constitution of the year 1634. Christina came of age in 1644, but laid down the crown ten years later. Richly endowed by nature, she had acquired much learning and many accomplishments but she was flighty and arbitrary, wont to overload with gifts those who were momentarily in her favour. She went over to the Catholic Church and died in Rome in 1689 after a life not lacking in excitement.

Charles X.—The new king was the son of Charles IX.'s daughter, the Count Palatine Karl Gustav (Charles X. 1654–60), who had been brought up in Sweden, becoming *generalissimus*. The costs of the court were cut down, and in the *Riksdag* of 1655 the nobles agreed that the endowed estates necessary for administration of the kingdom, for defence of the realm, and for working the mines, should return to the Crown, that certain estates bestowed as gifts should acquire the character of fiefs with right of return to a new king, while a fourth of such estates as had been bestowed after the year 1633 should be returned to the Crown. This measure was put into effect at once but ceased to operate during the strenuous war years that followed.

Charles X.'s short reign was occupied by war. With Poland there was as yet no peace; as the Russians had directed an attack against Poland, the king and the *Riksdag* decided to settle the matter by means of a war. Charles X. took Warsaw and Cracow (1655). Poland looked as though lost, but a national rising followed in favour of King John Casimir and two years of fruitless fighting resulted. Charles X. concluded peace with the rising power, Brandenburg, and the Swedish and Brandenburgian armies together won a three days' battle at Warsaw in 1656. In that year the Russians began war and the emperor joined Sweden's enemies, and the following year Denmark, Holland and Brandenburg followed suit. If all these powers could have co-operated closely Sweden's position would have been extremely perilous, but they could not. Charles turned resolutely upon Denmark, took Jutland and led his troops first over the ice to Fyen and then across the islands to Själland. The credit of this military exploit belongs chiefly to the quartermaster general of the army, Erik Dahlberg. Denmark was forced to make peace in 1658 at Roskilde, Sweden receiving Skåne, Halland, Blekinge and Bornholm, Bohuslän and Trondhjems Län. Both kingdoms undertook to make common cause to keep enemy fleets out of the Sound. The king now thought of confronting his other enemies, but as certain negotiations with Denmark did not quite take the turn he expected and the Dutch were busily agitating in Denmark, he guessed that hostilities from this country would follow the moment he had become engaged in the east. He resolved to avoid this danger by completely crushing Denmark and began war anew in Aug. 1658. His policy, however failed, as in Poland, through a contingency with which the statesmen of those days seldom reckoned—the kindling of a national patriotic movement. Copenhagen withstood his attack and Holland sent a fleet which after a fierce struggle with the Swedes relieved the Danish capital. The situation was anxious, and a *Riksdag* was called together at Göteborg. Charles Gustavus died on Feb. 13, 1660 during its session.

Charles XI.—Charles XI. (1660–97), a boy of four, became king at a moment when Sweden was surrounded by enemies. The widowed queen and five officials became regent. The first thing to do was to secure peace with Poland, the emperor and Brandenburg at Oliva in 1660, whereby Sweden's right to hold Livonia was recognized and John Casimir renounced all claim to the

Swedish throne; with Denmark the same year at Copenhagen, whereby Trondhjems Lan and Bornholm went back to Denmark, compensation being given in the case of Bornholm; and with Russia in 1661 at Kardis, confirming the peace of Stolbova. Magnus Gabriel de la Gardie, the chancellor of State, was weak, and none took the lead in the way Axel Oxenstierna had done after the death of Gustavus Adolphus. The nation's defences were allowed to decline although its foreign policy was adventurous. It was desired to obtain subsidies from other powers and a rash treaty was concluded with France in 1672. In this year the king came of age, having reached his 17th year. His education had been neglected and he grew up awkward in his bearing, but he was an ardent patriot and extremely industrious.

The general decadence of Sweden became manifest when her foreign policy led to war with Brandenburg (1674) and Denmark (1675). The war with Brandenburg was ill-managed, and Sweden's military prestige was lowered by a defeat at Fehrbellin in 1675; most of her German possessions were lost. The Danes invaded Skåne where they continued to have many friends. The king took the leadership. On the sea the Danes were successful, but victories at Lund in 1676 and other places saved the southern provinces for Sweden Peace treaties were signed in 1678 and 1679 with the different enemies. France accepted terms which in some respects were humiliating for Sweden. Some smaller regions in Germany were lost, but there was no question of any cessions of land to Denmark

Great portions of the country had been laid waste, the fleet had been destroyed, trade and commerce had suffered, and finances were in disorder A great task lay before the young king and he accomplished it, but it was by the methods of an absolute monarchy. Several *Riksdags* were called—1680, 1682–83, 1686, etc.—but on each occasion its attitude towards the king was more complaisant and it gradually came to leave practically all the questions of legislation and taxation in his hands. An enquiry was held into the conduct of the members of the Regency, who were sentenced to restore or pay large sums of money; and a very drastic confiscation of private estates was taken in hand whereby land and incomes were made to fall to the Treasury. Charles then put the army and navy in good trim. The officers were remunerated by small farms; cavalry were raised by a certain number of assessed farms and the infantry by the landowners. In the year 1681 the Swedish national debt amounted to 44,000,000 dalers in silver, but on Charles' death it was only 11,500,000. Charles married the Danish Princess Ulrika Eleonora, but the two northern States soon fell apart again. In 1681 Sweden entered into treaties with Holland at The Hague with a view to safeguarding the frontiers fixed by the peace treaties of Westphalia and Nijmwegen. The emperor gave his signature to the compact the following year Sweden wanted to draw Holstein into its sphere of interest so as to secure less interrupted communications between her different German possessions. For Denmark it was still more important to hinder the Holstein plans of expansion lest she should be hemmed in on the South The duke of Holstein-Gottorp was Charles XI 's uncle (his mother's brother) and had his support against Denmark He died in 1697, leaving one son, Charles, and two daughters

THE 18TH CENTURY

Charles XII.—For the third time in the 17th century a regency was called on to act, but already Nov 1697, the *Riksdag* declared the 15-year old Charles XII. (1697–1718) of age. At the coronation he placed the crown on his own head and gave no *Kungaförsäkring* (lit King's guarantee). Charles was a gifted but precocious youth who had been grounded in book-learning and military science. He had high morality, but was inclined to obstinacy. In his early youth he was addicted to wild pranks and perilous sports.

Poland, Denmark and Russia were united against Sweden. In March, 1700, the Poles marched on Riga and the Danes against Holstein. The young king showed unusual power and decision. Protected by the English and Dutch fleets he landed on Själland and enforced on Denmark the peace of Traventhal in Aug. 1700. In November the Swedes, under the personal leadership of Charles, won a momentous victory over the Russians at Narva. In the summer of 1701 Charles marched south, drove the Russians and the Saxons back over the Duna and invaded Poland. Charles called upon the Poles to dethrone Augustus who had begun the war. This idea stirred up the national feeling of Poland and won Augustus help from other States. Charles' route went through Kovno in Lithuania to Warsaw and Cracow which he took (1702). After continual but fruitless victories for the Swedes a Polish parliament, not constitutionally formed, declared Augustus dethroned and elected as his successor Stanislaus Leszczynski, a weak man who lacked the strength to defend his own status as king. The Polish parliament concluded peace with Sweden in 1705. In this way Poland became a kind of subject State to Sweden, but Charles miscalculated Sweden's capacity for maintaining such a relationship. During these Polish conflicts the Tsar Peter took town after town in Livonia and Ingermanland, among them Dorpat and Narva. Charles, in the meantime, held that the most important thing was to force Augustus to conclude peace before he took up his stand against Peter, and he carried war into Saxony. The Swedish army was now one of the most famous in Europe, and Charles's power was very great. Leipzig was taken, and Augustus by the peace signed at Altranstädt in Sept. 1706, renounced the Polish throne and allowed Charles to remain some time in Saxony with his army. Augustus was in Lithuania and sought by intrigue to overrule the peace treaties but failed. From different quarters came efforts to benefit by Swedish aid; nearly a dozen German princes sought Charles out and he was visited by some 30 envoys from various courts. The most notable of them was Marlborough, who took note that the Swedish king did not intend to place himself on the side of France in the Western European wars as rumour had declared. Quarrels with the emperor began, but with the help of English and Dutch mediation a peace was concluded in 1707 which secured for Protestants in Schleswig the Church rights promised them in the Peace of Westphalia.

Charles was anxious to come to conclusions with Russia, but he had given the tsar too long to prepare. The Russians had forced their way into Poland but were driven out again, and after a victory at Holovszyn Charles crossed the Dnieper. Adam Ludwig Lavenhaupt was to have come with an army from Livonia to the king's support, but he was delayed and experienced a severe defeat, arriving eventually with a diminished force and without commissariat. Owing to devastations by the Russians it became difficult for the Swedes to provide themselves with necessaries, and when the Cossack, Mazeppa, offered his co-operation Charles concluded a treaty with him in Oct. 1708. Mazeppa did not manage to get his Cossacks to join with him, but Charles advanced into the Ukraine. In an unusually hard winter thousands of Swedish soldiers perished. Charles began to lay siege to Poltava: the battle which followed (June 28, 1709) ended in a Swedish defeat, largely owing to the fact that Charles was wounded in the foot and that his generals were not united. Charles made his way as a fugitive to Turkey and his proud army capitulated at Perevolatschna on July 1, 1709.

The unfortunate Russian campaign made an immense impression both in Sweden and in other countries. Augustus declared the peace with Sweden invalid and marched into Poland. The Danes crossed the Sound and sought to overrun Skaane. The Government in Stockholm put forth all its powers to defend Southern Sweden and Magnus Stenbock won a decisive victory at Helsingborg in Feb. 1710. The Danish troops were taken back to Denmark. The Russians occupied the Baltic provinces completely after they had taken Riga. Meanwhile Charles was busying himself in Bender trying eagerly to bring about a war between the Turks and Russia. His stay in Turkey is difficult to explain; probably he did not want to return until the Russians had been either conquered or weakened. Thrice the Turks began war but without any gain to Sweden. Meanwhile Stenbock made his way to Germany, but though he defeated the Danes at Gadebusch (1712) he was forced to capitulate with his army at Tönningen in 1713. The German possessions, apart from

Stralsund, were taken by the enemy, who was joined by Prussia and Hanover, and the Russians swarmed over Finland.

From Feb. 1713 Charles was held captive by the Turks but after a swift journey in Dec. 1714, he arrived in Sweden. The country was in a sad plight. The population was only 1,250,000 and the burden of the great war was too heavy. The people were oppressed by heavy taxes and services imposed by the State, and worn out by conscription.

During the years that followed Charles XII. strengthened Sweden's defences against the Danes, who received help from a Russian army and threatened an invasion of Sweden. The plan was not carried out, and Charles turned towards Norway to force the Danish king to make peace. While there he was shot on Nov. 30, 1718. In Stralsund Charles had made acquaintance with the Holstein Baron von Görtz who afterwards became his confidant and associate. Unscrupulous and resourceful, Görtz discovered new means of taxation, simplified the State administration and lowered the value of the currency and conducted an adventurous policy abroad. The poverty thus brought about evoked a hatred against him which after Charles' death led to his being tried and executed. With Charles the Swedish supremacy over the Baltic came to an end.

The Swedish forces were withdrawn at once from Norway, one brigade which was sent against Trondhjem experiencing terrible losses in the mountains. The *Riksdag* assembled for the special purpose of putting an end to the absolute power of the sovereign. Charles' sister, Ulrika Eleonora, married to the hereditary Prince Frederick of Hesse, was declared not to be the successor to the throne, but was elected queen (1718–20) on condition that the *Riksdag* alone should have the right to draw up the constitution. The changes effected in the constitution drawn up in 1719 and 1720 and in the *Riksdag* decrees of 1723 were drastic. When the *Riksdag* was not in session the council ruled together with the king who on most questions only had two votes. While the *Riksdag* was sitting decisions on foreign affairs and other matters were made by a secret committee which was formed of members of the three higher estates, the nobles, the clergy and the burghers. The peasants were left in the background but they had to be heard on questions of taxation. Each estate chose its own speaker; in the house of nobles the speaker was called *Landmarskalk*. The membership of the council could only be revoked by law, and this made parliamentary government very primitive because it led to political law-suits.

In 1719 peace was concluded with Hanover on the basis of Sweden's giving up Bremen and Verden and receiving a sum of money in return. In 1720 an arrangement was come to with Prussia, which acquired a large part of Pomerania and also paid up a sum of money. In 1720 also peace was made with Denmark which renounced the regions it had conquered in return for Sweden's undertaking to agree to Denmark's retaining possession of Schleswig. Russian fleets were harrying the coasts of the Baltic and an attack upon Stockholm was with great difficulty warded off. Peace was not concluded until 1721 at Nystad, when Sweden gave up Livonia, Estonia, Ingria and parts of Finland; northern and western Finland was restored to Sweden.

Frederick I.—In 1720 the crown was transferred to the queen's consort Frederick I. (1720–51). The leading statesman down to the end of the 'thirties was Count Arvid Horn, who pursued a prudent peace policy. The State's debts amounted to 60 or 70 million silver dalers, and the emergency currency (*nödmynten*) was working much harm. A State bankruptcy was inevitable, and after this the emergency currency disappeared. With the English Navigation Act as a model, a proclamation was issued in 1724 prohibiting foreign vessels from conveying to Sweden anything except the produce of the countries to which they belonged. The Swedish commercial fleet increased, an East Indian company was formed in 1731 (which caused bad blood in England), new manufactories were founded with support from the State, in particular the textiles industry, thanks to Jonas Alströmer who created the manufactory at Alingsås. A new general law was framed in 1734.

During the first years following the Peace of Nystad Russia sought to intervene in Sweden's internal affairs and Horn therefore in 1726–27 made Sweden a member of the alliance between England, France and Prussia. Indeed, foreign subsidies began to have their ill effects in Sweden. Against Horn's prudent leadership there grew up an opposition which gained ground in 1734 and became victorious in the *Riksdag* of 1738–39. Horn gave up office in Dec. 1738. The victorious party was called *Hattar*, "the Hats" in contradistinction from *Mössorna*, "the Caps."[1] The programme of the Hats favoured war with Russia with a view to winning back the Swedish provinces and power and a more intensive industrial policy; Sweden was to become a great Power politically and economically.

The party of the Hats controlled the fortunes of the country until the '60s, although sometimes strongly opposed by the Caps. They dominated the council from 1739 onwards with Count Karl Gyllenborg as their leader. Conditions seemed favourable for a war with Russia in 1741 and war began. The campaign was badly conducted and the Swedish troops took to flight. Discontented thousands of peasants marched to Stockholm and could only with difficulty be dispersed. At the beginning of the *Riksdag* session in 1742 the Caps were in power, and the peasants now won for themselves a place in the secret committee. An enquiry was set on foot into the actions of the instigators of the war, and two of the generals were condemned to death and executed. The Hats now raised the question of the succession to the throne, the royal couple being childless, and the question soon became bound up with that of the Russian peace as the Russian Empress Elizabeth wished to see Duke Adolphus Frederick of Holstein elected. The peasants particularly wanted to have the Danish crown prince, and a great conflict raged in *Riksdag* circles, much bribing being done by foreigners. In June 1743 peace was concluded at Åbo. Russia retained only a small portion of her conquests in Finland, and Adolphus Frederick was chosen as heir to the Swedish throne. Denmark threatened war and Sweden's impotence became manifest when a Russian army came to the country to protect her against the Danes. While the *Riksdag* was in session there was a split among the Caps, and the council came to include both Hats and Caps. Adolphus Frederick came to Sweden and in 1744 married Louisa Ulrika, sister of the Prussian King Frederick II. Russia's disposition to control the destinies of the country now took on a singularly offensive aspect. Foreign gold filled the coffers of the parties before the *Riksdag* of 1746–47 assembled. The Hats opposed the Russian proceedings resolutely and in this were supported by many of the Caps. Through new elections to the council, the Hats now came definitely into power again, with Anders Johan von Höpken as head of the Government. Some members of the Caps party were charged with treason and the matter was investigated by a commission. This had the effect of diminishing their opposition to the Hats. An alliance was contracted in May 1747 with Prussia and France which improved the situation. The successful party rewarded its friends lavishly and came down heavily upon its foes.

The years which followed were comparatively quiet. The brilliant young noble, Count Carl Gustav Tessin, was president of the council, which was the strongest known within the period of the *Riksdag's* predominance; National defences were strengthened, custom tolls were raised to help industry which was also supported by loans and premiums; agriculture was supported also by loans on easy terms. The improvement secured by these measures was in part apparent only and great credits were extorted from the *Riksbank* which had to increase its issue of notes. Notes depreciated in value and exchange offices were set up to keep the currency at the desired height.

Adolphus Frederick.—King Frederick died in 1751 and was succeeded by Adolphus Frederick (1751–71) who was under the influence of his stronger-minded wife. Controversial pamphlets and journals came out in numbers. Tension between the king and the council increased. A rash effort at a *coup d'état* was made during the *Riksdag* of 1755–56; the royal couple were humiliated

[1]These party names originated in the Progressives nicknaming their opponents—who sacrificed everything to perpetuate an inglorious peace—the "Nightcaps," they themselves receiving their name from the three-cornered hats that they wore as officers.

and an autograph stamp was introduced in order to dispense with the king's personal intervention in the Government. Count Axel von Fersen came to the front as the foremost man in the Hats Party; he was chosen as *Landmarskalk* (*see* above), leading the bureaucracy of the nobles.

Opposition grew therefore among the unprivileged classes against the nobility and the bureaucracy. The State's finances were in a bad way, yet in spite of this the country was let in for a war, on the side of France and Austria, against Frederick II of Prussia (1757), largely owing to the French subsidies. The war was badly managed, but peace was made with Prussia without loss of territory in May 1762 The Caps took office in the *Riksdag* of 1765–66. Russia and Prussia decided in union to support the Swedish constitution, prolong her general state of weakness, and at the same time to work against the French influence. A Russo-Danish alliance was also formed with the purpose of maintaining the Swedish constitution England was on the same side and it is calculated that these powers spent 3,000,000 silver dalers in order to ensure the victory of the Caps, while France's contribution to the Hats amounted to 2 000,000 The corruption was shameful Against the wishes of the royal couple, the Crown Prince married the Danish Princess Sofia Magdalena

The court had helped the Hats during the *Riksdag* and by the king's direct intervention the council was obliged to call together the *Riksdag* which sat from 1769 till 1770 The Caps were now in a minority and their men were left out of the council which was controlled by the Hats The court had been promised that the king's power would be increased but the Hats did not keep their word Nor did the *Riksdag* succeed in solving the great financial problems In Feb. 1771 Adolphus Frederick died Somewhat previously Russia and Denmark had come to an agreement that, should any change be made in the Constitution of Sweden in the direction of increasing the king's power, they would uphold the existing Constitution (December, 1769) by force of arms. Sweden's Constitution therefore seemed to be held in greater value by her enemies than by her own people

Gustavus III. (1771–92) was in Paris at the time of his father's death He returned home to meet the *Riksdag*. The Hats and the court party were receiving money from France, the Caps from Russia and England The parties were of about equal strength At this juncture the king decided to precipitate a change of the constitution Col Jakob Magnus Sprengtporten (*q v*) crossed to Finland to stir up a rising, in which he succeeded but not so quickly as had been expected. Johan Kristoffer Toll (*q.v.*), a superintendent of forests, went to Skaane and won over the garrison at Kristianstad Prince Charles, the brother of the king, also busied himself in Skaane The council got wind of the danger and the king had to act speedily On Aug 19, 1772, he collected round him the officers of the Guard and arrested the council in the royal castle The Stockholm troops declared for him and the people acclaimed him in the streets The king became again head of the government, with the right to appoint officials. It was an attempt to divide the balance of power between the sovereign and the *Riksdag*.

Russia and Denmark were furious but did not begin war, being much influenced by the resolute attitude of France. Gustavus surrounded himself with capable men He was unusually gifted, but too much of a visionary He had a real passion for the theatre but took up his business as king with honest intent; an enquiry into the conditions of governmental offices was set on foot and a number of reforms in the administration were instituted as a result. In order to help the finances distilling was decreed a State monopoly and a number of distilleries were founded on behalf of the Crown This displeased the peasants who wanted to be free to distil and it increased drunkenness Another cause for dissatisfaction lay in the king's efforts to transform the nobility into a court nobility and to manage promotion so as to break the power of the old bureaucracy.

Foreign Policy.—A dispute with his mother discouraged the king He set out for Italy and Paris. A subsidy treaty was concluded with France but he had no great success there. During the *Riksdag* of 1786 the situation became worse; most of the king's measures were rejected. Gustavus turned to foreign policy and Turkey's war with Russia in 1787 seemed to offer favourable conditions He began war with Russia in June 1788.

War with Russia.—The king took command. A sea-fight at Hogland was undecisive and among officers a conspiracy came to be known as the Anjala League. The conspirators opened negotiations with the Russian empress, to bring about peace. News came that Denmark had entered the war as Russia's ally and Gustavus was obliged to hurry back to Sweden. The Swedish people became animated by patriotism and the king talked to the peasants as Gustavus Vasa had done of old England and Prussia brought pressure to bear on Denmark to leave Sweden in peace and a truce was concluded. By the beginning of the following year, 1789, Gustavus was strong enough to have the leaders of the Anjala League imprisoned. The *Riksdag* was called together at the beginning of February. The meeting was a stormy one, the king, supported by the unprivileged estates, driving through the so-called Act of Union and Security which embodied a number of far-reaching constitutional innovations: the council ceased to exist; the king acquired full powers over the administration of the State and the appointing of officials; and the *Riksdag* lost its initiative in legislation Once again the authority of the king became dominant The *Riksdag* became responsible for the national debts, the management of which was placed in the hands of the *riksgäldskontor*, which was dependent on the *Riksdag* and which was given the right to take up new loans and to issue credit notes A number of the leaders of the opposition had been imprisoned in the course of the session Such was the king's second revolution (*See* GUSTAVUS III , WALLQVIST, OLAF)

The Russian war became a war of exhaustion on land During the years 1789–90 there were several sea-fights, the second of which, at Svensksund in 1790, constituted a fine victory under the king's command. In Aug 1790, peace was concluded without modification of frontiers. But Sweden's finances were destroyed and the internal strife brought to a head One result was a conspiracy against the king's life He died on March 29, 1792, from the effects of a murderous attack by Captain J. J. Anckarstrom at a ball in the Opera House on March 16, 1792

Gustavus IV.—At the age of 13 Gustavus IV. Adolphus (1792–1809) became king of Sweden with his uncle Duke Charles as Regent Duke Charles's closest associate was Gustav Adolf Reuterholm (*q v*), a man of great powers of work, but pedantic and of little intelligence The Regency brought order into the higher grades of Government service and sought above all to further the prosperity of agriculture. Reuterholm was not lacking in appreciation of the latest reforms. the freedom of the press was at first increased, but when the horrors of the French Revolution broke out it was restricted, and the repute of the Regency did not stand very high It wavered between a French and a Russian alliance The king, the duke and Reuterholm visited the Russian court in order to arrange a marriage between the king and a Russian princess, but the whole thing fell through when the king refused to give a guarantee of the princess's religious freedom On the basis of a treaty concluded in 1794 between the two countries, the fleets of both Denmark and Sweden sought to protect neutral trade against privateers of England and other nations.

In 1796 Gustavus Adolphus took over the Government himself He was scantily gifted but he knew how to make himself felt and combined obstinacy with passionate temper So bad were the finances that the town of Wismar had to be mortgaged to Mecklenburg in 1801 In the course of a long journey in Germany in the years 1803–04 Gustavus Adolphus came into touch with French emigrants, and was filled with hate of Napoleon. He took part in the coalition against France in 1805–07, with the result that Pomerania and Stralsund were lost. In the Treaty of Tilsit Napoleon and the Emperor Alexander agreed to attack Sweden unless she were willing to declare war against England and to prevail on Denmark to do the same. The army in Finland gave way before the Russians. The strong fortress of Sveaborg was treacherously surrendered without any real struggle. In the Spring the Swedes marched again to the south of Finland and won several

fine victories, afterwards immortalized by the poet Runeberg. In Dec. 1808 the Swedish forces vacated Finland. Gustavus Adolphus's measures became more and more thoughtless and he annoyed even England, his only ally. The feeling grew that the king must be dethroned. Lieut. Colonel Adlersparre started a revolutionary movement in Värmland, but before he reached Stockholm Adjutant General Karl Johan Adlercreutz had secured possession of the king's person (March 13, 1809). The king died in exile in 1837.

The *Riksdag* was called together on May 1 by the provisional Government and it decided to draw up a new constitution and elect a king. A form of Government resulted which in its fundamental parts still (1928) holds good and which is based on a division of power between the ministry, the representatives of the people and the judicature. The king was to be advised by a ministry the members of which were to be appointed by the king but to be answerable to the *Riksdag*. General legislature was to be the work of the king and the *Riksdag*, and the *Riksdag's* control over taxation was confirmed. As soon as this constitution had been adopted Charles XIII. was recognized as king (1809–18). The credit of drafting the new constitution belongs in the first place to Hans Järta.

King Charles was childless and it was necessary to choose a successor to the throne. Public opinion in Sweden at this period occupied itself with Norway's union with Sweden as a compensation for Finland. The *Riksdag* chose as successor to the throne Prince Christian Augustus of Augustenburg who was commander-in-chief in Norway, manifestly in the hopes that the choice would help to bring this union about. The prince declared that he could accept this offer only after a declaration of peace. During the late summer of 1809 the Russian war was extended to the north of Sweden and the Swedish forces met with two defeats. The Russians in the meantime had become weary of the war and in September peace was declared at Fredrikshamn; Sweden lost Finland and Åland. Soon treaties of peace followed with her other enemies. Pomerania was returned to Sweden.

The heir to the throne, who took the name of Charles, died suddenly in 1810, and a *Riksdag* at Örebro had again to deal with the question of a successor. Opinions were divided when a suggestion was made that they should elect one of Napoleon's marshals, Jean Bernadotte, prince of Ponte Corvo. It seemed certain that Napoleon would approve and accordingly Bernadotte was chosen and assumed the name of Charles John. He is the founder of the present Swedish dynasty, the succession to the throne having been provided for in an ordinance passed in 1810. The old King Charles XIII. had shown courage and patriotic feeling during Gustavus III.'s war with Russia, but he was not very intelligent and he lacked strength of character. The crown prince therefore began to exert considerable influence, with stimulating and beneficent results.

In 1811 Napoleon prepared to break down Russia's resistance. A great war began, and the crown prince perceived that Sweden could not possibly go into it with France against England and Russia. He seems early to have thought out his plans for the conquest of Norway, and in 1812 he brought about a complete change in Swedish policy with this goal in view. Napoleon's occupation of Swedish Pomerania without declaration of war facilitated this change, and Russia and England favoured the idea that Norway should pass over to Sweden from Napoleon's ally Denmark. After the defeat of the French armies in Russia Charles John took part as commander of the northern army in the final conflict and there were Swedish troops also under him. With these the crown prince now made a movement against Denmark, who by the Peace of Kiel (1814) was forced to hand over Norway in return for Pomerania. Herewith begins a new order of foreign policy in Swedish history.

UNION WITH NORWAY: 1814–1905

The project of uniting the Scandinavian peninsula into one kingdom now became a reality. The interests of Sweden's foreign policy lay now more to the west and she was less dependent upon Russia, more dependent upon the western Powers. The Norwegians themselves desired independence for their country and an assembly held at Eidsvold in 1814 framed a constitution and elected Prince Christian Frederick of Augustenburg as king. The Norwegians were forced as the result of a short war to surrender; the prince laid down his crown and a *Storting* which was called together endorsed the union with Sweden. Special conditions affecting the union were framed in the "act of union" passed by the parliaments of both countries in 1815 ("riksakt").

Charles XIV.—More than 100 years of peace followed upon the riksact. The industrial economic revolution proceeded in Sweden as in other countries evolving new classes, which claimed their share in the Government of the country and burst asunder the old methods of representation. The break between the new and the old began during the reign of Charles XIV. and embittered his later years. He was a strong personality capable and lovable, but distrustful of new ideas and apprehensive of too great changes. A Liberal Opposition was formed in the *Riksdag*, above all among the burghers, and took a strong line against the Government's prosecution of newspapers which even amounted to suppression, against bureaucratic formalities, and against the king's tendency to disregard the advice of his ministers. From the '30s onwards there was question of reforms in the matter of the representation of the people and a great many bills were put forward without accomplishing more than a few small reforms. In 1840 the State council was changed by the creation of special departments. With the king's active co-operation the State's foreign debts were paid while internal debts were diminished and in 1834 a regulation of the exchange was affected. Much was done for the canal system; in 1822 one section of the Götha canal was opened and in 1832 the rest of it. In 1842 the board school system was changed.

Oscar I. (1844–59).—Charles was succeeded by his son, a man of gifts and of more open mind but of less strength of will than his father. During the earlier years of his reign he stood for a policy of reform but later he changed noticeably towards conservatism. During the last two years of his life he was ill, and the administration was taken in hand by his son Charles. The restrictions on agriculture and commerce were relaxed; the gild system was done away with in 1846; the old rules for only allowing trade to the towns were removed. By decisions reached in the *Riksdag* for 1844–45 the right to suppress newspapers was definitely abrogated. In 1847 an important poor law system was introduced. One of the greatest questions of that period was that of communication; railways had to be built, but there were differences of opinion as to the laying down of the main lines through the sparsely inhabited land. In the *Riksdag* of 1853–54 it was decided that the main lines should be built by the State and the direction of the work was placed in the hands of Col. Nils Ericson. Friends of reform concentrated more and more on the demand for a thorough-going change in the formation of the *Riksdag* and many proposals were submitted without any of them being accepted. The revolutionary movement which marked the year 1848 on the continent set brains on fire also in Sweden and some street disturbances occurred in Stockholm. The Government produced a new scheme of representation, which, however, was rejected by the *Riksdag* of 1850. A strong Scandinavian movement manifested itself especially in Denmark and Sweden, although the Norwegians also took part in it; great meetings of students were held, but no programme for the unity of the Scandinavian countries with any real life in it was ever framed. When the Schleswig question led to war between Denmark and the German States, a Swedish army was collected together in Skaane and troops were carried over to Fyen, in case Jutland should be invaded; but they never had occasion to come into action. During the Crimean War Sweden and Norway maintained neutrality. In Nov. 1855 they reaped the benefit: a treaty was concluded with England and France by which the Union States undertook not to cede any portion of their territories to Russia while the two other powers undertook to prevent any Russian efforts in that direction (the November treaty). Side by side with the peace treaty in Paris there was concluded a separate agreement between Russia, France and England in

which Russia undertook not to fortify the Åland Islands.

The increasing consumption of spirits due to the right to distil for household needs, called forth anxiety and led to a temperance movement conducted by warm-hearted individuals like Peter Wieselgren, a pastor. Private distilleries were done away with by the *Riksdag* of 1853–54 and the distilling of spirits was regulated by the State. Ever since the middle of the 19th century the question of temperance had affected parties

Charles XV.—The crown prince had conducted the Government for two years when he became king under the name Charles XV (1859–72). He was a fascinating man who by his liveliness of mind, personal friendliness and artistic temperament won great popularity, but he lacked the thoroughness and perseverance in work and the seriousness which are called for in a statesman. His undeniable gifts were bound up with an extravagant imagination which in certain situations was a danger This became most noticeable in the German-Danish war of 1863–64, when he gave the Danes distinctly to understand that they could count on an alliance between Denmark and Sweden-Norway, an idea which had never had the sanction of the State councils of either of the Union countries and which was never to be realized A number of Swedes did however enter the Danish army as volunteers.

The social changes which had come about in the life of Sweden necessitated a new form of electoral representation and increasingly the general feeling was that it must be solved by giving up the division into four estates and that a *Riksdag* with two chambers should be founded instead The minister of justice, Louis De Geer (*q v*) took the lead in the matter and the Government submitted a bill in the *Riksdag* of 1862–63

The new constitution was finally accepted by all four estates in the *Riksdag* of 1865–66; this consisted of two chambers, which, unlike the English houses of parliament, have in most respects similar powers and also exercise a veto on each other in questions of legislation; in the event of conflicting divisions on questions of finance a joint vote is taken Members of the first chamber were elected by the provincial assemblies (*landsting*) together with the town councillors of the larger towns for nine years; the second chamber was elected by collective vote (without any division of the electors into classes), a certain census being necessary for the right to vote In Jan 1867 the first *Riksdag* of this kind was assembled and it soon became evident that it was the peasants who had benefited most by the reform; within a couple of years they dominated the second chamber and their party—the so-called Lantmanna party—was a power to reckon with. The *Riksdag* now meets every year

Through the influence of the finance minister, Baron J. A. Gripenstedt, Sweden was led more in the direction of free trade, and its treaty of commerce with France in 1865 was an epoch-making event in the development All duties on grain were done away with The right of trading was extended in 1864 Among more important reforms may be mentioned the new criminal law and the new maritime law of 1864 The wars which were in progress on the continent caused the *Riksdag* to grant large sums for armaments but the Government's proposal for a reorganization of the national defences was rejected After a prolonged illness Charles XV died in Sept 1872 and was succeeded by his brother Oscar II. (1872–1907). The most noteworthy event in the latter's reign was the dissolution of the Union with Norway.

Dissolution of the Union.—The Union plans of 1815 were never quite clear, and great doubts had always existed regarding the documents in question and their precise bearing The Norwegians, apprehensive of Swedish domination, had sought always to give the narrowest possible application to the provisions of the Act of Union, while the Swedes, generally speaking, sought to give them a wider application, although with increased powers for Norway.

The first great crisis arose over the question of the post of Ståthållare, or Governor, of Norway At first this post had been held by Swedes, but as this had invited opposition they were succeeded by Norwegians In 1859 the *Storting* resolved to abolish the post altogether but in Sweden it was contended that as the post was provided for in the Act of Union it could not be done away with by Norway alone. The question was shelved for a time and in 1873 Oscar II. sanctioned the resolution of the *Storting*. The first great union committee met in the '40s and was followed by several smaller committees and in the year 1865–67 by a great committee which worked out a plan for a new agreement between the two kingdoms This was rejected however by the *Storting* in 1871. The position of the sovereign of the two kingdoms was now becoming extremely difficult, because modern parliamentarianism had progressed much further in Norway than in Sweden and the powers of the sovereign had consequently become much less extensive in Norway. Thus the king had been forced to make continual concessions to the Norwegians. In the year 1835 it had been decided that the premier or another member of the Norwegian Government should be called into the Swedish Norwegian ministerial council whenever questions concerning the foreign affairs of Norway alone or both kingdoms should be under discussion In the '80s a dispute arose about this joint ministerial council From 1891 onwards the *Storting* demanded Norwegian consulates for Norway. Also, it reduced the annual grant for the court. Owing to the protectionist demand of Sweden a Swedish-Norwegian joint law (dealing with reciprocal freedom from customs duties) ceased to exist in 1897, and in 1898 the king ratified a decision of the *Storting* to remove the Joint Union emblem in the upper right hand corner of the Norwegian flag; it disappeared afterwards from the Swedish flag. A small union committee put forward in 1902 a proposal for separate consular services but joint Foreign Office. Negotiations took place and in 1903 understanding seemed to be in sight. The Swedish plan provided that the foreign minister might be either a Norwegian or a Swede. But from both sides there came charges of breach of faith and in Norway all parties demanded dissolution of the union. The Swedes were astonished when on June 7, 1905, the *Storting* declared the union with Sweden to be dissolved The *Riksdag* acquiesced in the dissolution of the Union upon certain conditions, such as that Norway should destroy certain frontier fortresses erected near the Swedish frontier, that the regions adjoining the frontier should constitute a neutral zone without fortifications and military manoeuvres, etc King Oscar laid down the Norwegian crown on Oct. 26, 1905.

Oscar II. (1872–1907).—During the first years of King Oscar's reign the question of national defence was the dominant one, the first chamber contending for an improved system and the peasant members in the second chamber making demands which could not for a long time be conceded A number of army organization proposals were rejected, and during the '80s the question of customs duties caused bitter disputes The increasing exportation of grain from the United States and Russia together with the strong industrial competition between all countries resulted in a protectionist movement in Germany and France which extended also to Sweden The second chamber was protectionist and the first in favour of free trade; in 1887 the majority in the first chamber was so small that it would have been possible to bring about a protectionist system by the collective vote of the two chambers. The king then dissolved the second chamber which returned with a majority in favour of free trade The *Riksdag* of 1888 on the other hand accepted the customs system as the general election in the autumn of 1887—through a technical mistake in the election of the free trade candidates in Stockholm—had given the Protectionists a small majority. This issue had profound consequences both in the formation of parties in the second chamber and in other respects. New men came forward, the most conspicuous of whom was the landed proprietor E. G Boström, premier from 1891 to 1900 and 1902 to 1905. The question of the national defences was provisionally settled by the *Riksdag's* decisions in the autumn of 1891 (at an extraordinary session) and in 1901. In the latter year the Swedish military tenure established was completely abolished; the training time of the men liable for military service was increased from 90 to 240 days in the infantry and a longer period in the case of the navy and special branches of the army.

At this period new legislation was necessitated by industrial development and the great increase in the number of industrial

workers. In 1881 the conditions of labour for children in all factories were regulated and in 1889 a law was passed on providing against injury while at work; the former law was amplified in 1900 by one dealing with the condition of industrial work for women and children. Trade unions were formed and collective agreements governing labour conditions were arranged between employers and workers. In 1889 a Social Democratic Party was formed and in the autumn of 1896 Hjalmar Branting was elected to the second chamber as its first Social Democratic member. The Liberals and Social Democrats demanded an extension of the suffrage for the second chamber, but it was not until the severance of the union with Norway had given a strong impetus to a closer national union on new lines that the question came to be decided. The severance of the union led to the formation of the coalition ministry of Christian Lundeberg, a manufacturer, whose task it was to carry out the dissolution of the union. He was followed at the close of the year 1905 by a Liberal ministry with Karl Staaff, a solicitor, as premier. The *Riksdag* of 1906 rejected his suffrage bill, and the ministry resigned. Rear Admiral Arvid Lindman succeeded, with a conservative ministry and succeeded in 1907 in solving the suffrage question on the basis of universal and equal suffrage (with certain exceptions) together with the democratization of the communal scale of voting and proportional voting for both chambers. Among other important decisions may be mentioned the monopoly in the issuing of bank notes accorded to the *Riksbank* in 1897, the restriction of the right of companies to acquire land in Northern Sweden in 1906, and the part ownership of the State in the Grängesberg Company which owned the Lappland iron-ore mines.

Gustav V.—When Oscar II. died on Dec. 8, 1907, the crown fell to his eldest son Gustav V., who still (1928) wears it. Modest and simple in his character, avoiding needless display, but capable of bearing himself with the dignity required by his position, he has been a true king in a democratic epoch. Reforms were carried through, as, for instance, the laws on civil marriages in 1908 and for the protection of the peasants in Norrland in 1909. In the summer of 1909 the country witnessed a great trial of strength between the industrial workers' trade unions and employers' associations, accompanied by strikes, lock-outs and a general strike. The idea of the workers was to set society rocking and the situation was somewhat like that which resulted in England in 1926. But society won the battle; the general strike failed. In the autumn of 1911 the election for the second chamber was held with a doubled electorate and the Lindman ministry gave up office. Karl Staaff formed his second ministry which lasted until Feb. 1914. In the Autumn of 1911 a great committee was set up to enquire into temperance. The Lindman ministry had approved a cruiser of a new type but Staaff's Government set aside their decision. A movement to cover the costs of its construction by private subscription produced a sum of 17,100,000 kr., and the ship was built. The people had been disquieted by the way the Russians were arming in Finland, and with widespread espionage by the Russians in Sweden. A new workman's protection law was passed in 1912, and an Old Age Pension scheme was founded in 1913.

In Feb. 1914, 30,000 peasants met in Stockholm to request the king that the whole question of national defence should be handled simultaneously. The king's answer was favourable, and the Liberal ministry resigned. The king commanded the *landshövding* Hjalmar Hammarskjöld (*q.v.*) to form a new ministry. K. A. Wallenberg became minister of foreign affairs. The second chamber was dissolved and the *Riksdag* reassembled after the election of May 1, 1914. The new Government had a majority in the first chamber but not in the second.

THE WORLD WAR

The World War broke out. To meet the needed expenditure a war tax was levied on all incomes above a certain amount. It was widely, but quite erroneously, believed that Sweden had entered into a treaty with Germany. Sweden issued a declaration of neutrality. The fleet endeavoured to prevent any military operations within Swedish territorial waters.

The Problem of Neutrality.—As the blockade against Germany was intensified, an increasing amount of Swedish goods were detained in England. The black lists of the belligerents, trade espionage and the attempt to force extensive undertakings from importers in neutral countries induced the Swedish Government to put a proposal for a War Trade Law before the 1916 *Riksdag*, under which no undertakings with belligerent Powers could be made without the sanction of the official Swedish authority (Trade Commission). (If this officially recognized undertaking were broken the culprit was severely punished.) Special arrangements were made with the belligerent countries regarding compensation for permission to transport goods. Britain desired to transport over Sweden goods necessary to Russia, and Sweden granted transport licences in return for permission from Britain to import certain foodstuffs and other goods from the west. In Jan. 1915 the Government forbade the transport over Sweden of arms and other war material. Pourparlers between the Swedish and British Governments with the object of improving trade communications between the two countries led to no result. Disputes arose over the British postal censorship and the closing by Sweden of a channel in Öresund. The difficulties brought the three Scandinavian countries into closer touch. In Dec. 1914, King Gustav invited the kings of Norway and Denmark to a conference in Malmö which inaugurated a period of greater friendship.

Many legal and administrative innovations were made. In 1914 a moratorium for debts was introduced, but was soon abolished. Special laws empowered the Government to fix a maximum price for food and other necessities and if necessary to commandeer them. A War Insurance Commission was set up to give state-aided insurance against loss at sea, a Food Commission to take over the import of grain, etc., an Industry Commission to report on industry and later to ration raw materials, etc., an Unemployment Commission, and a Trade Commission to carry out the war trade laws. In Nov. 1915 the first maximum prices were fixed (for grain). A bad fodder harvest and the difficulty of importing maize and other foodstuffs necessitated a great slaughter and export of cattle.

Some circles sympathized with Britain, others with Germany, but nearly all desired neutrality. A little group of "activists" urged intervention on the side of Germany.

The Blockade.—On July 7, 1916 Britain and France ceased to apply the regulations of the Declaration of London regarding neutral trade. The German U-boat warfare was intensified; the closed areas in the North Sea and the blockade of the Central Powers by the Allies created a situation little in accord with international law. During the war 280 Swedish merchant vessels were sunk, chiefly by German submarines, but also by mines and from other causes. The English ports were crowded with confiscated goods. After the Russian revolution in 1917, Britain no longer needed to transport goods over Sweden to Russia; so this means of bargaining fell away.

Negotiations with Britain for import licences led in the spring of 1917 to a temporary agreement whereby Sweden was guaranteed certain imports (including grain) in return for the release from the Baltic of a number of imprisoned vessels belonging to the Entente. Swedish vessels were requisitioned (or were only allowed to sail in Swedish interests on condition that they were replaced by other vessels when required). Finally a commercial agreement was concluded in the spring of 1918, which enabled Sweden to import large consignments of goods in return for handing over merchant vessels up to 400,000 tons dead weight; a certain proportion of the Swedish iron ore export; longer credit for goods purchased in Sweden, and stricter regulations regarding exports to Germany. The increasing difficulties of nagivation in the North sea and the insignificant export from Britain to Sweden, led to an expansion of trade with Germany. Before the War Sweden obtained 91% of her coal from England but during 1916–17 only 27–26%. The remainder was almost entirely supplied by Germany. The dislocation of trade thus largely influenced Sweden's policy.

Import difficulties necessitated still more stringent State measures. In Oct. 1916 sugar was rationed. In 1917 bread cards were

introduced together with State control of the whole grain trade Before the war an average of 183 kilogrammes of wheat and rye were consumed per head The harvest of 1917–18 produced only 84·4 kilogrammes per head. Finally, potatoes and many other commodities were rationed There was a great shortage of meat and bacon, and milk was reserved for children and invalids. The price of food rose rapidly and large sums of money were set aside to provide the poorer classes with goods at cheap rates As the import of coal decreased, special arrangements were made for procuring wood from the forests. All kinds of raw materials, especially lubricants, were scarce.

Government Changes.—The Hammarskjöld ministry was formed against the wishes of the Liberals and the Social Democrats, and these parties commanded a majority in the second chamber of the *Riksdag*. The Government only remained in power so long thanks to its firm neutral policy. Criticism of its trade policy increased, however, and in spite of a huge vote of confidence from 750,000 people, it was unable to co-operate further with the parties of the Left and resigned at the end of March 1917. A new Conservative ministry carried on up to the new elections to the second chamber in the autumn. Carl Swartz, a manufacturer, was prime minister and Admiral Arvid Lindman, a former prime minister, was minister of foreign affairs The food shortage caused considerable unrest and led to a demand for a constitutional reform of a democratic nature. At the autumn elections the Conservatives suffered several losses and Swartz resigned. The Liberal leader, Prof. Nils Edén, formed a ministry. He himself became prime minister and Lord Justice Johannes Hellner, minister of foreign affairs. The ministry included five other Liberals and four Social Democrats. Among them were Hjalmar Branting as minister of finance, and Baron E Palmstierna, afterwards Swedish minister to London, as minister of marine. Branting soon resigned on account of illness.

Finland and the Åland Islands.—In Jan 1918, Sweden recognized Finland as an independent State. The civil war in Finland created a critical situation. There was a demand for military support of the lawful Finnish Government; yet Sweden feared she might be drawn into the war if she assisted the Finns against the Russians. The Government acted with a circumspection which was rather resented by the Finnish "Whites." When the conflict was transferred to Åland, whose inhabitants had voted for adherence to Sweden, Sweden sent a warship to the islands, and a small body of troops to maintain peace. These were recalled when the Germans made the islands their centre for sending assistance to the "Whites" in Finland (*see* ÅLAND ISLANDS).

Swedish Relief Work.—The Swedish Red Cross was active in the adjacent belligerent lands, and Prince Charles, a brother of the king. took a prominent part in the work. Swedish delegates inspected the prison camps of Russia, Germany and Austria and distributed numerous gifts to the prisoners from their respective countries. Arrangements were made for the exchange of invalided prisoners and their transport over Sweden. After the war large numbers of German and Austrian children spent some time in Sweden renewing their health and strength, and Swedish help was given to the impoverished countries When the great famine broke out in Russia a Swedish relief expedition was sent to Samara. The sum total of relief given by Sweden to the various countries amounted to 36,500,000 kroner

MODERN DEVELOPMENTS

The repercussions of the revolution in Central Europe reached Sweden. The *Riksdag* was sitting when the war ended and in order to keep in power, the Government hastened to put forward a programme embodying a far-reaching constitutional reform, which was carried, thanks to the close co-operation of the Government parties (1918–1919). The graduated scale at the communal elections was abolished and equal and universal suffrage introduced. As the first chamber is based on the communal vote, it became automatically more democratic. Women received full political franchise. The Social Democratic party acquired a relative but not an absolute majority in each Chamber.

Growth of Democracy.—The advance made in the political democratization of Sweden is shown by the following table, in which the number of qualified voters and their proportion to the population together with the number of actual voters and their proportion to the number of qualified voters are given for the years 1905, 1911 (after the Lindman Suffrage Reform bill) 1921 (after the application of the suffrage system of 1918, including the introduction of votes for women) and—for the sake of comparison—1924:—

Year	Number qualified to vote	Number qualified to vote in proportion to population	Number of actual voters	Number of actual voters in proportion to those qualified to vote
		%		%
1905	402,099	8·2	217,759	50·4
1911	1,066,200	19·3	607,487	57·0
1921	3,222,917	54·3	1,747,553	54·2
1924	3,338,892	55·3	1,770,607	53·0

It will be noticed at once that an immense democratic wave has swept over the country and carried public opinion with it Dissensions among the middle-class parties—the Conservative, Liberal and the new Bondeforbund (Farmers' League)—further increased the power of the Social Democrats; but lacking an absolute majority, they were obliged to act rather as a Radical middle-class party. The Edén ministry remained in office until March 1920. The liquidation of war-time restrictions and the work of reform continued. A provisional law adopting an eight-hour day in industry and certain other branches of labour, not including agriculture, was passed. The Liberal and Social Democratic members of the Government disagreed on the reform of communal taxation, and the ministry resigned after Sweden's entry into the League of Nations.

Branting now formed his first purely Social Democratic ministry with Palmstierna as minister of foreign affairs This ministry set on foot investigations into projects of socialisation, industrial democracy and control over trusts and cartels. At the second chamber elections the Conservatives and the *Bondeförbund* gained several seats, Branting therefore dissolved his ministry on Oct. 22, 1920 Baron Louis de Geer formed a moderate Conservative ministry, at the head of which Oscar von Sydow replaced him in Feb. 1921. The Government granted large sums for relief work and the support of the unemployed. To carry out the new constitutional reforms fresh elections for both Chambers took place in the autumn

The result favoured the Socialists, especially in the first chamber and in October Branting formed his second purely Social Democratic ministry, in which he himself was both premier and minister of foreign affairs. The economic crisis and the problem of unemployment were the vital questions at the moment, and at the instance of the Government the 1922 *Riksdag* granted what were, according to Swedish ideas, enormous sums of money for the relief of the unemployed The Government finally fell over this question of unemployment. Swedish policy was to provide relief work whenever possible, otherwise to give monetary assistance. Wages for relief work were to be less than ordinary wages and assistance still less. Help was not to be given to workers involved in any conflict (strike or lock-out) The Government and the *Riksdag* interpreted this last clause differently, and Branting resigned in April 1923. During 1922 a referendum on the total prohibition of all alcoholic drinks was defeated.

Controversy on Defence.—Lord Justice Ernest Trygger, the old Conservative leader, now formed a new ministry, whose special task was the solution of the national defence question The 1914 army regulations had not been entirely carried out when the war ended, and the Socialists, especially, felt strongly that the creation of the League of Nations and the fall of the tsardom justified a reduction of armaments. During the 1924 *Riksdag* the Government had brought in a bill for this purpose, but it was not sufficiently drastic for the Social Democrats and the *folkfrisinnade*

(the Radical half of the Liberal Party; the rest still called themselves Liberals). The *Riksdag* threw out the bill, but the Government remained in office until after the second chamber elections in September. As the result did not strengthen the Government, it went out, and Branting formed his third ministry on Oct. 18, 1924, with Prof. Östen Undén as minister of foreign affairs. The Government and the Social Democratic Party suffered a severe loss in the death of Branting (*q.v.*) on Feb. 24, 1925. Rickard Sandler, minister of commerce, succeeded him as prime minister. A Government measure, introducing shorter military service and a reduction of the army, was passed by the 1925 *Riksdag*.

At the close of the session of the 1926 *Riksdag* the ministry fell over the unemployment question after a sharp conflict regarding the *Riksdag's* instructions to the Unemployment Commission and the latter's manner of carrying them out. C. G. Ekman, member of the Board of Directors in the State Bank, had led the Opposition in the *Riksdag* and he now was invited by the king to form a ministry, which remained in office till Oct. 1928. It was made up of *folkfrisinnade*, to which Party the premier belongs, and Liberals, with Eliel Löfgren, the foreign minister, as their foremost man. Both parties together constitute but a small proportion of the number of members of the *Riksdag* but their position in the Centre has made it possible for them to assume the responsibilities of the Government. During the *Riksdag* of 1927 there were undertaken a number of additions to the fleet and a thoroughgoing Radical reform of the Higher School system. In the *Riksdag* of 1928 a measure of reform in respect of communal taxes was carried through. In June 1928 King Gustav's 70th birthday was celebrated with great circumstance. In commemoration of the day a collection of nearly 9,000,000 Kr. was made for use in accordance with the King's decision for the campaign against cancer, just as a similar collection was used in King Oscar's time as a fund to be used in fighting against tuberculosis. At the beginning of October a new Conservative Government was formed by Admiral Lindman.

Foreign Affairs.—When the question of the entry of Sweden into the League of Nations was broached there was considerable opposition, one reason being the non-entry of the United States. The decision to join was, however, carried by a large majority and in March 1920 her entry into the League was officially announced. Among the Swedish representatives at the League Assemblies were Branting, Trygger and Undén. In Sept. 1922 Sweden was given a seat on the council and held it to 1926. The Åland (*q.v.*) question was decided by the League in favour of Finland (June 1921) but the islands received guarantees for the preservation of their Swedish culture. An international convention prohibited any fortification of the islands.

BIBLIOGRAPHY.—A modern and scholarly exposition of the history of Sweden is available in *Sveriges historia till våra dagar*, ed. E. Hildebrand, of which 14 volumes have appeared namely I. O. Montelius, *Forntiden* (1919); II. S. Tunberg, *Äldre medeltiden* (1926); III. G. Carlsson, *Senare medeltiden* (in preparation); IV. E. Hildebrand, *Gustav Vasa* (1920); and V. *Gustav Vasas Söner* (1923); VI. G. Wittrock, *Gustav II. Adolf* (1927); VII. E. Hildebrand and G. Jacobson, *Kristina och Karl X. Gustav* (1926); VIII. R. Fåhraeus, *Karl XI. och Karl XII.* (1921); IX. L. Stavenow, *Frihetstiden* (1922); and X. *Den Gustavianska Tiden* (1925); XI. S. Clason, *Karl XIII. och Karl XIV. Johan* (1923); XII. C. Hallendorff, *Oscar I. och Karl XV.* (1923); XIII. S. J. Boëthius, *Oscar II.*; XIV. K. Hildebrand, *Gustav V.* (1926); vol. xv. has yet to appear, namely, S. E. Bring, *Källor och Litteraturförteckning*, containing a good account of Sweden's older historical literature and index. *See* also K. Setterwall, *Svensk historisk bibliografi*, 1875–1900, 1900–20 (1907 and 1923); H. Schück, H. Almquist, A. Stille and C. Hallendorff, *Svenska Folkets historia* (1914, etc.); C. Grimberg, *Svenska folkets underbara öden*, I.–IX. (1913–24); Emil Hildebrand, *Svenska statsfirfattringens historia* (1896). (K. Hi.)

SWEDENBORG or **SWEDBERG, EMANUEL** (1688–1772), Swedish scientist, philosopher and mystic, was born at Stockholm on Jan. 29, 1688. His father, Dr. Jesper Swedberg, subsequently professor of theology at Uppsala and bishop of Skara, was under suspicion of heterodoxy, as he placed more emphasis on the cardinal virtues of faith, love and communion with God than on dogma. On completing his university course at Uppsala, in 1710, Emanuel travelled in England, Holland, France and Germany, studying natural philosophy and writing Latin verses, a collection of which he published in 1710. In 1715 he returned to Uppsala, devoting himself to natural science and engineering. From 1716 to 1718 he published a scientific periodical, *Daedalus hyperboreus*, a record of mechanical and mathematical inventions and discoveries. In 1716 Charles XII. appointed him assessor-extraordinary on the Swedish board of mines. Two years later he distinguished himself at the siege of Frederikshall by the invention of machines for the transport of boats overland from Stromstadt to Iddefjord, a distance of 14 m. At the death of Charles XII. Queen Ulrica gave him a patent of nobility, by which his name was changed from Swedberg to Swedenborg, the "en" corresponding to the German "von." In the Swedish House of Nobles he spoke on economic subjects—the currency, the decimal system, the balance of trade and the liquor laws (where he was the pioneer of the Gothenburg system). He strongly opposed a bill for increasing the power of the crown. The next years were devoted to his official duties, which involved the visitation of the Swedish, Saxon, Bohemian and Austrian mines. In 1724 he declined the chair of mathematics in the university of Uppsala, on the ground that it was a mistake for mathematicians to be limited to theory. As early as 1721 he was seeking a scientific explanation of the universe, when he published his *Prodromus principiorum rerum naturalium,* and had already written his *Principia* in its first form. In 1734 appeared in three volumes *Opera philosophica et mineralia,* the first volume (his *Principia*) containing his view of the first principles of the universe, a curious mechanical and geometrical theory of the origin of things. The other volumes dealt with (*a*) iron and steel, (*b*) copper and brass, their smelting, conversion and assaying, and chemical experiments thereon.

Swedenborg's voluminous writings were not properly collected and examined until towards the end of the 19th century; it was then seen that in almost every department of scientific activity he was ahead of his time. His work on palaeontology shows him the predecessor of all the Scandinavian geologists. He was also a great physicist and had arrived at the nebular hypothesis theory of the formation of the planets and the sun long before Kant and Laplace; he wrote a lucid account of the phenomena of phosphorescence, and adduced a molecular magnetic theory which anticipated some of the chief features of modern hypotheses. The French chemist, Dumas, credits him with the first attempt to establish a system of crystallography. He was the first to employ mercury for the air-pump, and devised a method of determining longitude at sea by observations of the moon among the stars.

In 1734 he published *Prodromus philosophiae ratiocinantis de infinito et causa finali creationis,* which treats of the relation of the finite to the infinite, and of the soul to the body, seeking to establish a nexus in each case as a means of overcoming the difficulty of their relation. From this time he applied himself to discovering the nature of soul and spirit by means of anatomical studies. He travelled in Germany, France and Italy, in search of anatomical knowledge and, as a result, published his *Oeconomia regni animalis* (London, 1740–41) and *Regnum animale* (The Hague, 1744–45; London, 1745). In no field were Swedenborg's researches more noteworthy than in physiological science. In 1901, Max Neuberger of Vienna called attention to certain anticipations of modern views made by Swedenborg in relation to the functions of the brain, and the university of Vienna appealed to the Royal Swedish Academy for a complete issue of the scientific treatises. Swedenborg showed (150 years before any other scientist) that the motion of the brain was synchronous with the respiration and not with the action of the heart and the circulation of the blood, a discovery the full bearings of which are still unrealized. He arrived at the modern conception of the activity of the brain as the combined activity of its individual cells. The cerebral cortex, and, more definitely, the cortical elements (nerve cells), formed the seat of the activity of the soul, and were ordered into departments according to various functions. His views as to the physiological functions of the spinal cord are in agreement with recent research, and he anticipated modern research on the functions of the ductless glands.

At middle age, Swedenborg left the domain of physical research for that of psychical and spiritual inquiry. Late in life he wrote to Oetinger that "he was introduced by the Lord first into the natural sciences, and thus prepared, and, indeed, from the year 1710 to 1745, when heaven was opened to him." Before his illumination he had been instructed by dreams, and enjoyed extraordinary visions, and heard mysterious conversations. According to his own account, the Lord filled him with His spirit to teach the doctrines of the New Church by the word from Himself; He commissioned him to do this work, opened the sight of his spirit, and so let him into the spiritual world, permitting him to see the heavens and the hells, and to converse with angels and spirits for years; but he never received anything relating to the doctrines of the church from any angel but from the Lord alone while he was reading the word (*True Christian Religion*, No 779). He elsewhere speaks of his office as principally an opening of the spiritual sense of the word. In 1747 he resigned his post of assessor of the board of mines, took up afresh his study of Hebrew, and began his voluminous works on the interpretation of the Scriptures. His life thenceforth was spent alternately in Sweden, Holland and London, in the composition of his works and their publication, till his death, which took place in London on March 29, 1772. He was buried in the Swedish church in Princes Square, St. George's-in-the-East, and on April 7, 1908, his remains were removed at the request of the Swedish government to Stockholm.

Swedenborg never attempted to preach or to found a sect. He believed that members of all the churches could belong to the New Church without forming a separate organization His theosophic system is most briefly and comprehensively presented in his *Divine Love and Wisdom.* The point of view from which God must be regarded is that of His being the Divine Man His *esse* is infinite love; His manifestation or body is infinite wisdom. Divine love is the self-subsisting life of the universe From God emanates a divine sphere, which appears in the spiritual world as a sun, and from this spiritual sun proceeds the sun of the natural world. The spiritual sun is the source of love and intelligence, or life, and the natural sun the source of nature or the receptacles of life; the first is alive, the second dead The worlds of nature and spirit are perfectly distinct, but they are intimately related by analogous substances, laws and forces. In God there are three infinite and uncreated "degrees" of being, and in man and all things corresponding three degrees, finite and created They are love, wisdom, use; or end, cause and effect. The final ends of all things are in the Divine Mind, the causes of all things in the spiritual world, and their effects in the natural world By a love of each degree man comes into conjunction with them and the worlds of nature, spirit and God. The end of creation is that man may have this conjunction and become the image of his Creator and creation. In man are two receptacles for God—the will for divine love and the understanding for divine wisdom—that love and wisdom flowing into both so that they become human

Swedenborgianism is based on the belief in Swedenborg's claims to have witnessed the last judgment, or the second advent of the Lord, with the inauguration of the New Church, through the new system of doctrine promulgated by him and derived from the Scriptures, into the true sense of which he was the first to be introduced. The "doctrines" of the New Church as given in the *Liturgy* (which also contains the "Creed" and "Articles of Faith") are as follows:—

1. That there is one God, in whom there is a Divine Trinity; and that He is the Lord Jesus Christ
2. That a saving faith is to believe on Him.
3. That evils are to be shunned, because they are of the devil and from the devil.
4 That good actions are to be done, because they are of God and from God.
5. That these are to be done by a man as from himself; but that it ought to be believed that they are done from the Lord with him and by him.

Swedenborgians now constitute a widely spread and considerable society, with a regularly constituted ecclesiastical organization and a zealous missionary activity (*see* NEW JERUSALEM CHURCH)

BIBLIOGRAPHY.—Lithographed facsimiles of the mss. of Swedenborg's works were edited by R. L. Tafel, 10 vols. (Stockholm, 1869–70), another edition in 18 vols. was published at the same place (1901–16). Various editions of the single works have appeared, and about forty are available in English, *Heaven and Hell, The Divine Providence* and *The Divine Love and Wisdom* being published in the Everyman series. There are also translations into most European languages as well as into Arabic, Hindu and Japanese.

See R. L. Tafel, *Documents concerning the Life and Character of Swedenborg,* collected, translated and annotated (3 vols., Swedenborg Society, 1875–77); J. Hyde, *A Bibliography of Swedenborg* (Swedenborg Society). Of English lives the principal are those by J. J. G. Wilkinson (1849); E Paxton Hood (1854); W White (1856, rewritten in 1867–68); G. Trobridge (1907). *See* also S. Warren, *Compendium of the Theological Writings of Emanuel Swedenborg* (1885); E. Swift, *Manual of the Doctrines of the New Church* (1885); T. Parsons, *Outlines of Swedenborg's Religion and Philosophy;* J. G. Herder's "Emanuel Swedenborg," in his *Adrastea (Werke zur Phil. und Gesch*, xii.); A Dorner, *Geschichte der protestantischen Theologie* (Munich, 1867); and *Transactions of the International Swedenborg Congress* (London, 1910), summarized in *The New Church Magazine* (August 1910). (A J. G; X.)

SWEDISH LANGUAGE AND LITERATURE. Old Swedish was spoken in (1) Sweden, except the most northerly part (Lappish and Finnish), the most southerly (Skåne, Halland and Blekinge) and certain parts of western Sweden; (2) maritime tracts of Finland, Estonia and Livonia, with their surrounding islands; and (3) certain places in Russia A number of words, almost exclusively personal names (nearly 100), were introduced into the Russian language at the foundation of the Russian realm by Swedes (in 862), and preserved in two Russian documents of the years 911 and 944, though for the most part somewhat influenced by Russian phonetic laws Of about the same date, are the runic inscriptions, amounting in number to about 2,000 cut on stones (rarely wood, metal or other materials) almost all over Sweden, most frequently (about half of the total number) in the province of Uppland For the most part they occur on tombstones or monuments in memory of deceased relatives; rarely they are public notices. Their form is often metrical, in part at least These inscriptions vary in age, belonging to all centuries of Old Swedish, but by far the greatest number of them date from the 11th and 12th centuries The oldest are perhaps the Ingelstad inscription in Östergotland, the Sparlosa inscription in Vastergotland, and the Gursten one found in the north of Småland, all probably from the end of the 9th century The rune-stone from Rok in Östergötland probably dates from about A D 900 Its inscription surpasses all the others both in length (more than 750 runes) and in the importance of its contents; it is a fragment (partly in metrical form) of an Old Swedish heroic tale From the beginning of the 12th century is the remarkable inscription on the door-ring of the church of Forsa in Helsingland, containing the oldest Scandinavian statute now preserved, as well as other inscriptions from the same province, written in a particular variety of the common runic alphabet, the so-called "staflösa" (staffless, without the perpendicular staff) runes, as the long genealogical inscription on the Nalstad-stone. Of runic literature nothing has been preserved to our days The literature in the Latin letters is in quality and extent inferior to Old Icelandic, though it, in quantity, considerably surpasses Old Norwegian In age, it begins only in the 13th century The oldest of the extant manuscripts is a fragment of the Older Västgötalaw, written about the year 1250 A complete codex (Cod Holm B 59) of the same law dates from about 1285. The very numerous Old Swedish charters, from 1343 downwards, are also of great importance.

Form of the Language.—Old Swedish, during its earliest preliterary period (800–1225), retains quite as original a character as contemporary Old Icelandic and Old Norwegian. The formal changes of the language during this period are, generally, such as appear about the same time in all the members of the group—as the change of soft R into common *r* and the change of *sþ* into *st* (in the 10th century *raisþi*, later *ræisti*, raised); or are, at least, common to it with Norwegian—as the dropping of *h* before *l, n* and *r* (in the 10th century *hrauR*, younger, *rør*, cairn), and the changing of nasal vowels (the long ones latest) into non-nasalized But during the classical period of Old Swedish (1225–1375), the time of the later runic inscriptions and the oldest literature, the language

is already distinctly separate from the (literary) Icelandic-Norwegian (though not yet very much from Danish). As innovations in Swedish:—*d* is inserted between *ll* (*nn*) and a following *r* (as *b* between *m* and *l, r,* and *p* between *m* and *t, n*); an auxiliary vowel is inserted between final *r* and a preceding consonant; *a* in terminations is often changed into *æ;* a *u* in the final syllable causes no change of a preceding *a;* the present tense takes the vowel of the infinitive (and the preterite subjunctive that of preterite indicative plural). There were other important changes.

The borrowed words are chiefly ecclesiastical and of Latin and Greek origin. At the middle of the 14th century the literary language develops to a *"rikssprâk,"* a uniform language, common to a certain degree to the whole country. The language at this period is deluged with borrowed words of Low German origin, mostly social and industrial terms. Towards the end of the period a powerful Danish influence extends also to phonetics and etymology, so that nearly all the terminal vowels are supplanted by the uniform Danish *e,* the hard consonants *p, t, k* by *b, d, g* as in Danish, the second person plural of the imperative ends in *-er,* besides *-en* (as *tagher,* for *taghen,* older *takin*).

Dialects.—Dialectical differences occur in the runic inscriptions and in the literature. One distinct dialect, that of the island of Gottland, differs so essentially from the Old Swedish of the mainland that it has been characterized, under the name *Forngutniska,* as in a sense a separate language. Materials for its study are abundant: more than 200 runic inscriptions, and, in literature a runic calendar from 1328, the law of the island (the oldest manuscript is from about 1350), and a piece of traditional history. The language is distinguished from the Old Swedish of the mainland by the following characteristics:—the old diphthongs are preserved and a triphthong has arisen by the change of *iu* into *iau;* the long vowels *æ* and *ø* have passed into *ē* and *ȳ* (as *mēla,* to speak, *dȳma,* to deem); short *o* rarely occurs except before *r,* being in other positions changed into *u; w* is dropped before *r* (as *raiþi,* wrath); the genitive singular of feminines in *-a* ends in *-ur* for *-u* (as *kirkiur,* of the church).

LITERATURE

While the definite beginnings of Swedish literature can hardly be set back to a period farther distant than the 13th century, there is evidence, in the shape of runic inscriptions in which Sweden is extraordinarily rich—the most interesting being the *Rökstene* in East Gotland—that she had her share in the imaginative life of Scandinavia which finds its fullest expression in the early poetry of Iceland. But the Swedish middle ages were veritably dark ages; they are illumined only fitfully by light reflected from the mainland of Europe. The Church did not become a vital force until the middle ages were far advanced, while the orders of knighthood found their way too late to Sweden, and were too ill adapted to conditions there, to take any real root. From 1200 on, however, Swedish students visited in surprising numbers the great centres of European learning, and on their return home founded schools.

The great figure of mediaeval Sweden is St. Brigitta (1303–73), the founder of the monastery of Vadstena on Lake Vener. Her writings, which are exclusively in Latin and consist of accounts of her visions and revelations, were printed at Lübeck in 1492. Her confessor, Mattias (d. 1350), compiled a Latin Bible concordance, which is lost, and he may also have been the author of a paraphrase of part of the Old Testament. Swedish mysticism in the 13th century had a prominent representative in Petrus de Dacia (*c.* 1235–89), and Swedes contributed to the Latin hymn-poetry of the middle ages. There are Swedish versions—the so-called *Eufemiavisor*—of Crestien de Troyes' *Chevalier au lion* (1302), of a now lost German romance of Duke Frederick of Normandy (1308) and of *Flores and Blanscheflor;* not until 1380 do we find another romance of this type, *Konung Alexander.* These, to which should be added some prose romances of the later time (*Didrikssagan, Historia Trojana, Karl Magnus*), are practically all Sweden's contribution to the literature of chivalry.

The most pleasing aspect of Swedish mediaeval literature is the folksong or *folkvisa.* This she shares with the other Scandinavian lands, particularly the songs on mythic themes and the so-called *kämpavisor* of presumably historical origin. Particularly interesting are the Swedish *riddarvisor,* while the dance-songs, so characteristic of the North, seem to have been cultivated in Sweden long after they had died out in Denmark. The early prose literature consists here, as in other lands, of legal codes and chronicles. The Elder West Göta Law (*Äldre Västgötalagen*) is preserved in a ms. of the end of the 13th century; and other similar codes (*Upplandslagen, Södermannalagen,* etc.) date from the 14th. Much the most interesting juridical work of the early time is *Um styrilsi kununga ok höfthinga* (*On the Conduct of Kings and Princes*), which dates from the 13th century, although not printed until 1634. Besides Latin chronicles there is one in the vernacular, *Erikskrönika,* dealing with the period from about 1250 to 1319; this was followed by others and finally by the three *Sturekrönikorna,* which bring the record of events down to 1496. The oldest work which may be definitely described as history is the *Prosaiska krönikan* of the 15th century and the Latin *Chronica Regni Gothorum* of Erik Olai (d. 1486), the father of Swedish historiography.

The Renaissance.—The 16th century added but little to Swedish literature, and that little is mostly connected with the newly-founded university of Uppsala. The Renaissance scarcely made itself felt in Scandinavia, and even the Reformation failed to waken the genius of the country. The most prominent writers were two brothers, Olavus Petri (1493–1552) and Laurentius Petri (1499–1573), Carmelite monks who adopted the Lutheran doctrine while studying at Wittenberg, and came back to Sweden in 1518 as apostles of the new faith. Olavus became chancellor to Gustavus Vasa, but his reforming zeal soon brought him into disgrace, and in 1540 he was condemned to death. Two years later he was pardoned, and allowed to resume his preaching in Stockholm. He wrote a *Svensk krönika,* which is the earliest prose history of Sweden, a mystery-play, *Tobiae comedia,* which is the first Swedish drama, and three psalm-books. Laurentius Petri, who was a man of calmer temperament, was archbishop of all Sweden, and edited or superintended the translation of the Bible published at Uppsala in 1540. He also wrote many psalms. Laurentius Andreae (d. 1552), had previously prepared a translation of the New Testament, which appeared in 1526. He was a polemical writer of prominence on the side of the Reformers. Finally, Petrus Niger (Peder Svart), bishop of Västerås (d. 1562), wrote a chronicle of Gustavus I. up to 1533, in excellent prose.

With the accession of Charles IX. literature began to assert itself in more vigorous forms. The long life of the royal librarian, Johannes Bure or Buraeus (1568–1652), formed a link between the age of the Petri and that of Stiernhielm. A patient antiquary, Buraeus advanced the knowledge of ancient Scandinavian mythology and language; nor was it without significance that two of the greatest Swedes of the century, Gustavus Adolphus and the poet Stiernhielm, were his pupils. The reign of Charles IX. saw the rise of secular drama in Sweden. The first comedy was the *Tisbe* of Magnus Olai Asteropherus (d. 1647), a coarse but witty piece, acted by the schoolboys of the college of Arboga in 1610. A greater dramatist was Johannes Messenius (1579–1636), who, having been discovered plotting against the Government during the absence of Gustavus in Russia, was condemned to imprisonment for life—that is, for 20 years. Before this disaster he had been professor of jurisprudence in Uppsala, where his first historical comedy *Disa* was performed in 1611 and the tragedy of *Signill* in 1612. The design of Messenius was to write the history of his country in 50 plays of which only six were completed. Messenius was a genuine poet, a fact that is more apparent in the lyrics he introduced into his plays than in the plays themselves. He was imitated by a little group of playwrights. Nikolaus Holgeri Catonius (d. 1655) wrote a tragedy on the Trojan War, *Troijenborgh;* Andreas Prytz (d. 1655) several religious chronicle plays from Swedish history; and Jacobus Rondeletius (d. 1662) a curious "Christian tragi-comedy" of *Judas redivivus.* Another interesting play was an anonymous *Holofernes and Judith* based on German models. These were all acted by schoolboys and university youths, and when such performances went out of fashion the drama in Sweden almost ceased.

Stiernhielm and His Followers.—The greatest literary name of the 17th century was that of Georg Stiernhielm (*see* STJERNHJELM) (1598–1672), a man of many-sided intellectual attainment. His chief literary work, and the greatest Swedish poem of the century, is the epic—or rather didactic allegory—*Hercules* (publ. 1658), written in excellent hexameters.

The claim of Stiernhielm to be the first Swedish poet may be contested by a younger man, but a slightly earlier writer, Gustaf Rosenhane (1619–84), known to literature as Skogekär Bärgbo. If Stiernhielm studied Opitz, Rosenhane took the French poets of the Renaissance for his models, and in 1650 wrote a cycle of 100 sonnets, the earliest in the language (*Venerid,* 1680) Most of the young poets followed Stiernhielm rather than Rosenhane. As personal friends and pupils of the former, the brothers Columbus deserve special attention. Each wrote copiously in verse, Johan (1640–84) almost entirely in Latin, while Samuel (1642–79), especially in his *Odae sueticae,* showed himself an apt imitator of the Swedish hexameters of Stiernhielm, to whom he was at one time secretary, and whose *Hercules* he dramatized. Urban Hiärne (1641–1724) introduced the new form of classical tragedy from France, his best play being *Rosimunda* (1665). Lars Johansson (1638–74), who called himself "Lucidor," was a misanthropic, melancholy poet whose adventurous, unhappy life ended in his being stabbed, like Marlowe, in a midnight brawl at a tavern. His *Flowers of Helicon* bear witness occasionally to a very genuine poetic feeling. Haquin Spegel (1645–1714), the famous archbishop of Uppsala, wrote a long didactic epic in alexandrines, *Guds Verk och Vila* (*God's Labour and Rest,* 1685), with an introductory ode to the Deity in rhymed hexameters. He also takes a high place as a writer of hymns Another ecclesiastic, the bishop of Skara, Jesper Svedberg (1653–1735), wrote sacred verses, but is better remembered as the father of Swedenborg. Peter Lagerlof (1648–99), professor of poetry at Uppsala, cultivated a pastoral vein in his ingenious lyrics *Elisandra* and *Lycillis* Gunno Eurelius, afterwards ennobled with the name of Dahlstjerna (*q.v.*) (1661–1709), early showed an interest in the poetry of Italy. In 1690 he translated Guarini's *Pastor Fido,* and in or just after 1697 published his *Kunga-Skald,* an epic in *ottava rima* in honour of Charles XI.; it is not without real merits, richness of language, flowing metre and a genuine poetic enthusiasm. Johan Runius (1679–1713) has, on the one hand, points of contact with Lucidor, and on the other, often seems a forerunner of Bellman His poetry appears in a collection entitled *Dudaim.*

In prose the 17th century produced but little of importance in Sweden. Gustavus Adolphus (1594–1632) was the most polished writer of its earlier half, and his speeches take an important place in the development of the language. The most original mind of the next age was Olof Rudbeck (1630–1702), the famous author of *Atland eller Manhem,* usually known as *Atlantikan* A man of encyclopaedic interests, he spent nearly all his life in Uppsala, expending ceaseless energy on the practical improvement of the university. His *Atland* which appeared in Latin and Swedish, between 1679 and 1702 contains his antiquarian studies; it was an attempt to summon the past, all the sages of Greece and the bards of Iceland, to prove that Scandinavia was the lost Atlantis. Olof Verelius (1618–82) had led the way for Rudbeck, by his translations of Icelandic sagas, a work which was carried on with greater intelligence by Johan Peringskjöld (1654–1720) the editor of the *Heimskringla* (1697). The French philosopher Descartes, who died at Christina's court at Stockholm in 1650, found his chief disciple in Andreas Rydelius (1671–1738), bishop of Lund, who was the master of Dalin, of the next epoch. His *Nödiga förnuftsöfningar* (5 vols.), appeared in 1718–22.

The 18th Century.—A more brilliant period followed the death of Charles XII. The influence of France and England took the place of that of Germany and Italy. The taste of Louis XIV., tempered by the study of Addison and Pope, gave its tone to the academical court of Queen Louise Ulrica, who founded in 1758 the academy of literature, history and antiquities. Two writers in verse connect this Augustan period in Sweden with the school of the preceding century: Jacob Frese (1691–1729), a native of Finland, whose poems were published in 1726, was an elegiacal writer with an often strangely modern appreciation of nature; while Samuel von Triewald (1688–1743) was the first Swedish satirist; he introduced Boileau to his countrymen. Both in verse and prose Olof von Dalin (*q v.;* 1708–63) took a higher place than any writer since Stiernhielm. He was inspired by the study of his great English contemporaries. His *Svänska Argus* (1733–34) was modelled on Addison's *Spectator,* his *Thoughts about Critics* (1736) on Pope's *Essay on Criticism,* his *Tale of a Horse* on Swift's *Tale of a Tub.* Dalin's style, whether in prose or verse, was of a finished elegance. As a prose writer Dalin is chiefly memorable for his history of Sweden, *Svea rikes historia* (1747–61). His allegoric epic *Svenska friheten* (*Swedish Freedom,* 1742) is in polished alexandrines. When in 1737 the new Royal Swedish theatre was opened, Dalin led the way to a new school of dramatists with his *Brynhilda,* a regular tragedy in the French style, and in his comedy *Den afundsjuke* (*The Envious Man*) he introduced the manner of Molière, or more properly that of Holberg. His songs and satires enjoyed great popularity in their time

The only poet of importance who contested the laurels of Dalin was a woman. Hedvig Charlotta Nordenflycht (1718–63), "The Shepherdess in the North," was the centre of a society which took the name of *Tankebyggare Orden* and included among its members Creutz and Gyllenborg She wrote with facility and grace; and her collection of lyrics *Den sörjande turturduva* (*The Sorrowing Turtledove,* 1743), in spite of affectation, expressed her deep sorrow for the death of her husband after a brief happy married life. In 1744 she settled in Stockholm and opened her famous literary salon Count Gustaf Philip Creutz (*q v*) (1731–85) was a Finlander who achieved an extraordinary success with his idyllic poems, and in particular with the beautiful pastoral of *Atis och Camilla* (1759), long the most popular of all Swedish poems. His friend Count Gustaf Fredrik Gyllenborg (1731–1808) was a more rhetorical and artificial poet His epic *Tåget över Balt* (*The Expedition across the Belt,* 1785) is an imitation, in 12 books, of Voltaire's *Henriade,* and deals with the prowess of Charles X He wrote fables, allegories, satires, and a successful comedy of manners, *Den svenska sprätthöken* (*The Swedish Fop*) Anders Odel (1718–73) wrote in 1739 the famous *Song of Malcolm Sinclair,* the *Sinclairsvisa.* In spite of all the encouragement of the court, drama did not flourish in Sweden Among the tragic writers of the age we may mention Dalin, Gyllenborg and Erik Wrangel (1686–1765) In comedy Reinhold Gustaf Modée (1698–1752) wrote three good plays in rivalry of Holberg

In prose, as was to be expected, the first half of the 18th century was rich in Sweden as elsewhere The first Swedish novelist was Jakob Henrik Mork (1714–63) His romances have some points of resemblance with those of Richardson *Adalrik och Göthilda,* which appeared between 1742 and 1745, is the best known; it was followed, between 1748 and 1758, by *Thecla* Jakob Wallenberg (1746–78) described a voyage he took to the East Indies and China under the odd title of *Min son på galejan* (*My Son on the Galley*), a work full of humour and originality Johan Ihre (1707–80), professor at Uppsala, was a philologist of distinction. His masterpiece is the *Glossarium sueogothicum* (1769), a historical dictionary with many valuable examples from the ancient monuments of the language The chief historians were Sven Lagerbring (1707–87), Olof Celsius (1716–94) and Karl Gustaf Tessin (1695–1770) who wrote on politics and on aesthetics. Tessin's *Old Man's Letters to a young Prince* were addressed to his pupil, afterwards Gustavus III.

The two Swedes of widest European reputation in the 18th century were Carl von Linné or Linnaeus, the great botanist, (*q v.;* 1707–78), and the learned and many-sided mystic Emanuel Swedenborg (*q.v ;* 1688–1772). Linné in his books of travel (*Lapplandska resa, Skårska resa,* etc.) pointed the way to a new interpretation of nature, and Swedenborg's mystic communings deeply influenced the imagination of the after-time.

The Gustavian Period.—What is called the Gustavian period commences with the reign of Gustavus III. in 1771 and closes with the abdication of Gustavus IV. in 1809. This period of less than 40 years was particularly rich in literary talent; journalism began to develop; the drama flourished and literature began to

take a characteristically national shape. Gustavus III. (1746–92) was himself a playwright of no mean ability. One of his prose dramas, *Siri Brahe och Johan Gyllenstjerna*, held the stage for many years. But his best work was his national drama of *Gustaf Vasa* (1783), written by the king in prose, and afterwards versified by Kellgren. In 1773 the king opened the national theatre in Stockholm, and on that occasion an opera of *Thetis och Pelée* was performed, written by himself. In 1786 Gustavus created the Swedish Academy, on the lines of the French Academy, but with 18 members instead of 40.

The principal writers are classical and academic. But Carl Michael Bellman (*q.v.;* 1740–95), an improvisatore of the first order, had nothing academical in his composition. His *Fredmans epistlar* (1790) and *Fredmans sångar* (1791), with their riot of bacchanalian humour and fine characterization, are among the greatest of Swedish song books, and unique in the literature of their age. Of the Gustavians in the narrower sense, Johan Gabriel Oxenstjerna (1750–1808) was a graceful idyllist (*Skördarne, The Harvests; Dagens stunder, The Hours of the Day*); Johan Henrik Kellgren (*q.v.;* 1751–95), who assisted the king with his dramas, was a poet and critic of high distinction; while Carl Gustaf af Leopold (1756–1829), another of the king's favourites, carried the Gustavian tradition far into the 19th century. He wrote *Erotiska Oder* (1785), a satire, *Enebomiad* (1795), and two classic tragedies, *Oden* and *Virginia* (1790, 1802). The chief dramatist of the age was, however, Gudmund Göran Adlerbeth (1751–1818) who also made translations of the classics, of Racine and Voltaire and of old Norse poetry. D. G. Björn (1757–1810), C. Envallsson (1756–1806) and Olof Kexél (1749–96) supplied the Gustavian theatre with its comedy. Anna Maria Lenngren (1754–1817) was a very popular writer of graceful domestic verse, chiefly between 1795 and 1800, and a forerunner of modern literary developments.

Two writers of the academic period were definite precursors of the Romantic revival. Bengt Lidner (1757–93), a melancholy and elegiac writer of real poetic inspiration, led a disordered, wandering life which began with an adventurous voyage to the Cape, and died in poverty. He wrote two dramas, *Erik XIV*, and *Medea*, but only a narrative poem, *Grefvinnan Spastaras död* (*The Death of the Countess Spastara*, 1783), has retained its popularity. Thomas Thorild (1759–1808) was a much stronger nature, and led the revolt against prevailing taste with far more vigour. His best poem, *Passionerna*, in hexameters, appeared in 1785, but it is mainly as a prose writer that he is now remembered. He settled in Germany and died as a professor in Greifswald. Karl August Ehrensvärd (1745–1800) may be mentioned here as a critic whose aims somewhat resembled those of Thorild. Among critics of taste may be mentioned Nils Rosén von Rosenstein (1752–1824), the first secretary of the Swedish Academy, who exercised great influence over Swedish literature and thought. His writings include an eloquent argument against Rousseau's theory of the injurious influence of art and letters.

The Romantic Movement.—The excellent lyric poet Frans Mickael Franzén (*q.v.*) (1772–1847), who was deeply influenced by English poetry, and a belated academician Johan David Valerius (1778–1852), fill up the space between the Gustavian period and the domination of Romantic ideas from Germany. It was Lorenzo Hammarsköld (1785–1827) who in 1803 introduced the views of Tieck and Schelling and founded the society in Uppsala called "Vitterhetens Vänner." His chief work was *Svenska vitterheten* (1818, etc.) a history of Swedish literature. Hammarsköld's society was succeeded in 1807 by the famous "Auroraförbundet," founded by two youths of genius, Per Daniel Amadeus Atterbom (1790–1855) and Vilhelm Fredrik Palmblad (1788–1852). These young men formulated the Romantic doctrine in their journals, *Polyfem* and *Fosforos* (1809–13), the latter giving the name "Fosforistena" ("Phosphorists") to their school. Atterbom is the greatest of the purely Romantic poets of Sweden. His chief work is a poetic drama in two parts, *Lycksalighetens ö* (*The Isle of Bliss*, 1824–27) which, although over-long, contains scenes of striking imaginative beauty. Palmblad is the chief novelist of the group. Other leading Phosphorists were Samuel Hedborn (1783–1859); Clas Livijn (1781–1844), author of a remarkable novel, *Spader Dame* (*Queen of Spades*, 1824), and, as a dramatist, a pioneer of Shakespearian influence in Sweden; Adolph Törneros (1794–1839), and Carl Frederik Dahlgren (1791–1844), the last-mentioned a humorist who owed much to the example of Bellman. Fru Julie Nyberg (1785–1854), "Euphrosyne," a poetess of some distinction, was the muse of the school. On the part of the academy the Phosphorists were vigorously attacked by Per Adam Wallmark (1777–1858), to whom they replied in a satire which was the joint work of several writers, *Markalls sömnlösa nätter* (*Markall's Sleepless Nights*, 1820). The most cultured woman of this Uppsala circle was Malla Montgomery-Silfverstolpe (1782–1861), whose exceedingly interesting *Memoarer* was only published in 1908–11.

In 1811 certain young men in Stockholm founded a society for the elevation of literary taste by means of the study of Scandinavian antiquity. This was the "Götiska förbundet" ("Gothic Society"), and its organ was the journal *Iduna* (1811–24). Of its patriotic editors the most prominent were Erik Gustaf Geijer (*q.v.*) (1783–1847); and Esaias Tegnér (*q.v.*) (1782–1846); afterwards bishop of Vexio, and usually regarded as the greatest of all Swedish writers. Eminent as a historian and critic, Geijer has also added, with his *Vikingen, Odalbonder* (*The Peasant Freeholder*) and *Psalmer*, to the treasures of Swedish poetry. Tegnér's copious verse is filled with a noble idealism—at times, perhaps, too rhetorical in its expression—which has closer affinities with the classic tradition of the 18th century than with the Romanticism of his own time. His *Frithiofs saga* (1825), although its sentimentalism is little to the taste of the modern world, was long the most famous of all Swedish poems. To the Gothic Society belonged also Per Henrik Ling (1776–1839), an extreme enthusiast for the Scandinavian past, but now better remembered as the father of gymnastic science than as a poet; Arvid August Afzelius (1785–1871), the first editor of Swedish folk-songs; Benard von Beskow (1796–1868), lyric poet and dramatist; and Carl August Nicander (1799–1839), a poet of distinction who to some extent represents a compromise with the Phosphorists. With the two latter was associated Carl Wilhelm Böttiger (1807–78), a poet influenced in turn by all the greater Romanticists; his unfinished autobiography, *Ungdomsminnen* (*Memories of Youth*), written in his last years, is a masterpiece in its way. Johan Olof Wallin (1779–1839) may be mentioned in the same category, although he is really independent of all schools. He was archbishop of Uppsala and in 1819 published *Den svenska psalmboken*, the national hymn-book of Sweden, a great collection of sacred poetry; 126 of the hymns were written by Wallin himself.

From 1810 to 1840 was the supreme age of Swedish poetry. Second only to Tegnér in genius is Erik Johan Stagnelius (1793–1823). His life and mysterious death have given a romantic interest to all that is connected with his name. His first publication was an epic, *Vladimir den store* (*Vladimir the Great*, 1817), which was followed by a romantic poem, *Blenda*. His dramas, *Bacchanterna* (*The Bacchantes*, 1822), *Martyrerna* (*The Martyrs*, 1821) and the posthumous *Sigurd Ring* are among his most original productions. His mystical lyrics include *Liljor i Saron* (*Lilies in Sharon*, 1812) and his sonnets are the best in Swedish.

Rise of Realism.—Romance began to yield to realism. The first place here belongs to C. J. L. Almqvist (*q.v.*) (1793–1866), whose influence and chequered life recall that of Strindberg. His novels and sketches are collected (14 vols.) under the title *Törnrosens bok* (1832–51). The new realism also appears in Samuel Ödman (1750–1829), and in the descriptions of nature—which recall Linné—of Petrus Laestadius (1802–41) and Nils Lovén (Nicolovius, 1796–1858). Fredrik Cederborgh (1784–1835) revived the comic novel in his *Uno von Trasenberg* (1809–10) and *Ottar Tralling* (1810); and Swedish history supplied themes for the romances of Count Per Georg Sparre (1790–1871) and of Gustaf Herik Mellin (1803–76).

The most popular novelist was Fredrika Bremer (*q.v.*) (1801–65), a native of Finland. Her stories of domestic life owed much to English models, and enjoyed a European reputation inferior only to that of Tegnér's *Frithiofs saga*. Another woman novelist,

Sofia von Knorring (*née* Zelow, 1797–1848) wrote about the same time a long series of aristocratic novels. A polemical writer of great talent was Magnus Jakob Crusenstolpe (1795–1865); while in history, besides Geijer, Jonas Hallenberg (1748–1834) and Anders Magnus Strinnholm (1786–1862) prepared the way for the most widely read of all Swedish historians, Anders Fryxell (1795–1881): *Berättelser ur svenska historien* (1823–80).

With Tegnér the greatest poet of Swedish literature is the Finn, Johan Ludvig Runeberg (*q.v*) (1804–77). Between 1832 and 1844 Runeberg published a series of splendid epics, *Elgyskyttarne* (*The Elk Hunters*), *Hanna, Nadeschda* and *Julgräften* (*Christmas Eve*); in 1848 and 1860 followed the two volumes of *Fänrik Ståls sägner* (*Ensign Stål's Tales*). They achieve wonderful portraits and vigorous metrical swing.

Bernhard Elis Malmström (1816–65) produced in 1840 a volume of elegies, *Angelika;* with two later volumes of poems (1845, 1847) In his literary history he showed himself to be a discriminating critic

Johan Börjisson (1790–1866) was the last of the Phosphorists, author of several romantic dramas; Vilhelm von Braun (1813–60), a writer of humorous verse; "Talis Qualis," a poetical poet and translator of Byron whose real name was Carl Vilhelm August Strandberg (1818–77); Oscar Patrick Sturzen-Becker (1811–69), better known as "Orvar Odd," a lyrical poet who was also the author of a series of excellent sketches of everyday life; and August Blanche (1811–68), the most popular dramatist of the period Fredrik August Dahlgren (1816–95) gained a great reputation with his *Värmlänningarna* (1846), a national drama interspersed with songs and dances, and with his poems in the Värmland dialect Other notable dramatists of the period were Johan Jolin (1818–84) and Frans Hedberg (1828–1908), who in his old age adapted himself in a remarkable degree to modern tastes. A popular novelist of this period was Emilie Flygare-Casten (*née* Smith, 1807–92); indeed, in respect of popularity she entered into Fredrika Bremer's heritage. Her best books deal with the life of the Swedish west coast. The stories and sketches of Karl Anton Wetterbergh (1804–69), known as "Onkel Adam," were much loved in their day, as were the novels of Auguste Blanche and Marie Sofie Schwartz (1819–94). But the most poetically gifted novelist of the later 19th century was the patriotic Finn, Zakris Topelius (1818–98). His long series of romances dealing with Finno-Swedish history appeared between 1850 and 1867 Lyric poetry was represented by Johan Nyborn (1815–89), the poet of Uppsala student-life; Carl Herman Sätherberg (1812–97); Gunnar Wennerberg (1817–1901), the genial improvisator of *Gluntarna* (*The Students*, 1847–50) with its memories of Bellman; and A T Getterstedt (1836–1914), an architect by profession and a poet of fine quality, if of limited range. The dominant force in Swedish philosophy in this period was Kristoffer Jakob Boström (1810–66), the leading journalist Lars Johan Hierta (1801–72), editor of *Aftonbladet* from 1830, a newspaper which marks an epoch in the history of the Swedish press The aesthetic critic and poet, Carl Ruprecht Nyblom (1832–1907) helped materially to mould Swedish taste.

The serenity of Swedish literature was rudely shaken about 1884 by an incursion of modern realism, and an embittered controversy raged between the older generation and the new. The leader of the older school was Viktor Rydberg (*q v*) (1828–95), a writer of many-sided activities, but chiefly remembered as the author of the five novels *Fribytaren på Östersjön* (*The Freebooter on the Baltic*, 1857) *Den siste Athenaren* (*The Last Athenian*, 1859), *Singoalla* (1865) and *Vapensmoden* (*The Armourer*, 1891). He was ably supported by Carl Snoilsky (*q v*) (1841–1903), the greatest of Swedish lyric poets at the close of the 19th century.

Strindberg.—Four influences combined to release Swedish literature from the old hard-bound conventions. These were English thought in the writings of Darwin, Herbert Spencer and John Stuart Mill; French realism in the doctrine and practice of Zola; Norwegian drama as represented by Ibsen and Björnson; and Danish criticism in the essays and monographs of Georg Brandes. Unquestionably the greatest name in recent Swedish literature is that of Johan August Strindberg (*q.v.*) (1849–1912). The significance of his genius may be still under debate, but of one aspect of it there can be no question: he is the master of modern Swedish prose and dramatic dialogue.

Of those who worked side by side with Strindberg the most prominent was Gustaf Geijerstam (1858–1909), who began in 1884 by publishing realistic studies of peasant-life, *Fattigt folk* (*Poor People*) and a novel of Uppsala, *Erik Grane* (1885), which awakened wide interest. These were followed by a long series of popular novels in which psychological problems became increasingly predominant. But before Geijerstam, two women writers had inaugurated the new novel of unidealized actuality. These were Anne Charlotte Edgren-Leffler, subsequently duchess of Cajanello (1849–92), who, from 1882 onwards, published a series of stories (*Ur livet, From Life*) which emphasized the demand for the equality of the sexes; and Victoria Benedictsson ("Ernst Ahlgren," 1850–88), who committed suicide in Copenhagen after achieving marked success with her sketches of humble life in *Från Skåre* (*From Skåre*, 1884) and with the more ambitious novels *Pengar* (*Money*, 1885) and *Fru Marianne* (1887). Of similar tendency are the stories of Alfhild Agrell (b 1849). Associated with Ernst Ahlgren was Axel Lundgård (b 1861) whose novel, *Röde prinsen* (*The Red Prince*, 1889), marks a stage in the development of Swedish fiction. He subsequently turned to the historical novel to which two women, Sofie Elkan (1853–1921) and Matilda Malling (b 1864) have also contributed books which enjoyed a wide popularity. In the '90s descriptive realism in the novel gave place to a finer psychological realism, and a more idealistic—even romantic—tendency The change is to be seen in Geijerstam, and also in the work of Tor Hedberg (b. 1862), son of Frans Hedberg already mentioned. Of his novels, *Judas* (1886) and *På Torpa gård* (1888) may be specially mentioned. The idealistic tendency is most prominent in the novels of the representative Swedish writer at the beginning of the 20th century, Verne von Heidenstam (b. 1859), *Endymion* (1889), *Hans Alienus* (1892), *Karolinerna* (*King Charles's Men*, 1897–98) and *Heliga Brigittas pilgrimsfard* (*St. Brigitta's Pilgrimage*, 1901); and also in the delicate short stories of Per Hallstrom (b. 1866), a writer who passed a considerable part of his youth in America. With Hallström may be associated Ernst Josephson (1857–1906). The greatest of Sweden's living novelists is Selma Lagerlöf (b. 1858), whose masterly *Gosta Berlings Saga* appeared in 1891, and was followed by *Antikrists mirakler* (1897), *Jerusalem* (1901–02), and the delightful journey of *Nils Holgersson* through Sweden on the back of a wild swan (1906–07). In a long series of admirable short stories she has brought world-fame to her native province of Värmland. The poetry of the northern districts of Sweden has been finely expressed in the stories of Pelle Molin (1864–96) and Ludwig Nordstrom (b. 1882), and that of the "Skärgård"—the Stockholm archipelago—discovered for literature by Strindberg, in the writings of Albert Engstrom (b. 1869). A place must also be found for the fine novels of Sven Lidman (b 1882), *Ätten Silfverståhl* (*The Silfverståhls*), and the polished and essentially French talent of Hjalmar Söderberg (b 1869) whose ironic novel, *Martin Bircks ungdom*, appeared in 1901. Of the many contemporary novelists who make a more popular appeal Hilma Angered-Strandberg (b. 1855), Henning Berger (1872–1925), Hjalmar Bergman (b. 1883), Gustaf Jansson (1885–1913), Sigfrid Siwertz (b. 1882) and Elin Wägner seem to have the most serious claim for an abiding place in Swedish literary history. Many of the writers just mentioned, notably Fru Agrell, Fru Edgren-Leffler and Tor Hedberg, have also written for the theatre. To these may be added as dramatists of talent, Harald Johan Molander (1858–1900) and Ernst Didring (b. 1868). But the drama has never been a strong feature in Sweden.

Recent Lyric Poetry.—The particular glory of the last phase of Swedish literature is its lyric poetry. A forerunner of this lyric revival was Albert Ulrik Bååth (1853–1912), in whom the revolt against tradition and conventions is first apparent. His earliest poems appeared in 1879. But the real starting-point for the new lyric was Heidenstram's *Vallfart och vandringsår* (*Pilgrimage and Wanderings*, 1888), which was followed in later years by other volumes of conspicuously beautiful verse. Then, in 1891, ap-

peared *Gitarr och dragharmonika* (*Guitar and Accordion*), the first collection of poems by Sweden's greatest modern lyricist, Gustaf Fröding (1860–1911). It was followed by other collections—notably *Stänk och flikar* (*Sprinklings and Snippets*)—of extraordinary originality, variety and haunting beauty. His later life was overshadowed by mental derangement, which left its mark on his latest work. Another of the leading lyric poets of modern Sweden is Erik Axel Karlpeldt (b. 1864), and indeed, in many respects the most subtle and delicate of them all. His *Friddins visor* (1898), *Fridolins lustgård* (*Fridolin's Garden*, 1901), and *Flora och Pomona* (1906) are the greatest contributions to Swedish poetry of his native province, Dalecarlia. The poetry of Oscar Levertin (1862–1906) introduces an exotic note and recalls in some measure our English Preraphaelites, by whom he was influenced. Of the many eminent lyric talents of modern Sweden, mention can only be made here of Ola Hansson (b. 1860) whose early work (*e.g.*, *Sensitiva amorosa*, 1887) provided an antidote to the harshness of Strindberg's realism; Daniel Fallström (b. 1858); F. Vetterlund (b. 1865); Emil Kleen (1868–98); Bo Bergman (b. 1869); Viktor Ekelund (b. 1880); Per Hallström; Sven Liden; K. G. Ossiannilsson (b. 1875); Gustaf Ullman (b. 1881), and Anders Österling (b. 1884).

Amongst recent literary historians and critics, the most prominent are Oscar Levertin, Henrik Schück, Karl Johan Warburg, Fredrik Böök, Anton Blanck and Martin Lamm; while of writers dealing with social and educational problems, Ellen Key (1849–1926) has, with her *Tankebilder* (*Thought Pictures*, 1898), *Människor* (*Men and Women*, 1899), and *Livslinjer* (*Life Lines*, 1903–06), achieved an international reputation.

Bibliography.—Of older books on Swedish literary history the following have still real value: P. D. A. Atterbom, *Svenska, siare och skalder* (Uppsala, 1841–55); B. E. Malmström, *Granddragen av svenska vittshateus historia* (1866–68); C. R. Nyblom, *Estetiska Studier* (1873–84). The standard history of Swedish literature is H. Schück and K. Warburg, *Svensk litteraturhistoria* (1885, *seq.*; 2nd ed., 1911–16; a 3rd ed. begun in 1926). Excellent is also the *Svenska litteraturens historia* by several collaborators and edited by O. Sylwan (3 vols., 1919–23); in German, Ph. Schweitzer, *Geschichte der skandinavischen Literatur* (Leipzig, 1886–89). There are smaller histories by R. Steffen (5th ed., 1919); H. Schück, *Histoire de la littérature suédoise* (1923); H. de Boor, *Schwedische Literatur* (Breslau, 1924). Indispensable are the many volumes of Oscar Levertin's critical works. An invaluable anthology is provided by the series of 25 vols., *Sveriges nationallitteratur*, edit. by H. Schück and R. Gφrson Berg (Stockholm, 1907–12), and, in smaller compass, R. Steffen, *Översikt av svensk litteraturen* (4 vols., 1918 *seq.*).
(E. G.; J. G. R.)

The Period Since 1910.—Among the more notable novelists of the present day we find on the whole more originality among the women than among the men, some of whom still reflect the influence of Strindberg in certain aspects of their work. Hildur Dixelius-Brettner in her trilogy of three generations, *Prästdottern* (1920), *Prästdotterns Son, Sonsonen* (1922) achieved an admirable unity of feeling, essentially tragic, but tempered by the humour of real life. Elin Wägner came to the fore with *Pennskaftet*, a bright and witty novel of feminist Stockholm; she later established a more permanent reputation with *Åsa-Hanna* (1918) and *Den namnlösa* (1922) which show a deep human sympathy.

The novels of Sigfrid Siwertz are studies in degeneration, marked by sure psychological insight. The most remarkable of them, *Selambs* (1920), Eng. trans. *Downstream* (1922), is a family history of the now classical Rougon-Macquart type, but concentrated in a single generation; the workmanship is of high order, but the picture suffers somewhat from lack of relief. His later novel, *Hem från Babylon*, by drawing on the bizarre and fantastic, gives the impression of a paucity of human material. Among retrospective novels of Swedish life Erik Fahlman's *Firman Åbergson* (1914) stands out as the work of a true artist. The hero is a self-made provincial of the mid-19th century with all the virtues and limitations of his race and time. The texture of the book is extraordinarily light, and the subtlety with which the author has created his atmosphere is altogether admirable. K. G. Ossiannilsson, who began (in a way that is almost a tradition with Swedish writers) as a lyricist, later published a number of novels of contemporary life. He is a writer of originality who has the courage of his opinions and has not shrunk from exposing himself to attack and political isolation by his frankness. His *Bondlandet* (1919), a novel of country life, is a good character study, clearly treated. In *Förtrollningen* (1924) he deals with modern hysteria.

Less clear in his method, but full of vivacity, is Ludvig Nordström, most of whose work bears the general title *Skildringar ur Svenska Nationens Lif*. He is most successful in *Landsorts-bohême* (1912), a thoroughly amusing satire on provincial bohemians, with the editor of a local paper for its central figure. A later work, *Döda världar i Samhällsrymden* (1920), is an ambitious attempt to deal in a fantastically satirical vein with the industrial evolution of Sweden.

Hjalmar Bergman in his best work, *Markurells i Wadköping* (1919), Eng. trans. *God's Orchid* (1924), has succeeded in blending together tragedy, high comedy and farce while never outraging our sense of fitness and psychological probability. This book, the action of which is concentrated into a single day in the life of a provincial town, is something of a *tour de force*, but at the same time a remarkably trenchant study of character. Henning Berger (1872–1925) was a realist of pessimistic outlook, whose strength lay in the delineation of the life of great cities. His best work is the *Dreamland* trilogy, in which he depicts with great variety of treatment the loss of illusions suffered by Swedes of the educated class in America and the brutalising effect of standardisation on the mental and moral character of the individual. Returning to Stockholm in *Fata Morgana* (1911), his banker hero has renounced his ideals and settled down to a comfortable epicurean view of life.

While contemporary literature affords an admirable retrospect of 19th century life and manners, the future historian will only find in it fragmentary and distorted material for a picture of the 20th. Writers in their dread of the commonplace have exaggerated the fantastic, thereby detracting from the documentary value of their work—a fault not peculiar to Sweden.

Bibliography.—Fredrik Böök, *Sveriges moderna litteratur* (1921); Gunnar Jörn, *Svenska diktarporträtt* (Uppsala, 1924). (A. G. Ch.)

SWEELINCK or **SWELINCK, JAN PIETER** (also known as Jan Pieterszoon) (1562–1621), Dutch organist and composer, was probably born at Amsterdam, although his family came from Deventer. It has been persistently stated that he was a fellow pupil with Giovanni Gabrieli and Leo Hassler of the great Andrea Gabrieli in Venice, but this has been disproved by F. H. J. Tiedeman in the *Vereeniging voor Nederlandsche Muziekgegeschiedenis* (Amsterdam 1876). Sweelinck was the son of the organist of the Old Church, Amsterdam, and lived in Holland from about 1577 onward. At a date not later than 1581 he was appointed organist to the Old Church, his father having died in 1573, and this post he held until his death on Oct. 16, 1621.

A complete edition of his works, edited by Max Seiffert with prefaces, was brought out by Breitkopf & Härtel in 1894–1901. *See* also Grove, *Dictionary of Music & Musicians*.

SWEET, HENRY (1845–1912), English philologist, was born in London on Sept. 15, 1845. Educated at King's college, London, Balliol College, Oxford, and Heidelberg university, he was a recognized authority on phonetics, and a readership in phonetics was specially created for him in 1901 by the University of Oxford. He died at Oxford on April 30, 1912.

His works include *Anglo-Saxon Reader* (1866); *Student's Dictionary of Anglo-Saxon* (1897); *A Short Historical English Grammar* (1866); *The History of Language* (1900); and many editions of Old and Middle English texts. The *Collected Papers of Henry Sweet* were edited by H. C. Wyld (1913).

SWEETBREAD, a popular term for certain glands of animals, particularly when used as articles of food; these are usually the pancreas, the "stomach-sweetbread" of butchers, and the thymus, or "breast sweetbread." The term is also sometimes used to include the salivary and lymphatic glands (*see* Ductless Glands, Pancreas and Lymphatic System).

SWEETBRIER (*Rosa Eglanteria* or *R. rubiginosa*), a tall, stiff-stemmed rose, called also eglantine, native to Europe, widespread in Great Britain, and extensively naturalized in eastern North America. The erect, somewhat branching stem, armed with stout hooked prickles, grows usually from 5 to 8 ft. high. It bears fragrant leaves, of 5 to 7 leaflets, and solitary white or pink-

ish flowers, 1 to 2 in. across. While the sweetbrier is infrequently grown for ornament, various hybrids with other roses are in cultivation. (*See* ROSE)

SWEET CLOVER, the popular name for plants of the leguminous genus *Melilotus,* called also melilot, comprising about 20 species, natives of the Old World. They are annual or biennial, sweet-smelling, erect herbs, with pinnate leaves of three usually small, narrow leaflets and small yellow or white flowers, borne in slender axillary clusters (racemes). The white sweet clover (*M. alba*), 3 to 10 ft high, and the similar but larger flowered yellow sweet clover (*M. officinalis*) occur in the British Isles and are widely naturalized in the United States and Canada. A yellow-flowered Eurasian species (*M indica*), 1½ to 3 ft. high, with minute flowers only about $\frac{1}{12}$ in long, has become extensively naturalized in California and other western States. Since about 1900 agricultural varieties of the white sweet clover, as Bukhara clover and Hubam clover (var. *annua*), and also of *M. indica* have been grown as forage, cover and soiling crops in various parts of the United States

For details regarding cultivation, *see* "Sweet Clover," *Leaflet No. 23, U.S. Department of Agriculture.*

SWEET CORN: *see* MAIZE; VEGETABLE; VEGETABLE CULTURE IN THE UNITED STATES

SWEET-GALE (*Myrica Gale*), a shrub of the family Myricaceae, called also gale, sweet willow, bog myrtle and Dutch myrtle, widely distributed in the north temperate zone. It grows usually from 2 to 4 ft high, with numerous twiggy branches; narrow, short-stalked, fragrant leaves; inconspicuous, unisexual flowers, borne in short spikes, and small, waxy-resinous, drupe-like fruits attached to the persistent flowering bracts. The sweet-gale occurs extensively on bogs and moors in the British Isles and widely also throughout the northern United States and Canada The leaves are used as tea and as a country medicine. (*See* MYRICA)

SWEET GUM (*Liquidambar Styraciflua*), a handsome North American tree of the witch-hazel family (Hamamelidaceae), called also red gum, liquidambar (*q v*) and bilsted, found from Connecticut to Missouri and southward to Florida and Mexico It has a straight trunk, sometimes 140 ft. high and 5 ft in diameter, with rough bark, corky-winged branches, large deeply lobed leaves, and drooping, spiny, globose fruiting heads containing winged seeds The hard reddish-brown wood is known to the lumber trade as red gum or satin-walnut. In 1925 the cut of red gum lumber in the United States amounted to 1,100,648,000 bd ft., valued at the mill at $34,549,341. The tree yields liquidambar, called also copalm-balsam, a fragrant gum-resin very similar to the storax produced by *L. orientale* of Asia Minor.

SWEET POTATO, a food plant, known botanically as *Ipomaea batatas,* a member of the family Convolvulaceae (*q.v.*). It is widely cultivated in tropical and warm countries for its tuberous root, which is a valuable article of diet. It is a climbing perennial with entire or palmately-lobed leaves very variable in shape, borne on slender twining stems The flowers are borne on long stalks in loose clusters or cymes, and have a white or rosy funnel-shaped corolla like that of the common bindweed of English hedges The edible portion is the root, which dilates into large club-shaped masses filled with starch The plant is not known in a truly wild state. A. de Candolle believes that it is of American origin, where it has been cultivated from prehistoric times The allusions in the *Merry Wives of Windsor* and other of Shakespeare's plays probably refer to the sweet potato.

The sweet potato is an important food crop in the southern United States where among the root crops its rank is second to the common potato, the total production in 1927 being estimated at 93,928,000 bu , valued at $77,020,960; Texas, Georgia, North Carolina and Louisiana, produced 45% of the total crop

For an account of its cultivation in India, *see* Sir George Watt, *Dictionary of Economic Products of India* (1890). *See* also W. W. Robbins, *The Botany of Crop Plants* (Philadelphia, 1924); L. H. Bailey, *Standard Cyclopedia of Horticulture* (1914–27).

SWEET-SOP or **SUGAR APPLE,** botanical name *Anona squamosa* (family Anonaceae), a small tree or shrub with thin oblong-ovate leaves, solitary greenish flowers and a yellowish-green fruit, like a shortened pine cone in shape with a tubercle corresponding to each of the carpels from the aggregation of which it has been formed. The fruit is 3 to 4 in. in diameter and contains a sweet creamy-yellow custard-like pulp. It is a native of the West Indies and tropical America; it is much prized as a fruit, and has been widely introduced into the Eastern Hemisphere. *A. muricata* is the sour-sop (*q v*). *A. reticulata* is the custard apple (*q v.*), and *A. palustris* the alligator apple.

SWEETWATER, a city of western Texas, U.S.A., on Federal highway 80; county seat of Nolan county. Pop. (1920) 4,307 (91% native white), local estimate, 10,000 in 1928. The district specializes in blooded Hereford stock, and has gas and oil fields. Sweetwater was founded in 1882 and chartered as a city in 1897. It has a commission-manager form of government, a board of city development, and a tax-supported chamber of commerce South of the city are the ruins of Fort Chadbourne, built in 1853

SWELLENDAM, town, situated in the valley of the Breede river, 192 m. E. by S. of Cape Town by rail; 33° 59′ S., 20° 23′ E.; altitude 500 feet. It dates from 1745 In 1795 the people rebelled against the Dutch East India company, proclaimed a free republic and demanded "the absolute and unconditional slavery of all Hottentots and Bushmen " In September of that year Cape Town surrendered to the British, and Swellendam quietly accepted British rule. The town has lost much of its former importance. The population in 1926 included 1,814 whites, and probably a greater number of "coloured" people.

SWETCHINE, MADAME (1782–1857), Russian mystic, whose maiden name was Soymanof, was born in Moscow, and under the influence of Joseph de Maistre became a member of the Roman Catholic Church in 1815 In the following year she settled in Paris, where, until her death, she maintained a famous salon remarkable no less for its high courtesy and intellectual brilliance than for its religious atmosphere. Her *Life and Works* (of which the best known are "Old Age" and "Resignation") were published by M. de Falloux (2 vols , 1860) and her *Letters* by the same editor (2 vols , 1861)

See Sainte-Beuve, *Nouveaux lundis,* vol. i ; and E. Scherer, *Études sur la littérature contemporaine,* vol. i.

SWETE, HENRY BARCLAY (1835–1917), English theologian, was born at Bristol on March 14, 1835, and educated at King's College, London, and Caius College, Cambridge. He was ordained in 1858, and became in 1865 dean of Caius College In 1877 he accepted the college living of Ashdon, Essex, and in 1882 was made professor of pastoral theology at King's College, London. In 1890 he succeeded Westcott as regius professor of divinity at Cambridge, retiring with the title of emeritus professor in 1915 He died at Hitchin on May 10, 1917.

Swete's works on Biblical texts are of the highest importance. In 1887 he published the first volume of his edition of the Greek text of the Old Testament, completing the series in 1894 (3rd ed , 1901–07); in 1898 the Greek text of the Gospel of St Mark with notes and introduction (2nd ed , 1902), and in 1906 that of the apocalypse of St John (2nd ed , 1907). He was the editor of *Cambridge Theological Essays* (1905) and *Cambridge Biblical Essays* (1909), and contributed to Smith and Wace's *Dictionary of Christian Biography* (1882–87) and Hastings's *Dictionary of the Bible* (1899–1900). His historical and critical works include *The Apostles' Creed in Relation to Primitive Christianity* (1894, 3rd ed , 1899); *Church Services and Service Books before the Reformation* (1896); *Patristic Study* (1902); *The Appearances of our Lord after the Passion* (1907, 2nd ed , 1908), and *The Last Discourse and Prayer of Our Lord* (1913).

SWEYN I., KING OF DENMARK (d. 1014), son of Harold Bluetooth, the christianizer of Denmark, by his peasant mistress Aesa, according to the Jomsvikinga Saga, though more probably his mother was Queen Gunild, Harold's consort. The lad was a born champion and buccaneer. His first military expedition, in alliance with the celebrated Jomsborg Viking, Palnatoke, was against his own father, who perished during the struggle (*c* 986). Six years later he conducted a large fleet of warships to England, which did infinite damage, but failed to capture London. During his absence, Denmark was temporarily occupied by the Swedish king, Eric Sersel, on whose death (*c.* 994) Sweyn recovered his

patrimony. About the same time he repudiated his first wife Gunild, daughter of duke Mieszko of Poland, and married King Eric's widow, Sigrid. This lady was a fanatical pagan of a disquieting strength of character. Two viceroys, earlier wooers, were burned to death by her orders for their impertinence, and she refused the hand of Olaf Trygvessön, king of Norway, rather than submit to baptism, whereupon the indignant monarch struck her on the mouth with his gauntlet and told her she was a worse pagan than any dog. Shortly afterwards she married Sweyn, and easily persuaded her warlike husband to unite with Olaf, king of Sweden, against Olaf Trygvessön, who fell in the famous sea-fight off Svolde (1000) on the west coast of Rügen, after a heroic resistance immortalized by the sagas, whereupon the confederates divided his kingdom between them. After his first English expedition Sweyn was content to blackmail England instead of ravaging it, till the ruthless massacre of the Danes on St. Brice's day, Nov. 3, 1002, by Ethelred the Unready (Sweyn's sister was among the victims) brought the Danish king to Exeter (1003). During each of the following eleven years, the Danes, materially assisted by the universal and shameless disloyalty of the Saxon ealdormen, systematically ravaged England, and from 991 to 1014 the wretched land is said to have paid its invaders in ransoms alone £158,000. Sweyn died suddenly at Gainsborough on Feb. 13, 1014. His memory has suffered from the fact that the chief chroniclers of his deeds and misdeeds were ecclesiastics.

See *Danmarks riges historie. Oldtiden og den aeldre middelalder,* pp. 364–381 (Copenhagen, 1897–1905). (R. N. B.; X.)

SWIFT, JONATHAN (1667–1745), dean of St. Patrick's, Dublin, British satirist, was born at No. 7 Hoey's Court, Dublin, on Nov. 30, 1667, a few months after the death of his father, Jonathan Swift (1640–1667), who married about 1664 Abigaile Erick, of an old Leicestershire family. His grandfather, Thomas Swift, vicar of Goodrich near Ross, appears to have lost his possessions by taking the losing side in the Civil War and died in 1658 before the restoration could bring him redress. He married Elizabeth, niece of Sir Erasmus Dryden, the poet's grandfather. The young Swift was supported by his uncle Godwin, a Tipperary official; at the age of six he entered Kilkenny school, where Congreve was a fellow student, and he completed his education at Trinity college, Dublin. Here he exhibited few signs of precocious genius, and it was only by special act of indulgence that he obtained his degree; then, on the death of his uncle, he left Ireland and sought counsel of his mother in Leicester.

His first employment commenced towards the close of 1689, when he became secretary to Sir William Temple, who was living in retirement at Moor Park, near Farnham. His ability gradually won him the confidence of his employer, and he was entrusted with some important missions. In 1694, however, Swift (who had in the meantime obtained the degree of M.A. *ad eundem* at Oxford) quitted Temple, who had, he considered, delayed too long in obtaining him preferment; but it was only after five months' delay, when Swift had unwillingly begged the favour of a testimonial from his discarded patron, that he was able to obtain the small prebend of Kilroot near Belfast (Jan. 1695).

In the meantime he had grown tired of Irish life and was glad to accept Temple's proposal for his return to Moor Park, where he continued until Temple's death in Jan. 1699. His *Pindaric Odes,* written at this period or earlier, indicate the rudiments of a real satirist, but of more importance was his first essay in satiric prose, *The Battle of the Books;* this arose out of a dispute originated in England by Temple's *Essay upon Ancient and Modern Learning,* which argued the superiority of the Ancients over the Moderns. Swift's aim was limited to co-operation in what was then deemed the well-deserved putting down of Bentley by Boyle. Though written in 1697, the satire remained unpublished until 1704, when it was issued with *The Tale of a Tub.*

After Temple's death, Swift suffered several disappointments in attempting to find employment, but he eventually secured the rectory of Agher in Meath with the united vicarages of Laracor and Rathbeggan, to which was added the prebend of Dunlavin in St. Patrick's—the total value being about £230 a year. He was now often in Dublin, at most 20 m. distant, and through Lady Berkeley and her daughters—Lord Berkeley was now a lord justice of Ireland—he became the familiar and chartered satirist of the fashionable society there. But he very soon began to grow tired of Ireland again and to pay visits in Leicester and London. His resolution to exchange divinity for politics must appear fully justified by the result. The *Discourse on the Dissensions in Athens and Rome* (Sept. 1701), written to repel the tactics of the Tory commons in their attack on the Partition Treaties "without humour and without satire," and intended as a dissuasive from the pending impeachment of Somers, Orford, Halifax and Portland, received the honour of being generally attributed to Somers himself or to Burnet, the latter of whom found a public disavowal necessary. In April or May 1704 appeared a more remarkable work. Clearness, cogency, masculine simplicity of diction, are conspicuous in the pamphlet, but true creative power told the *Tale of a Tub.* Although it lacks coherence and attains no conclusion, it is the most strikingly original of Swift's satirical works.

In Feb. 1701 Swift took his D.D. degree at Dublin, and before the close of the year he had taken a step destined to exercise a most important influence on his life, by inviting two ladies to Laracor. Esther, daughter of a merchant named Edward Johnson, a dependant, and legatee to a small amount, of Sir William Temple's (born in March 1680), whose acquaintance he had made at Moor Park in 1689, and whom he has immortalized as "Stella," came over with her companion Rebecca Dingley, a poor relative of the Temple family, and was soon permanently domiciled in his neighbourhood. Meanwhile the sphere of his intimacies was rapidly widening. He had been in England for three years together, 1701 to 1704, and counted Pope, Steele and Addison among his friends. In 1708 he wrote the finest example of his irony, the *Argument to prove that the abolishing of Christianity in England may, as things now stand, be attended with some inconveniencies,* and about this time, too (Nov. 1707), he produced his best narrative poem, *Baucis and Philemon.*

The next few months witnessed one of the most amusing hoaxes ever perpetrated against the quackery of astrologers, the victim being a Protestant alarmist and plot vaticinator styled John Partridge. In Jan. 1708, Swift, under the name of Isaac Bickerstaff, issued a solemn prediction that the notorious almanac maker, Partridge, would die at 11 o'clock P.M. on March 29, and on March 30 he published a letter confirming this prophecy. Partridge's fatuous denial and reply to Bickerstaff elicited Swift's amusing *Vindication of Isaac Bickerstaff, Esq.,* in April 1709. The episode has left a permanent trace in literature, for when, in 1709, Steele was to start the *Tatler,* it occurred to him that he could secure the public ear in no surer way than by adopting the name of Bickerstaff.

From Feb. 1708 to April 1709 Swift was in London, urging upon the Godolphin administration the claims of the Irish clergy to the first-fruits and twentieths ("Queen Anne's Bounty"), already granted to their brethren in England. His having been selected for such a commission shows that he was not yet regarded as a deserter from the Whigs, although the ill success of his representations probably helped to make him one. By Nov. 1710 he was again domiciled in London, and writing his *Journal to Stella,* that unique exemplar of a giant's playfulness. In the first pages of this minute record of a busy life we find him depicting the decline of Whig credit and complaining of the cold reception accorded him by Godolphin, whose penetration had doubtless detected the precariousness of his allegiance. Within a few weeks he had become the lampooner of the fallen treasurer, the bosom friend of Oxford and Bolingbroke, and the writer of the *Examiner,* a journal established as the exponent of Tory views (Nov. 1710). He was now a power in the State and the associate of ministers on a footing of perfect cordiality and familiarity. For a brief time he seemed to resume the whole power of the English press in his own pen and to guide public opinion as he would—his services to his party as writer of the *Examiner,* which he quitted in July 1711, were even surpassed by those which he rendered as the author of telling pamphlets. We need not suppose that he was consulted respecting the great Tory strokes of the creation of

the twelve new peers and the dismissal of Marlborough (Dec. 1711), but they would hardly have been ventured upon if *The Conduct of the Allies* and the *Examiners* had not come first.

Generous men like Oxford and Bolingbroke cannot have been unwilling to reward so serviceable a friend, especially when their own interest lay in keeping him in England. Swift still had formidable antagonists in the archbishop of York, whom he had scandalized, and the duchess of Somerset, whom he had satirized. Anne was particularly amenable to the influence of priestly and female favourites, and it must be considered a proof of the strong interest made for Swift that she was eventually persuaded to appoint him to the deanery of St. Patrick's, Dublin. In June 1713 he set out to take possession of his dignity, and encountered a very cold reception from the Dublin public. The dissensions between the chiefs of his party speedily recalled him to England He found affairs in a desperate condition The queen's demise was evidently at hand and public opinion was turning towards the Whigs when the Tories manifestly could not be trusted to maintain the Protestant succession Bolingbroke's brain teemed with the wildest plans. Swift's mediation was unavailing

When the discord of Oxford and Bolingbroke had become patent to all the nation, Swift, foreseeing, as is probable, the impending fall of the former, retired to Upper Letcombe, in Berkshire, and there spent some weeks in the strictest seclusion. This leisure was occupied in the composition of his remarkable pamphlet, *Some Free Thoughts on the Present State of Affairs*, which indicates his complete conversion to the bold policy of Bolingbroke. The utter exclusion of Whigs as well as Dissenters from office, the remodelling of the army, the imposition of the most rigid restraints on the heir to the throne—such were the measures which, by recommending, Swift tacitly admitted to be necessary to the triumph of his party.

Bolingbroke's daring spirit, however, recoiled from no extreme, and, fortunately for Swift, he added so much of his own to the latter's ms. that the production was first delayed and then, upon the news of Anne's death, immediately suppressed. This incident only just anticipated the revolution which, after Bolingbroke had enjoyed a three days' triumph over Oxford, drove him into exile and prostrated his party. Almost the first acts of Bolingbroke's ephemeral premiership were to order him £1,000 from the exchequer and despatch him the most flattering invitations. The same post brought a letter from Oxford, soliciting Swift's company in his retirement; and, to the latter's immortal honour, he hesitated not an instant in preferring the solace of his friend to the offers of Bolingbroke When, a few days later, Oxford was in prison and in danger of his life, Swift begged to share his captivity; and it was only on the offer being declined that he finally directed his steps towards Ireland, where he was very ill received. The draft on the exchequer was intercepted by the queen's death.

During these four busy years of London life, Swift had entered deeply into the literary life of the period. He was treasurer and a leading member of the Brothers, a society of wits and statesmen which recalls the days of Horace and Maecenas. He promoted the subscription for Pope's *Homer*, contributed some numbers to the *Tatler, Spectator,* and *Intelligencer,* and joined with Pope and Arbuthnot in establishing the Scriblerus Club, contributing to *Martinus Scriblerus*, his share in which can have been but small, as well as *John Bull*, where the chapter recommending the education of all blue-eyed children in depravity for the public good must surely be his. His miscellanies, such as *A Meditation upon a Broomstick*, and the poems *Sid Hamet's Rod, The City Shower, The Windsor Prophecy, The Prediction of Merlin,* and *The History of Vanbrugh's House*, belong to this period A more laboured work, his *Proposal for Correcting, Improving and Ascertaining the English Tongue* (1712), in a letter to Harley, suggesting the regulation of the English language by an academy, is chiefly remarkable as a proof of the deference paid to French taste His *History of the Four Last Years of the Reign of Queen Anne* is not on a level with his other political writings.

To Swift the change from London to Dublin meant for the time the fall from unique authority to absolute insignificance. All share in the administration of even Irish affairs was denied him; every politician shunned him; and his society hardly included a single author or wit. Before and after his elevation to the deanery of St. Patrick's, Esther Johnson and Mrs. Dingley continued to reside near him, and superintended his household during his absence in London. He had offered no obstacle in 1704 to a match proposed for Stella to Dr. William Tisdall of Dublin. Whatever the cause, his conduct proved the fatal embitterment of his life and Stella's and yet another's. He had always been unlucky in his relations with women. Esther Vanhomrigh, "Vanessa" (b. Feb. 14, 1690), the daughter of a Dublin merchant of Dutch origin, had become known to Swift at the height of his political influence. He lodged close to her mother, and Vanessa insensibly became his pupil, while he became the object of her impassioned affection.

But Swift was devoid of passion. Of friendship, even of tender regard, he was fully capable, but not of love, and Vanessa's ardent and unreasoning display of passion was beyond his comprehension. Yet Vanessa assailed him on a very weak side. The strongest of all his instincts was the thirst for imperious domination. Vanessa hugged the fetters to which Stella merely submitted. Flattered to excess by her surrender, yet conscious of his binding obligations and his real preference for Stella, he could neither discard the one beauty nor desert the other. When Vanessa's mother died (1714), she followed him to Ireland, taking up her abode at Celbridge within ten miles of Dublin. Unable to marry Stella without destroying Vanessa, or openly to welcome Vanessa without destroying Stella, he was thus involved in the most miserable embarrassment; he continued to temporize. Had the solution of marriage been open Stella would undoubtedly have been Swift's choice, but some mysterious obstacle intervened

Meanwhile Swift's efforts were directed to soothe Miss Vanhomrigh, to whom he addressed *Cadenus [Decanus] and Vanessa*, the history of their attachment and the best example of his serious poetry, and for whom he sought to provide honourably in marriage, without succeeding either in his immediate aim or in thereby opening her eyes to the hopelessness of her passion Worn out with his evasions, she at last (1723) took the desperate step of writing to Stella or, according to another account, to Swift himself, demanding to know the nature of the connection with him, and this terminated the melancholy history as with a clap of thunder. Stella sent her rival's letter to Swift, and retired to a friend's house. Swift rode down to Marley Abbey with a terrible countenance, petrified Vanessa by his frown, and departed without a word, flinging down a packet which only contained her own letter to Stella Vanessa died within a few weeks. She left the correspondence for publication, but it was suppressed until it was published by Sir Walter Scott. Five years after Vanessa's death Stella died, on Jan. 28, 1728.

Between the death of Vanessa and the death of Stella came the greatest political and the greatest literary triumph of Swift's life. Although he was not an Irish patriot in the strict sense of the word, his pride and sense of equity alike revolted against the stay-at-home Englishmen's contemptuous treatment of their own garrison, and he delighted in finding a point in which the triumphant faction was still vulnerable. His *Proposal for the Universal Use of Irish Manufactures*, published anonymously in 1720, urging the Irish to disuse English goods, became the subject of a prosecution, which at length had to be dropped. A greater opportunity was at hand. A patent for supplying Ireland with a coinage of copper halfpence was accorded to William Wood on such terms that the profit accruing from the difference between the intrinsic and the nominal value of the coins, about 40%, was mainly divided between him and George I's favourite duchess of Kendal, by whose influence Wood had obtained the privilege. Swift now had his opportunity, and the famous six letters signed M. B. Drapier (April to Dec. 1724) soon set Ireland in a flame. Every effort was used to discover, or rather to obtain legal evidence against, the author, but none could be procured; the public passion swept everything before it; the patent was cancelled.

The noise of the *Drapier Letters* was followed by the anonymous publication of *Travels Into Several Remote Nations of the World*, in four parts, by Lemuel Gulliver, first a surgeon and

then a captain of several ships (Benjamin Motto, Oct. 1726), the work being well advanced, it would seem, by 1720. The keenness of the satire on courts, parties and statesmen certainly suggests that it was planned while Swift's disappointments as a public man were still rankling and recent. Although he was afraid of the reception the book would meet with, especially in political circles, the world chose to be diverted by it. In the first two parts the misanthropy is quite overpowered by the fun. The third part, equally masterly in composition, is less felicitous in invention; and in the fourth Swift has indeed carried out his design of vexing the world at his own cost.

Swift's grave humour and power of enforcing momentous truth by ludicrous exaggeration were next displayed in his *Modest Proposal for Preventing the Children of Poor People from being a Burden to their Parents or the Country,* by fattening and eating them (1729). The *Directions to Servants,* a satire on domestics, was first published in 1745, while *Polite Conversation,* written in 1731 was published in 1738. Little beyond occasional verses—trivial and often indecent—followed, but the delightful *Hamilton's Bawn,* and the verses on his own death (1731) are exceptions, and in *The Legion Club* of 1736 he composed the fiercest of all his verse satires. His popularity remained as great as ever (he received the freedom of Dublin in 1729), and he governed his cathedral with great strictness and conscientiousness; but the attacks of giddiness to which he had always been subject increased upon him, and he grew more and more capricious and morbidly suspicious. In March 1742 it was necessary to appoint guardians of Swift's person and estate. In September of the same year his physical malady reached a crisis, from which he emerged a helpless wreck, with faculties paralysed rather than destroyed, and he eventually sank into the dementia which preceded his death on Oct. 19, 1745. He was interred in his cathedral at midnight in the same coffin as Stella, with an epitaph written by himself.

An object of pity as well as of awe, Swift is one of the most tragic figures of English literature. His master passion was imperious pride—lust for despotic dominion; place, profit and literary fame were comparatively indifferent to him. Contemptuous of the opinion of his fellows, he hid his virtues, paraded his faults, affected some failings from which he was really exempt, and, since his munificent charity could not be concealed from the recipients, laboured to spoil it by gratuitous surliness. "To think of him," says Thackeray, "is like thinking of the ruin of a great empire." Among those influenced by Swift may be mentioned Chesterfield, Smollett, Cobbett, Hazlitt, Scott, Borrow, Newman, Belloc.

Bibliography.—The contemporary lives of Swift, most of which contain a certain amount of apocrypha, are those of Lord Orrery (1751); Dr. Delany's *Observations on Orrery* (1754); Dean Swift's *Essay upon the Life of Swift* (1755); and Thomas Sheridan's *Life* (of 1785). Dr. Hawkesworth, in the life prefixed to his edition of the *Works* in 1755, adds little of importance. Dr. Johnson's *Life* is marred by manifest prejudice. Dr. Barrett produced an *Essay upon the Early Life* of some value (in 1808). Six years later came the useful biography of Sir Walter Scott, and (in 1819) appeared the elaborate *Life* by W. Monck Mason in the form of an appendix to his ponderous *History of St. Patrick's.* A new epoch of investigation was inaugurated by John Forster, who began a new scrutiny of the accumulated material and published his first volume in 1875. Invaluable in many respects, it exhibited the process as well as the result of biography, and never got beyond 1711. The *Life* by Sir Henry Craik (1882 and reissues) now holds the field. Valuable monographs have been produced by Sir Leslie Stephen (Men of Letters and the Memoirs, in the *Dict. Nat. Biog.*), by Thackeray, in his *English Humourists,* by W. R. Wilde, in his *Closing Years of Dean Swift's Life,* by Lecky, in his *Leaders of Public Opinion,* by G. P. Moriarty, J. Churton Collins (1893), Max Simon (1893), Henriette Cordelet (1907) and Sophie Shilleto Smith (1910). The anecdotes of Swift related in Spence, *Laetitia Pilkington,* Wilson's *Swiftiana,* Delany's *Autobiography,* etc., though often amusing, can hardly be accepted as authentic.

The collective editions of Dr. Hawkesworth (various issues, 1755–79), T. Sheridan (1785), John Nichols (1801, 1804, 1808), Scott (1814 and 1821) and Roscoe (2 vols., 1849) have been in most respects superseded by the edition in Bohn's Standard Library in 14 volumes (including the two subsequently issued volumes of *Poems*) (1897–1910); arranged as follows: I. Biog. Introduction by W. E. H. Lecky; *Tale of a Tub; Battle of the Books; Critical Essay upon the Faculties of the Mind; The Bickerstaff Pamphlets,* etc., ed. Temple Scott. II. *Journal to Stella,* ed. F. Ryland (two portraits of Stella). III. and IV. *Writings on Religion and the Church,* ed. Temple Scott. V. *Historical and Political Tracts—English,* ed. Temple Scott. VI. *Historical and Political Tracts—Irish,* ed. Temple Scott. VII. The *Drapier's Letters,* ed. Temple Scott. VIII. and XI. Literary Essays, including *Gulliver's Travels* (ed. G. R. Dennis); *A Proposal for Correcting, Improving and Ascertaining the English Tongue; Hints towards an Essay on Conversation; Character; Directions to Servants;* and *Autobiographical Fragment,* ed. Temple Scott. IX. Contributions to the *Examiner, Tatler, Spectator,* etc., ed. Temple Scott. X. Historical Writings, including the *Four Last Years; Abstract of English History;* and *Remarks on Burnet,* ed. Temple Scott. XII. Essays on the Portraits, etc., Bibliography by W. Spencer Jackson, and Index. Twelve portraits of Swift are included in the work, in addition to two portraits of Stella and one of Vanessa. XIII. and XIV. Poems, ed. W. Ernst Browning.

Translations and editions of *Gulliver's Travels* have been numerous. "Valuable Notes for a Bibliography of Swift" were published by Dr. S. Lane Poole in *The Bibliographer* (Nov. 1884). (R. G.; X.)

SWIFT, a bird so called from the speed of its flight. Despite its appearance, the swift (*Apus apus*) is in no way related to the swallow and is not even a Passerine bird, its affinities being with the humming birds. The common swift is a summer visitor to Europe, arriving in May and returning to Africa at the end of August. It nests in holes in buildings, less frequently in cliffs and quarries. On the wing it gives the idea of a bow and arrow; it is a larger bird than the swallow and its flight is swifter and steadier. Except for a greyish-white patch under the chin, the plumage is entirely sooty black. Near sunset the birds often sweep round in screaming bands, and sometimes then ascend out of sight. It has been stated that they may spend the night on the wing at great heights; further observation on this point is needed, as also on the assertion that swifts actually pair in mid-air. A larger species, *A. melba,* with white under parts, inhabits the mountains and cliffs of southern Europe and is very numerous in the old water tower at Lucerne.

CHIMNEY SWIFTS (CHAETURA PELAGICA), SHOWN WITH NESTS AND EGGS

The allied genus *Collocalia* construct nests of saliva and these are used by the Chinese for soup. The birds breed in caves, and range from north Madagascar to the Marquesas, one species occurring in the hill country of India. The chimney swallow of the United States (*Chaetura pelagica*) is also a swift, cementing its nest with saliva. It is migratory.

SWIFT AND COMPANY. The packing business which became Swift and Company in 1885 was founded in 1868 by Gustavus F. Swift. Swift began his business career as a Cape Cod meat retailer and live-stock dealer, but in 1875 moved to Chicago and entered the packing business. Almost immediately he began to make experimental refrigerator-car shipments of dressed beef to New England. Because of his part in making the western dressed beef trade a year-round commercial success, he is regarded as one of the true pioneers of the modern packing industry.

The rapid growth of the Swift business brought about the incorporation of Swift and Company in 1885 with a capital of $300,000. By the time of Swift's death in 1903, the company had become one of the two largest packing concerns in the United States. The business has continued to grow steadily. In 1928 its sales amounted to more than $970,000,000. In 1928 the company was capitalized at $150,000,000 and was owned by more than 47,000 shareholders, of whom 13,000 were employees. The employees numbered about 55,000.

Swift and Company slaughters live stock and sells meat and by-products. It also prepares and merchandizes butter, eggs, poultry, cheese, gelatin, vegetable shortening, soap, glue, animal feeds and fertilizer. The company operates 38 slaughtering and

meat-packing plants; more than 70 poultry, butter and egg plants; 7 cotton oil mills; 21 shortening refineries; 2 soap factories; and 17 fertilizer plants. To distribute its products, Swift and Company maintains over 6,000 refrigerator-cars, which supply nearly 500 branch-selling houses, which in turn sell to retailers. Direct refrigerator-car shipments also serve retailers in more than 7,000 of the smaller American towns and villages. Over 100 foreign sales agencies are maintained abroad (L F Sw.)

SWIMMING, the action of self-support and self-propulsion on or in water, though used by analogy of inanimate objects, the term is generally connected with animal progression and specially with the art of self-propulsion in water as practised by man. Natation (the synonym derived from Lat *natare*) is one of the most useful of the physical acquirements of man There have been cases in which beginners have demonstrated some ability in the art upon their first immersion in deep water, but generally speaking it is an art which has to be acquired. For many years Great Britain held the supremacy in this particular form of athletics, but continental, Australian and American swimmers have so much improved and have developed such speedy strokes, that the claim can no longer be maintained.

The teaching of swimming has been taken up in schools, and where the work is well done it is customary to use a form of

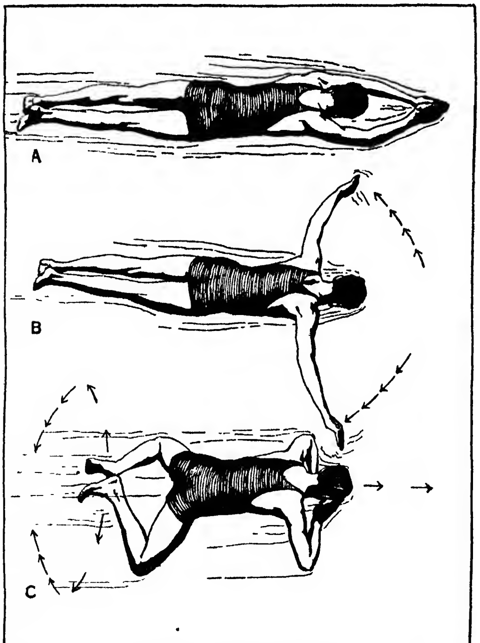

FIG 1—THE BREAST STROKE

A. Position at start and finish of stroke. B. First arm movement. C. Second movement of drawing up legs and bringing hands under chin. Arrows indicate continuation of stroke

land drill so as to impress upon the pupils some idea of the motions which have to be made in order to progress through the water This drill is the preliminary practice to the teaching of the *breast stroke.*

The Breast Stroke.—When learning the *breast stroke,* the first thing to avoid is undue haste and rapidity in the movements. It is this fault, probably born of nervousness, which causes many to aver that though eager to do so, they have never been able to learn to swim. Rapid action of the arms only exhausts the learner, whose breathing then becomes hurried and irregular, and as a consequence he fails to preserve the buoyancy necessary for carrying him along the surface. When starting for the first stroke, the beginner should draw the elbows nearly to the side, at the same time bringing up the forearm and hands to the front of the chest with the palms of the hands downwards near to the surface of the water, the fingers being extended and closed and the forefingers and thumbs nearly touching. The hands are then

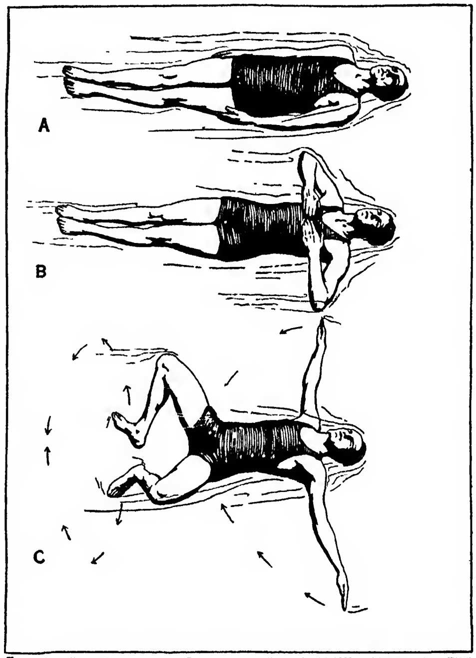

FIG. 2.—THE BACK STROKE, ONE OF THE EASIEST FORMS FOR THE BEGINNER

A. Start and finish position. B. First arm movement. C. Arm pull combined with "frog" kick

pushed forward in front of the body to the full extent of the arms, the palms of the hands are turned slightly outward, and the arms swept round until in a right angle with the shoulders, when the elbows are dropped and the hands come up in front of the chest for the next stroke. The arms should not be kept rigid, but allowed to work gracefully. As the arms are swept backward the legs are drawn up, the knees being turned outward to the right and left and the heels nearly touching. The legs are then kicked outward and swept round as the arms are being pushed forward to their fullest extent, a "flip" being given with each of the feet which must be kept loose at the ankles and in the same position as when standing.

The Back Stroke.—A knowledge of the *back stroke* can easily be acquired by those who are able to swim on the breast, for the leg action is very similar and the principles relating to the use of the arms are almost the same. The arms, instead of being moved through the water, are lifted in the air and carried out to beyond the head with the palms upwards. The palms are then slightly turned and the arms swept round. Just as this action is being made the legs are drawn up as in the breast stroke, the body being allowed to travel on with the force of the kick as the arms are extended beyond the head. The great difficulty that a back swimmer has to contend with in open water is that of steering, and the best way to overcome it is to take an object for a guide before starting and hold the head slightly to the side so as to steer by it. An adaptation of the *crawl stroke** is now used by most

back swimmers in short distance races.

At one time the *side stroke* was the great racing stroke; the body being placed on the side, the upper arm worked from the head to the upper side of the body, the lower arm taken downwards through the water to the underside of the body and a

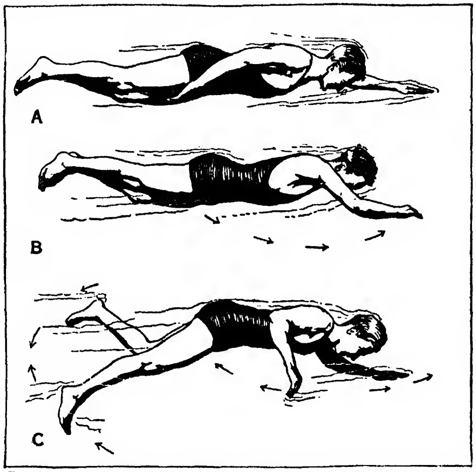

FIG. 3.—SIDE STROKE, THE BASIC STROKE FOR ADVANCED METHODS OF SWIMMING
A. Position at start and finish of stroke. B. Arm reach. C. Combination of arm pull and scissors kick

scissor-like kick made with the legs; but this has now been generally given up in favour of the *over-arm, trudgen* and *crawl strokes.*

The Over-arm Stroke.—In the *over-arm* stroke the body is usually turned on the right side. At the start the lower arm is pulled downwards towards the hips, the fingers being kept closed and the hand flat, so as to present a large surface to the water. When the stroke is finished the hand is turned quickly palm upwards, so that together with the lower part of the arm it cuts the water sideways, the arm being almost bent double. Then, as it is shot forward, the hand is gradually turned from palm upwards to palm downwards, until, when it arrives at its position beyond the head, it is ready for the next stroke. The recovery and the pull ought to be effected as quickly as possible. The upper arm stroke is started when the downward stroke of the under or right arm is finished. It is started in front of the forehead, the arm being slightly bent and the fingers pointing downwards. The hand is pulled past the face and chest with the arm bent at right-angles and swept back in front of the body, the arm gradually straightening as it leaves the water opposite the hip. When the hand is opposite the hip it should be brought quickly out of the water and sent forward for the next stroke. When the upper arm is opposite the shoulder in its pull through the water the legs are kicked wide apart and closed again at the moment when the hand leaves the water. The kick is completed and the legs straightened before the left hand is replaced ready for the next stroke. As the legs are opened the upper leg is kicked forward with the knee slightly bent, and the foot kept in its ordinary position. The lower leg is bent double until the heel approaches the thigh, which is brought backwards slightly. In the actual kick the upper leg is sent forward, and as it is straightened vigorously the under leg from the knee downwards comes forward to meet it with a vicious kick; the swirl of the feet and closing of the legs drives the body forward. This is what has come to be known in Great Britain as the "Northern Kick" by reason of its first being introduced by Lancashire swimmers.

The Trudgen Stroke.—This stroke, more commonly known as the trudgeon stroke, and on the continent of Europe as Spanish swimming, was first made prominent in England in 1873, by a swimmer named J. Trudgen, who stated that he had acquired the knowledge of it while in South America. It was, however, known to Clias, a writer on swimming, who described it in 1825 as "The Thrust." Trudgen's speed was so great for his time that swimmers quickly copied his style, and it is from this stroke that the crawl stroke has been developed. When swimming Trudgen kept on the chest and lifted the upper part of his body at each stroke out of the water and at each swing of the arms pulled himself forward, a considerable swirl of the water occurring as each movement was finished. The arms were brought forward sideways, each completing a circle on each side of the body, and the head kept completely above water. Those who copied Trudgen soon found it was less laborious and equally as fast to use a double over-arm stroke with the head and chest well down, and thus have the body supported by the water, using the ordinary over-arm leg kick.

The Crawl Stroke.—Like the trudgen, this is an adaptation from native swimmers. It was not generally known in Great Britain until 1902, when Richard Cavill came from Australia to compete in the English championships, but it is said to be common with the natives of the South Sea islands, and from there introduced into Australia about the year 1900. From thence it came to Europe and there C. M. Daniels, the American amateur champion of that period, made so excellent a study of it that in 1907 he not only so greatly increased his own pace as to be able to win the English championship, and beat the world's record for a hundred yards, but also introduced various improvements upon it. This stroke is distinct from any other form of swimming; the legs are kept straight, but not rigid. They whip the water backwards and forwards alternately, thus imitating the movements when walking on tiptoe. The power is obtained from the hips, knees and ankles. The width of the kick is about twelve inches between the heels. The speed of the kick is usually adjusted to the requirements of the individual. A supple swimmer is able to use a faster movement compared with one whose limbs are slow in action. It has been stated that some use as many as ten kicks to each complete stroke of the two arms, but it seems that the great majority find four kicks sufficiently trying. This striking or kicking is done from an upward to a downward direction, one leg at a time. The arms are used somewhat as in the trudgen stroke, they are bent at the elbows, dipped in alternately beyond the head and drawn smartly backwards until they come out of the water at the hips. The result of this movement is that when one arm is pulling or propelling the body through the water at the same moment, the other is being recov-

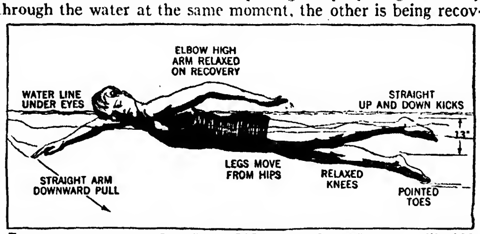

FIG. 4.—THE CRAWL STROKE, INTRODUCED INTERNATIONALLY IN 1908

ered through the air for the next stroke, thus avoiding resistance in the line of progress.

Floating.—One of the most useful accomplishments for a swimmer is that of *floating,* but curiously enough there are some who cannot acquire a knowledge of it. It is purely a matter of buoyancy, and requires constant practice before one can become perfect in it. In learning to float the beginner experiences great difficulty in overcoming the tendency of the legs to sink, and if after frequent trials they are still found to sink, he should get someone to hold them up or else place them on the steps or behind the rail of the bath, and thus assisted learn to balance the body on the surface. Before doing so he should completely fill his lungs, spread his legs wide, and then lie backwards with the arms extended in a line with the body and beyond the head, with

the palms upwards, care being taken to throw as much weight beyond the head as possible. Furthermore he must lie perfectly still and take care not to hollow the back or raise the abdomen above water. One may sink for an instant, but if the breath be held the lips will come above the surface when easy breathing may be indulged in. Only the face, chest and toes should appear above the surface of the water. A knowledge of floating is of good service to those attempting to save life.

Diving.—The usual method of entering the water is by what is known as *diving;* some think it should be termed "springing." The best method of learning to dive is to stand on the side of the bath and then stoop down until the body is nearly double, stretch out the arms in front of the head, sink the head between them and gradually fall over into the water. The ability to enter the water head first will then soon be acquired. The English header, or plain dive, and the swallow dive rank equally in competition, but at the last Olympic Games only the swallow dive was permitted. In most respects the primary points to be observed are the same in each form of diving. To the ordinary reader the word "diving," means a great deal and covers a multitude of movements. One who jumps from a bridge is said to be a diver; whether he touches the water head or feet first the action is referred to as a "dive." Diving is almost indispensable to the swimmer.

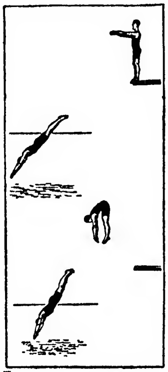

FIG. 5—(ABOVE) ENGLISH PLAIN "HEADER" SHOWING STANCE AND ANGLE OF DIVE; (BELOW) PIKE DIVE, OR AMERICAN "JACK KNIFE"

The Swallow Dive.—This dive was first introduced into Great Britain from Sweden and has now become most popular. The take-off is taken with a strong outward and slightly upward spring, simultaneously swinging the arms upwards and outwards, extending them sideways nearly level with the shoulders, the back hollowed and the head held back; legs perfectly straight, toes pointed and legs pressed close together. The arms are brought together beyond the head as for a plain dive just before the body enters the water The standard heights adopted by the International Amateur Swimming Federation are as follows:—

For spring boards—

1 metre (3ft. 3in) and 3 metres (9ft 9in.).

For firm boards—

3 to 5 metres (9ft 9in to 16ft 3in).
5 to 8 metres (16ft 3in to 26ft 0in)
8 to 12 metres (26ft 0in to 39ft 0in).

In actual practice a greater height than 10 metres (32ft 6in) is seldom used To determine the relation of height of board to depth of water the following broad principle is adopted —The height of a board should not exceed twice the depth of water, with a minimum depth of 6ft. A greater depth than 15ft. is unnecessary for any height of board.

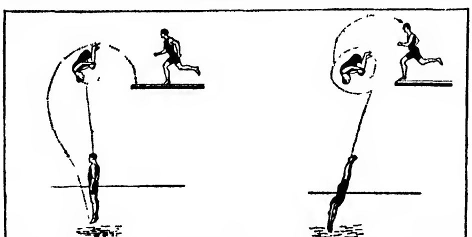

FIG 6—(LEFT) SINGLE SOMERSAULT DIVE, (RIGHT) ONE-AND-A-HALF SOMERSAULT DIVE

As standard heights have been fixed it is hoped that the Amateur Diving Association, which is the chief promoting body of diving in England, will insist upon standard spring and firm boards being used particularly in connection with the Olympic Games and other international competitions and also object to competitors using their own boards, as this gives them an unfair advantage over those who have not had the chance to practise from them. All fancy diving is based on varieties and combinations of somersaults, either single, one-and-a-half or double, pike dives, screw or twist dives. The Amateur Diving Association in its year book provides a list of 112 dives from spring and firm boards, which are valued according to difficulty of execution for the purpose of judging, which forms a good guide to the novice who desires by practice to become perfect as a diver (*See* figs 5, 6, 7, 8)

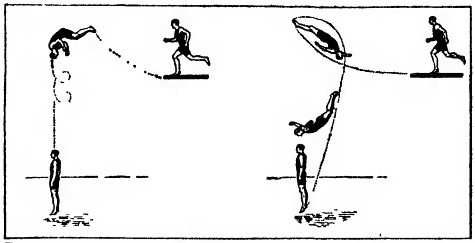

FIG. 7—(LEFT) DOUBLE SOMERSAULT DIVE, (RIGHT) MOLBERG DIVE

A useful accomplishment is that known as surface diving, because it enables the swimmer to find and bring an object to the surface. The correct method of performing it is first to swim a few yards on the surface with the breast stroke, take a breath, then suddenly depress the head, look downwards, elevate the body at the hips, and at the same time make a powerful stroke with the legs and an upward stroke with the hands The impetus thus obtained will suffice to take the swimmer to the bottom in 6ft of water Once under the surface it is only necessary to keep the head depressed and swim by means of the breast stroke in order to find the object of search When about to rise to the surface, the head should be turned backwards with the eyes upwards, and a stroke made with arms and legs.

Plunging.—The sport is not very generally practised, though there is a championship for it A plunge is a standing dive made head first from a firm take-off, free from spring. The body must be kept motionless, face downwards, no progressive movement must be imparted other than the action of the dive. The plunge terminates when the plunger raises his face above the surface of the water With the idea of preventing long tests without breathing, it was deemed, in 1893, advisable by the Swimming Association to impose a time limit of one minute in all competitions Yet even with this time limit the record plunge stands at 85ft 6ins for men and 71ft for women

Open-air and Indoor Swimming.—Most of the principal races are decided in baths, but there has been a tendency to revert to open water in the summer and also to encourage long-distance swimming. The first public baths in Great Britain were opened by the corporation of Liverpool in 1828 and the Baths and Washhouses Act was passed in 1846, the first of the London parishes to adopt the act being St. Martin's in the Fields, which opened baths in Green Street, Leicester Square, in 1846. Since then public baths have been erected all over Great Britain and Ireland, and bath swimming has become, by reason of the lack of reasonable open water accommodation the principal means of

teaching the young. But open water swimming, and more particularly swimming in the sea, is the best training and practice for those who really love the art, because they are able to swim under normal climatic conditions, instead of in tepid water.

When bathing in the open, care has to be taken to avoid weeds or undercurrents. In the event of accidentally getting into a bed of weeds, the swimmer should cease kicking and work with the arms, and the current will then take him through. If he tries to swim, the weeds will entangle his legs and put him in an awkward plight. If he is carried away by a current in a river, he should select a spot on either bank and swim diagonally towards it, never minding where he has left his clothes. When in the sea, the conditions are not always the same, though the general rule of swimming diagonally for shore also applies. For sea bathing, however, it is far better, no matter how good a swimmer one may be, to have a boat in attendance. Before bathing in a strange place, the swimmer should make himself acquainted with the currents and the direction of the tide. When the tide is going out the course should be made close in along the coast. In a rough sea the swimmer should not attempt to breast the waves, but as each wave rises he should swim through, thereby saving himself from buffeting, which, if long continued, would cause insensibility or else great waste of physical power. When using a boat for bathing the best way is to dive from the stern, to which some steps or a rope ladder should be fixed, in order to aid the swimmer when getting in again. Failing these being at hand, the best way is to lay hold of the stern with both hands and then, making a hard rising kick, raise the body till it rests on the edge at the hips. Then smartly slip the hands a little forward, turn to a sitting position and enter the boat.

Speed swimming records are so frequently altered that students had best obtain the Amateur Swimming Association's annual handbook, in which are detailed the accepted records up to date. The improvement in speed has been most remarkable. In 1877 the mile amateur record was 29min. $25\frac{1}{2}$sec., and that stood until 1892. The record in 1909 was 24min. $1\frac{2}{5}$sec. made by T. S. Battesby. In Jan. 1929 Arne Borg set up a world's record of 21min. $6\frac{4}{5}$sec. The hundred yards record has been similarly reduced. In 1878 it was 1min. $16\frac{3}{4}$sec.; in 1888 it had been lowered by J. Nuttall to 1min. $6\frac{1}{4}$sec.; and in 1925 J. Weismuller of America, created a world's record of 52sec., which he lowered to 51sec. in 1927. The records over intermediate distances have also been considerably lowered, and many long-distance swimming records have from time to time been created.

In 1910 F. E. Beaurepaire of Australia scored a series of remarkable victories in English championships, winning every event from 100yds. to one mile inclusive. In 1912 an Hawaiian, Duke Kahanamoku, H. Hebner of Chicago and George Hodgson of Canada, set up world's records at the Stockholm Olympiad. Apart from the prowess of the foregoing, the Stockholm fixture was noteworthy for the advent of women into Olympic swimming contests. Miss Fannie Durack of Australia won the sprint in record time, while a quartette of British ladies secured the team event. A year later, J. G. Hatfield of England came to the front, and proved supreme in all distance events.

Olympic Games.—The governing swimming associations in Great Britain ceased operations during the war, but in certain areas commendable efforts were made to keep the flag flying by intensive work. Britain's only Olympic success at the Paris Games was scored by Miss Lucy Morton, who first came into prominence in 1915. The coaching propaganda was responsible for the rise to fame of the Misses E. Mayne, C. M. Jeans, H. M. James, I. Gilbert, G. Carson, M. Hamblin, M. A. Barker, E. King, M. J. Cooper, M. Specer, D. B. Hart, M. Laverty, also Messrs. A. Rawlinson, R. Flint and W. Stoney, all of whom have either won national titles or established records.

The Olympic Games at Antwerp in 1920 supplied convincing proof of American supremacy, for the Stars and Stripes were carried to success in the free, back stroke and team events in record time, but the breast swimming fell to Scandinavian contestants. New records were established with clockwork regularity. The Hawaiian-Americans, Kahanamoku in the 100 metres (1min. $1\frac{2}{5}$sec.) Kealoah, in the back stroke 100 metres (1min. $15\frac{1}{5}$sec.) being the outstanding performers among the men, whilst Miss Bleibtrey set up new world's figures for 100 metres (1min. $13\frac{3}{5}$sec.) and 300 metres (4min. 34sec.), all of which have since been beaten. The Antwerp Olympiad was noteworthy for the advent of mere children into the Olympic Games. Nils Skoglund, a 14-year-old Swedish boy, took honours in the men's high diving event, and Miss Aileen Riggin, a 13-year-old American, earned world fame by annexing the fancy diving contest against all comers, with her youthful country-woman Miss Helen Wainwright taking second place. Swedish nominees took the high diving for men and women, but the fancy diving was secured by America's representatives. In 1923 Arne Borg made a world tour when he met the Australian champion Andrew Charlton, the latter proving successful in three contests, when new records were tabulated. John Weismuller, a well set-up youth of Austrian descent, created world's figures for every distance from 50yd. up to and including 220yd.; he also proved equally skilful when swimming on the back. Weismuller won the 100 and 400 metres events at the Olympic Games at Paris in 1924, his respective times being 59sec., and 5min. $4\frac{1}{5}$sec. In the 400 metres Weismuller was forced to his utmost to defeat Arne Borg and Charlton, as only $2\frac{2}{5}$sec. separated the first three. Charlton, however, won the 1,500 metres in 20min. $6\frac{2}{5}$sec. breaking the Olympic and world's record of 22min. created by the Canadian, George Hodgson, at Stockholm in 1912. Although the Americans almost swept the board at Paris, it was noticeable that other countries including Sweden, Australia, England and Japan were rapidly closing up to them. Takaishi, a tiny Japanese, returned 1min. $1\frac{2}{5}$sec. in the 100 metres and in the 1,500 metres semi-final he returned 21min. $58\frac{3}{5}$sec.

In the 1928 Olympiad Weismuller again won the 100 metres, in 1sec. faster time than in 1924, but the American successes were not so sweeping as at Paris, Argentina, Germany, Holland, Japan and Sweden winning events.

Channel Swimming.—Much interest has centred in the many attempts to swim across the English channel; the first recorded attempt was made on Aug. 24, 1872, by J. B. Johnson, who started from Dover, but remained in the water only 65 minutes. It was on Aug. 12, 1875, that Capt. Matthew Webb made his first attempt. He started from Dover and remained in the water 6hr. 49min., when the weather became too rough for him to continue. It is estimated that he was about $13\frac{1}{2}$ miles across when he had to give up. On Aug. 24 and 25, 1875, he swam across the English channel, diving from the Admiralty pier, Dover, and touching Calais sands, after swimming for 21hr. 45m., and at the time this accomplishment created a great sensation in England. Since then fifteen other successful attempts have been made and they are as follows:—Sept. 6, 1911, T. W. Burgess, 21hr. 35min.; Aug. 6, 1923, H. Sullivan, 20hr. 50min.; Aug. 12, 1923, S. Tirabosche, 16hr. 35min.; Sept. 9, 1923, C. Toth, 16hr. 54min.; Aug. 6, 1926, Miss G. Ederle, 14hr. 31min.; Aug. 28, 1926, Mrs. Corson, 15hr. 28min.; Aug. 30, 1926, H. Vierkotter, 12hr. 40min.; Sept. 10, 1926, G. Michel, 11hr. 5min.; Sept. 17, 1926, N. L. Derham, 13hr. 56min.; Aug. 5, 1927, E. H. Temme, 14hr. 29min.; Oct. 7, 1927, Miss M. Gleitze, 15hr. 15min.; Oct. 13, 1927, Mrs. Ivy Gill, 15hr. 9min.; Aug. 19, 1928, Miss Ivy Hawke, 19hr. 16min.; Aug. 24, 1928, Miss Hilda Sharp, 14hr. 58min.; Sept. 1, 1928, Helmy, 23hr. 40min. Messrs. Webb, Burgess and Sullivan swam from England to France and all the others from France to England; these results have created an interest in long-distance swimming in all parts of the world that has resulted in the accomplishment of trials and tests once thought impossible.

BIBLIOGRAPHY.—The literature on the subject of swimming is considerable; the most useful work of general reference is Ralph Thomas's *Swimming* (1904), which contains a bibliography from the earliest time. Other chief works on the technique of swimming that may be mentioned are: Thevenot, *The Art of Swimming* (1789); Steedman, *Manual of Swimming* (Melbourne, 1867); W. Wilson, *The Swimming Instructor* (1883); A. Sinclair and W. Henry, *Swimming* (Badminton Library, 1893); C. M. Daniels, *How to Swim and Save Life* (Spalding's Library, 1907); H. R. Austin, *How to Swim* (1914); L. de B. Handley, *Swimming and Watermanship* (New York, 1918); *Handbook of the Amateur Swimming Association*, containing list of

records, published annually; *Handbook of the Amateur Diving Association,* published annually. (X.)

THE UNITED STATES

Standardized water sports for men were launched in 1878, upon the formation of the Amateur Athletic Union of the United States, but not until 1917 did the organization undertake to supervise and regulate water sports for women. Universities began to promote competitive swimming shortly after 1880 and schools soon followed By 1928 there were collegiate and scholastic associations fostering aquatics in all sections of the country and no less than 20,000 schoolboys took part in water carnivals conducted by a single organization, the Public School Athletic League of New York. Charles M Daniels was the first American amateur swimmer to attain international rating He shattered the world's open water record for 220 yd. free style in 1904 and subsequently reaped signal honours at home and abroad, bettering other records and winning the Olympic 100 metre championship at Athens in 1906 and again at London in 1908

The great leap forward in speed swimming, however, followed the introduction of the crawl stroke, first used in standardized racing by Richard Cavill of Australia. The earliest knowledge of the crawl obtained by Americans was gleaned from hazy newspaper descriptions of Cavill's stroke. In attempting to imitate the action they unwittingly developed a faster leg drive, executing four scissoring kicks per stroke, instead of the two performed by Cavill. The new leg drive was combined by Americans with the double over-arm action of the trudgeon, and the resulting stroke christened four-beat crawl, to distinguish it from the two-beat Australian variety

Meanwhile, experiments had led to the belief that the four-beat leg thrash was most effective when composed of one comparatively wide and three very narrow scissoring motions. This style, termed four-beat trudgeon-crawl, or four-beat single-rhythm crawl, became the accepted racing medium. The combination of movements was responsible for so notable an improvement in average performances that technical experts conceived the possibility of obtaining still greater speed from a six-beat drive set to a double rhythm—two major and four minor kicks—which would minimize resistance and afford more even distribution of propelling power. But coaches were unanimous in declaring that the swift thrash would prove entirely too laborious for distances longer than about 100 yd, and the subject was dropped temporarily.

Late in 1917, however, two young champions of the Women's Swimming Association of New York, Miss Charlotte Boyle and Miss Claire Galligan, determined to give the six-beat crawl a trial and by the summer of 1918 they broke records with it over the longer regulation courses, 880 yd. and one mile. So convincing was this demonstration that it caused a sudden change of mind among coaches and competitors The six-beat crawl immediately won favour in the United States, presently in other countries and within a few years it had become the recognized stroke the world over, not only for racing, but for all around purposes The coaching staff of the New York association later evolved a crawl system of elementary instruction which greatly simplified the task of teaching swimming to beginners. Then another of its champions, Miss Ethel McGary, successfully exploited in turn the eight and ten-beat varieties of crawl, achieving title and record honours.

The most impressive illustration of the progress made in the United States through the advent and development of the crawl is afforded by the old and new national records for the classic competitive fixtures, 100 yd. in 75 ft. pools and 1 m. over courses of 55 yd. and upward. Before the introduction of the crawl the men's respective records were listed at $58\frac{3}{5}$ sec. and 28 min. $14\frac{3}{5}$ sec., the women's unofficially quoted at 1 min. 22 sec and 35 min. $38\frac{2}{5}$ seconds. By 1928 the men's standards had been slashed to 51 sec and 21 min. $35\frac{3}{5}$ sec, the women's to 1 min. $\frac{9}{10}$ sec. and 24 min $49\frac{3}{5}$ seconds. It must be ascribed chiefly to the crawl, too, that American swimmers of both sexes, from trailing far behind rivals from other countries, rose to undisputed international leadership At the Olympiad of 1912 in Stockholm, before the stroke had been perfected and generally adopted, the United States was fifth in the natatorial competition, outpointed by Germany, Sweden, England and Australia in this order. At Antwerp in 1920, on the other hand, American men and women, the latter taking part in their first Olympiad, decisively outscored all opposing teams. This they repeated at Paris in 1924, and Amsterdam in 1928.

Daniels, America's first international swimmer, garnered his early laurels with the trudgeon, but he did not attain nearly his best speed until he became a devotee of the crawl. Miss Gertrude Ederle, who swam the English channel in 1926, the first woman to accomplish the feat, used the crawl and covered the course in 14 hr. 34 min., faster time than ever returned by any man up to then. Among the outstanding figures in the history of American swimming besides the men and women named, are Henry Sullivan, Charles Toth and Mrs. Mille Gade Corson, also channel conquerors; Harry Hebner, Olympic champion and first to use the crawl back stroke; Duke Kahanamoku of Honolulu, Perry McGillivray, Norman Ross, John Weissmuller, Walter Spence, Walter Laufer, George Kojac and the Misses Ethelda Bleibtrey, Sybil Bauer, Aileen Riggin, Helen Wainwright, Ethel Lackie, Agnes Geraghty, Albina Osipowich, Josephine McKim, and Martha Norelius, all swimmers of international rank and prolific record-breakers in their day. (L. DE B H.)

SWINBURNE, ALGERNON CHARLES (1837–1909), English poet and critic, was born in London on April 5, 1837 He was the son of Admiral Charles Henry Swinburne (of an old Northumbrian family) and of Lady Jane Henrietta, a daughter of George, 3rd earl of Ashburnham. His childhood was spent on the Northumberland estate of his grandfather, Sir John Edward Swinburne, Bart, and at his father's place, East Dene, in the Isle of Wight. Of the two, the influences of the island are, perhaps naturally, the stronger in his poetry, and many of his most beautiful pieces were actually written at the Orchard, an exquisite spot by Niton Bay, where he was a constant visitor

After five years at Eton, Swinburne went to Balliol college, Oxford, in 1857 Jowett was his firm friend after he left Oxford, and Swinburne visited him repeatedly at the seaside and in the country He left Oxford in 1860, and in the same year published the two dramas, *The Queen Mother* and *Rosamond,* a wonderful performance for so young a poet, fuller of dramatic energy than most of his later plays, and rich in harmonies of blank verse.

After spending some time with the Bell Scotts at Newcastle, Swinburne came to London, and began the intimate friendship with D. G. Rossetti which was to last for the next ten years In 1861 he was introduced to Monckton Milnes (Lord Houghton, *q v*), who took an interest in his work and invited him to Fryston There Swinburne created an unforgettable impression in the brilliant circle which gathered there, by his wide and varied acquaintance with ancient and modern literature and his astonishing memory. In 1862 he met Meredith, and a review of one of Victor Hugo's books resulted in correspondence In the autumn of that year he lived with Meredith and the Rossettis at 16 Cheyne Walk. Swinburne showed symptoms of something approaching epilepsy, and it was thought better that he should be with friends. In 1864 he made a tour in France and Italy. At Florence he met Mrs. Gaskell and Landor. For Landor he had a great admiration, but their meetings were few and short On his return to London he took lodgings in Dorset Street, where he made his home for many years.

In 1865 appeared the lyrical tragedy of *Atalanta in Calydon,* followed by *Chastelard,* and the famous *Poems and Ballads* in 1866. The *Poems and Ballads* were vehemently attacked, but *Dolores* and *Faustine* were on everyone's lips: as a poet of the time has said, "We all went about chanting to one another these new, astonishing melodies." By the close of his 30th year, in spite of hostility and detraction, Swinburne had placed himself in the highest rank of contemporary poets, and had even established himself as leader of a choir of singers to whom he was at once master and prophet.

Meanwhile, his life was disturbed by domestic sorrow. A favourite sister died at East Dene, and was buried in the churchyard of Bonchurch. Her loss overwhelmed Admiral Swinburne with grief, and he could no longer tolerate the house that was so

full of tender memories. So the family moved to Holmwood, in the Thames Valley, near Reading. Swinburne entered on a course of gaiety in London which seriously affected his health and alarmed his friends. At the same time he saw much of the Pre-Raphaelite movement, and for the next few years he was involved in a rush of fresh emotions and rapidly changing loyalties.

Works.—It is indeed necessary to any appreciation of Swinburne's genius that one should understand that his inspiration was almost invariably derivative. His first book is deliberately Shakespearian in design and expression; the *Atalanta,* of course, is equally deliberate in its pursuit of the Hellenic spirit. Then, with a wider swing of the pendulum, he recedes, in *Poems and Ballads,* to the example of Baudelaire and of the Pre-Raphaelites themselves; with the *Song of Italy* (1867) he is drawing towards the revolt of Mazzini (whom he had met at the house of George Howard, afterwards earl of Carlisle); by the time *Songs before Sunrise* are completed (in 1871) he is altogether under the influence of Victor Hugo, while Rome has become to him "first name of the world's names." But, if Swinburne's inspiration was derivative, his manner was in no sense imitative; he brought to poetry a spirit entirely his own, and a method even more individual than his spirit. It is well to distinguish clearly between the influences which touched him and the original, personal fashion in which he assumed those influences, and made them his own. The spirit of Swinburne's muse was always a spirit of revolution. In *Poems and Ballads* the revolt is against moral conventions and restraints; in *Songs before Sunrise* the arena of the contest is no longer only the sensual sphere, but the political and the ecclesiastical. The detestation of kings and priests, which marked so much of the work of his maturity, is now in full swing, and Swinburne's language is sometimes tinged with extravagance and an almost virulent animosity.

With *Bothwell* (1874) he returned to drama and the story of Mary Stuart. The play has fine scenes and is burning with poetry, but its length transcends all possibilities of harmonious unity. *Erechtheus* (1876) was a return to the Greek inspiration of *Atalanta;* and then in the second series of *Poems and Ballads* (1878) the French influence is seen to be at work, and Victor Hugo begins to hold alone the place possessed, at different times, by Baudelaire and Mazzini. At this time Swinburne's energy was at fever height; in 1879 he published his eloquent *Study of Shakespeare* and *Poems and Ballads* (second series) and in 1880 no fewer than three volumes, *The Modern Heptalogia,* a brilliant anonymous essay in parody, *Songs of the Springtides,* and *Studies in Song.* It was shortly after this date that Swinburne's friendship for Theodore Watts-Dunton (then Theodore Watts) grew into one of brotherly intimacy. After 1880 Swinburne's life remained without disturbing event, devoted entirely to the pursuit of literature in peace and leisure.

The conclusion of the Elizabethan trilogy, *Mary Stuart,* was published in 1881, and in the following year *Tristram of Lyonesse,* a wonderfully individual contribution to the modern treatment of the Arthurian legend, in which the heroic couplet is made to assume opulent, romantic cadences of which it had hitherto seemed incapable. Among the publications of the next few years must be mentioned *A Century of Roundells,* 1883; *A Midsummer Holiday,* 1884; and *Miscellanies,* 1886. The current of his poetry, indeed, continued unchecked; and though it would be vain to pretend that he added greatly either to the range of his subjects or to the fecundity of his versification, it is at least true that his melody was unbroken, and his resplendent torrent of words inexhaustible. His *Marino Faliero* (1885) and *Locrine* (1887) have passages of power and intensity unsurpassed in any of his earlier work, and the rich metrical effects of *Astrophel* (1894) and *The Tale of Balin* (1896) are inferior in music and range to none but his own masterpieces. In 1899 appeared his *Rosamund, Queen of the Lombards;* in 1908 his *Duke of Gandia;* and in 1904 was begun the publication of a collected edition of his poems and dramas in 11 volumes.

Later Years.—Meanwhile, in the autumn of 1879 the state of his health seriously alarmed his friends, and, with the consent of Lady Jane Swinburne, Watts-Dunton took him to live at his house, The Pines, Putney, where the last 30 years of his life were spent in complete retirement. He very rarely made the short journey into London, although his health was gradually restored. The friends visited Paris in 1882. In 1888 a flash of his old excitability involved him in a quarrel with Whistler.

Besides this wealth of poetry, Swinburne was active as a critic, and several volumes of fine impassioned prose testify to the variety and fluctuation of his literary allegiances. His *Note on Charlotte Brontë* (1877) must be read by every student of its subject; the *Study of Shakespeare* (1880)—followed in 1909 by *The Age of Shakespeare*—is full of vigorous and arresting thought, and many of his scattered essays are rich in suggestion and appreciation. His studies of Elizabethan literature are, indeed, full of "the noble tribute of praise," and no contemporary critic did so much to revive an interest in that wonderful period of dramatic recrudescence, the side-issues of which have been generally somewhat obscured by the pervading and dominating genius of Shakespeare. His prose work also includes an early novel in the form of letters, *Love's Cross-currents,* which had appeared serially in the Tatler and was revised for publication in 1905.

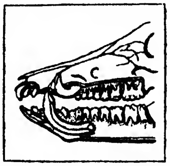
Place in Literature.—The service which Swinburne rendered to the English language as a vehicle for lyrical effect is simply incalculable. He revolutionized the entire scheme of English prosody. Nor was his singular vogue due only to this extraordinary metrical ingenuity. The effect of his artistic personality was in itself intoxicating, even delirious. He was the poet of youth insurgent against all the restraints of conventionality and custom. The young lover of poetry, when first he encounters Swinburne's influence, is almost bound to be swept away by it; the wild, extravagant license, the apparent sincerity, the vigour and the verve, cry directly to the aspirations of youth like a clarion in the wilderness. But, while this is inevitable, it is also true that the critical lover of poetry outgrows an unquestioning allegiance to the Swinburnian mood more quickly than any other of the diverse emotions aroused by the study of the great poets. It is impossible to acquit his poetry entirely of the charge of an animalism which wars against the higher issues of the spirit—an animalism sometimes of love, sometimes of hatred, but, in both extremes, out of centre and harmony.

Yet, when everything has been said that can be said against the unaesthetic violences of the poet's excesses, his service to contemporary poetry outweighed all disadvantages. No one did more to free English literature from the shackles of formalism; no one, among his contemporaries, pursued the poetic calling with so sincere and resplendent an allegiance to the claims of absolute and unadulterated poetry. Some English poets have turned preachers; others have been seduced by the attractions of philosophy; but Swinburne always remained an artist absorbed in a lyrical ecstasy, a singer and not a seer. When the history of Victorian poetry comes to be written, it will be found that his personality was, in its due perspective, among the most potent of his time; and as an artistic influence it will be pronounced both inspiring and beneficent. On April 10, 1909 the poet died at his home, "The Pines," where he had lived many years. Swinburne's poems were published in 6 vols. in 1904, and his tragedies in 5 vols. in 1905–06. *See* also the article by Edmund Gosse, in the Dic. Nat. Biog. (2nd supplement 1901–11); H. Nicholson, *Swinburne* (English Men of Letters Series 1926); G. Lafourcade, *La Jeunesse de Swinburne* (2 vols., bibl. 1928); and S. C. Chew, *Swinburne* (1929). (E. G.; X.)

SWINDON, a market town and municipal borough in the Swindon parliamentary division of Wiltshire, England, 77¼ m. W. of London by the G.W. railway, of which it is an important junction. Pop. (1921) 54,920. It has two parts, the new and the old. The present town received its charter in 1901. The new town grew up around the vast locomotive and wagon works of the G.W. railway. It rose rapidly on a strip of waste land, and churches and chapels were built for the workmen, whose numbers soon exceeded 10,000. Each man contributes to a medical fund which maintains the fever, accident and general hospitals, providing also laundries and baths. There are a mechanics' institute, containing a large library, theatre, reading-rooms and lec-

ture-hall. The company owns a park with football and cricket grounds. The old town stands on a hill overlooking the Gloucestershire borders. The railway engine and wagon works now employ over 12,000 hands Many are engaged in the neighbouring quarries, and there are also clothing factories and corn mills.

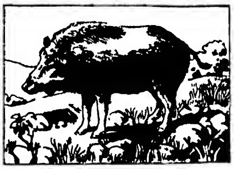
SWINE, a name applied to the domestic pig, but also used to include its wild relatives The animals constitute the family *Suidae* of the *Suina* (*See* ARTIODACTYLA) The *Suidae* are divisible into the true swine (*Suinae*) of the Old World, and the American peccaries (*q.v.*) (*Dicotylinae*). The *Suinae* are characterized by an elongated, mobile snout, with an expanded, truncated, terminal surface in which the nostrils are placed; narrow feet with four toes on each, the outer pair not reaching the ground when walking; the canines in both jaws developed into upwardly directed tusks, best developed in the male.



THE DENTITION OF THE BOAR, 12 INCISORS, 4 CANINES, 16 PREMOLARS AND 12 MOLARS, TOTAL 44

The typical genus *Sus* is exemplified by the domesticated pigs (*see* PIG) and the wild boar. (*See* BOAR) Allied to these are the pigmy hog of Nepal (*Porcula salvania*), about the size of a hare; and the African river-hogs (*q.v*) (*Potamochoerus*).

Linking these genera with the wart-hogs is the African *Hylochoerus*, a forest-dwelling form with a thick coat of coarse black hair. The remaining forms are the wart-hogs (*Phacochoerus*, *q v.*) and the babirusa (*q v.*) Extinct swine, some of gigantic size, are known from strata as far back as the Pliocene of Europe and Asia; many of these belonged to the genus *Sus*



THE WILD BOAR (SUS SCROFA)

SWINE FEVER, the name applied in Great Britain to a disease which occurs only in swine; in America, the synonym, hog cholera, is used; in Germany, *Schweinepest*.

The disease has a wide distribution throughout Europe, America and Africa, and is not uncommon in the British Isles Although in the past the cause of the disease has been ascribed to various bacilli, it has been recognized for a number of years that the condition is due to a filter-passing virus (*q v*).

The filtrates from the blood of pigs affected with swine fever are free of visible organisms and yet convey the disease when administered to healthy swine Methods of cultivating the causal virus outside the body are not known Differences of opinion have existed as to the part played by the visible bacteria in the causation of the disease, but the view is generally held that the virus of swine fever so lowers the resistance of its host that bacteria, normally non-pathogenic to healthy pigs, are capable of becoming pathogenic and so to assume the rôle of secondary invaders. The bacillus suipestifer is one of the most important of these and has been shown to be present in the intestines of healthy pigs Morphologically it occurs as a short, motile rod, and biologically it is related to the paratyphoid group; it stains readily with the basic aniline dyes and is easily culturable

Natural infection results from immediate or mediate contagion. The disease may be introduced into healthy herds by the introduction of infected pigs; exposure of swine in markets in infected areas is a fertile source of infection; so are vehicles and trucks in which pigs are conveyed from place to place; dealers, castrators who journey from farm to farm, and attendants may serve as agencies whereby contagion is conveyed.

Outbreaks are liable to recur in premises where the disease has existed previously, as the virus appears to retain its vitality for fairly long periods outside the animal body. Within a space of time which rarely extends to three weeks after exposure to infection, and may not be more than four days, the disease is ushered in by fever, the subsequent symptoms varying somewhat with the form the disease assumes. The animal has no appetite, is depressed, ill and separates itself from its companions; the conjunctivae are reddened and congested and may secrete a mucopurulent discharge; vomition is common, and constipation and diarrhoea are both met with; sometimes the faeces become dysenteric and the odour is peculiar and disagreeable

In a number of cases a skin rash develops, the parts principally involved being the region of the ears, the axilla, groin and the skin covering the abdominal area. The mucous membrane lining the mouth, fauces and pharynx may become inflamed, later ulcers form and become covered with a diphtheritic exudation As a result the animal is unable to feed and respiration is rendered difficult. The lungs may be the seat of pneumonic changes and the animal has then a short, dry and paroxysmal cough, a nasal discharge, difficulty in respiration, and the other symptoms characteristic of acute lung infection. Gastritis and enteritis are common. The animal lies about and if compelled to move does so reluctantly and sometimes with a staggering gait and an arched back; later it is unable to rise and becomes comatose

As in other acute septicaemic diseases, a hyperacute form may develop and death supervenes within a few days, or a less acute form may set in where one or more groups of organs become involved; a chronic type is also encountered, life drags on over a considerable period and the animal becomes more debilitated and emaciated and remains a possible source of infection to other pigs. Recovery occurs in some cases, the virulence of, and the mortality from, the disease varying widely in different outbreaks.

Methods of prevention consist in keeping of swine in properly constructed piggeries and observing the laws of modern hygiene. Present-day open-air methods of pig raising are of value. Fresh pigs introduced into premises must be submitted to isolation for a sufficient space of time, in order to allow the disease to develop, if present. a period of rather more than three weeks is desirable In infected areas every effort must be made to prevent the introduction of the contagion from outside sources When stud boars are kept special precautions are necessary and the law must be carefully observed.

Since pigs which have recovered completely from an attack of swine fever possess a high degree of immunity, attempts have been made to perfect a hyperimmune serum against the virus of the disease. This serum has been extensively used in various countries with good results and it possesses the power of protecting swine against the disease, provided it is administered before exposure to infection or in the early days after infection; obviously it can be of little service after the onset of the disease as it is not potent against the organismal secondary invaders. In herds where the disease exists it is desirable to use the serum upon those animals which are not showing symptoms of the disease and to slaughter the animals affected.

Since the protective power of the hyperimmune serum is expended after a few weeks, attempts have been made to confer an active immunity by mixing the immunized pigs with those affected with swine fever, in order that a natural attack of the disease may be developed in a very modified form. This method has been proved to be less dangerous than an alternative method which consists in the simultaneous injection of hyperimmune serum and virulent blood taken from an animal suffering from swine fever The former method, as stated, is preferable and it has given good results in practice, but it is not free from danger as some animals develop and die from the disease. (A. R. S.)

SWINEMÜNDE, port and seaside resort in the Prussian province of Pomerania, at the east extremity of the island of Usedom, and on the river Swine which connects the Stettiner Haff with the Baltic Pop. (1925) 18,213. The Swine, the central and shortest passage between the Stettiner Haff and the Baltic Sea, was formerly flanked by the fishing villages of West and East Swine. Towards the beginning of last century it was made navigable for large ships, and Swinemünde, which was founded on the site of West Swine in 1748, was fortified and raised to the dignity of a town by Frederick the Great in 1765. The entrance to the harbour, the best on the Prussian Baltic coast, is protected by two long breakwaters, and is strongly fortified. The fairway is 360–490 ft. wide, with a depth of 30 ft. at the quays.

SWINGING, a radio term denoting variation in intensity of a received radio signal resulting from changes in the frequency of the transmitted waves.

SWINTON, SIR ERNEST DUNLOP (1868–), British soldier, was born on Oct. 21, 1868, and commissioned in the Royal Engineers in 1888. In the South African War he was first adjutant and then commander of the 1st Railway Pioneer Regiment. In 1904 Swinton produced *The Defence of Duffer's Drift*, a tactical study which became an unofficial textbook in the British and Indian army, and an official one in the U.S. army. In 1909, when an instructor at Woolwich, he wrote, under the pseudonym of Ole-Luk-Oie, a book of short stories entitled *The Green Curve*, which, by its combination of literary power and military imagination, gained a wide reputation. Appointed secretary of the historical section, Committee of Imperial Defence, in 1910, he compiled the official history of the Russo-Japanese War. Soon after the outbreak of war in 1914 he was sent out to France as the official Military Correspondent ("Eyewitness"). His proposals to Sir Maurice Hankey, Secretary of the Committee of Imperial Defence, in Oct. 1914 became the first link in the causation of the machine gun and wire destroyer, afterwards christened the tank (*q.v.*). In 1915 he returned to England to become secretary to the War Committee of the Cabinet. In this capacity he had much to do with the preparation of the first tanks. In 1925 he was appointed professor of military history at Oxford.

SWINTON, an urban district in the West Riding of Yorkshire, England, 10½ m. N.E. of Sheffield on the L.M.S. and L.N.E. railways, at the junction of the Don navigation with the Dearne and Dove navigation. Pop. (1921), 13,912. The town was formerly renowned for its Rockingham ware.

SWINTON AND PENDLEBURY, an urban district in the Eccles municipal and parliamentary borough, Lancashire, England, 5 m. N.W. of Manchester, contiguous with Salford, with stations on the L.M.S railway. Pop. (1921), 30,916. The Swinton industrial schools were opened in Feb. 1846. The manufacture of cotton, and coal-mining are the chief industries. Anciently a large part of Swinton was possessed by the Knights Hospitallers of St. John of Jerusalem.

SWISS LITERATURE. Peculiarities of the geographical situation of Switzerland make it impossible to speak of a "Swiss" literature in the sense in which we speak of a French or English literature. Switzerland has occupied the position of a "marchland" to its three great neighbours, Germany, France and Italy; and the attraction of the languages of these three nations has exercised an overwhelming influence on Swiss letters. There has, however, almost always been a characteristically Swiss note in the books produced in the territory now known as Switzerland.

GERMAN

Switzerland remained substantially a literary dependent of Germany even after her political liberty had been achieved. Hadlaub and his contemporaries were rather local German, than Swiss, poets. At the time of the Reformation, there was a momentary danger that German Switzerland would develop an Alemannic literary language differing from that of Germany. Fortunately this differentiation has been confined to the popular spoken language of "Schweizer Deutsch" (which, however, plays also a respectable rôle in letters), and Swiss writers in German were able to retain the wide public of German-speaking nations.

The abbey of St. Gall was a cradle, not only of Swiss literature, but of German letters in general, at a time corresponding to our Anglo-Saxon period. For details, *see* the articles St. Gall, Notker, Hymns, Waltharius, German Literature, etc. For our purposes we may begin this sketch with the League or Pact of 1291 (*see* p. 681 *infra*). That document, indeed, was written in Latin; but all later alliances (such as, *e.g.*, the Priests' Ordinance of 1370) were drawn up in German. This was the period of the German minnesingers (*q.v.*), at least 30 of whom are known to have originated at Zürich and other parts of what is now German Switzerland. The Codex Manesse (now in Paris), compiled by the (Swiss) father and son of that name, dates from the beginning of the 14th century and includes specimens of 141 poets. Master John Hadlaub (13–14th centuries), perhaps the most important Swiss minnesinger, forms the subject of a charming tale by Gottfried Keller (*q.v.*) and contributed not a little to the growth of Swiss nationalism and patriotism. Other prominent names are Rudolf von Fenis, count of Neuchâtel (12th or 13th century), who was much influenced by the Provençal troubadours, and Berthold Steinmar of Argovia, of original and vigorous talent.

Fables and Popular Songs.—In Switzerland, as in Germany, the romantic lyric and epic of the minnesinger period were followed by an age of more prosaic and didactic work. It may be said to be ushered in by the *Edelstein*, a versified collection of fables by Ulrich Boner, a Dominican friar of Berne (first half of the 14th century), with which may be mentioned *Der Ring* of Heinrich Wittenberger (Thurgau), a sort of comic epic, and the *Schachzabelbuch*, an allegorical poem by Konrad von Ammenhausen (1347). The *White Book* of Sarnen (*c.* 1470) and the chronicle of Melchior Russ of Lucerne (1482) contain the earliest mentions of William Tell (*see* Tell). Diebold Schilling of Berne (1484) gives us a stirring narrative of the Burgundian wars. More interesting, perhaps, to lovers of literature are the popular songs, especially the war songs celebrating the marvellous victories of the early Swiss. One of the earliest and most famous of these commemorates the battle of Sempach (1386) and the heroism of Arnold von Winkelried (*q.v.*), familiar in the later version associated with the name of Hans Halbsuter of Lucerne (1541). Similar songs celebrate the victories of Naefels (1388), Grandson (1476), Morat (1476), Nancy (1477), and Giornico (1478).

The beginnings of the drama in German Switzerland resembled those in Germany. Indeed, the earliest known ms. of a Passion play emanates from the abbey of Muri in Argovia (early 13th century). Switzerland also had its share of the secular *Fastenspiele* of Shrovetide, the best known of which is *Der Kluge Knecht*, by an anonymous author of the 15th century.

Switzerland shared also in the production of the mystical and humanist writings that heralded the Reformation. Perhaps the most notable Swiss mystic is Elsbeth Stagel (d. *c.* 1355), a nun of Töss, near Zürich. She was an ardent disciple of the German mystic Heinrich Suso (b. at Constance).

The first stirrings of Humanism in Switzerland may be attributed to the visit of the Italian scholar Poggio to St. Gall (1416) and to the Councils of Constance (1416–18) and Basle (1431–49). Aeneas Sylvius, present at the latter, founded the University of Basle a little later (1459). A zealous disciple of these two scholars was Niklaus von Wyl, an Argovian (b. *c.* 1410), who is an outstanding figure in the chronicles of Humanism.

Effects of the Reformation.—The literature of German Switzerland in the 16th century was, like that of French Switzerland, mainly a product of the Protestant Reformation. Though Zwingli was a less powerful literary force than Luther or Calvin, his enthusiasm for progress included many secular as well as religious interests. The Zürich Bible, largely consisting of Luther's version, was issued in 1531. The drama, too, still in a somewhat primitive form, was mainly in the hands of the Protestants. Zwingli's colleague and successor Heinrich Bullinger (*q.v.*) wrote at least one play. The most prominent literary name of the period is that of Nicholas Manuel (1484–1550), the painter, who wrote also many plays and satires. Jakob Ruf (d. 1558) resuscitated (1545) the old *Urnerspiel*, dealing with the William Tell legend.

The chroniclers of the 16th century are of more significance for us than the drama, inasmuch as they deal with still-living facts. Among the most important are the brilliant and fanciful Giles Tschudi (*q.v.*), though he wrote mainly in Latin; Johannes Stumpf (*q.v.*), an annalist of more accuracy if of less charm; and Josias Simler (*q.v.*), who wrote in Latin. Joachim von Watt of St. Gall, known as Vadianus (1484–1551), compiled an interesting chronicle of the abbots. Valerius Anshelm (d. 1540) told the story of Berne down to 1536. Bullinger (*q.v.*) and Hans Salat (d. *c.* 1552) wrote narratives of the Swiss Reformation from opposite points of view. The journal of Andreas Ryff (1550–1603) gives us a picture of the daily life of a pious merchant of the day. The autobiographies of the father and son, Thomas and Felix Platter (d. 1582 and 1614), are among the most charming prose works of the period. Konrad von Gessner (*q.v.*) wrote in Latin

and ranks as a naturalist and scholar rather than as an author. The realm of imaginative prose is scantily represented by Wilhelm Ziely (d. *c.* 1542), who translated French romances, and Johann Wetzel, who published oriental tales, after an Italian model.

The 18th Century Revival.—Signs of revival begin with the 18th century. Zürich, Berne and Basle were the chief literary centres. The prevailing spirit was one of liberal Protestantism; one indication of this being the growing influence of English authors at the expense of French Friedrich Drollinger (1688–1742) of Basle (though born in Baden), translator of Pope, forms a link with the revival of Swiss literature represented by Haller of Berne and Rousseau of Geneva.

Albrecht von Haller (*q v*), though specially distinguished as a scientific writer, is a notable figure in pure literature, both for his contemporary influence (in Germany as well as in Switzerland) and as one of the first of the early authors who is still read with appreciation His long poem on the Alps (*Die Alpen,* 1732) did much to stimulate Swiss patriotism and interest in Swiss scenery; and his friend Goethe called him "the father of national poetry" His son, Gottlieb Emanuel von Haller (1755–86), produced, in his *Bibliothek der Schweizergeschichte,* a work that is still indispensable to the historical student Among Haller's followers are the poets J. K. Peyer of Sachshausen (1707–68), Samuel Grimm of Burgdorf (1733–94) and Vinzenz von Tscharner of Berne (1728–78).

A prominent literary figure of Basle in this period was Isaac Iselin (1728–83), the chief begetter of the Helvetic Society (*see* below), whose treatises on the philosophy of history (*Geschichte der Menschheit,* 1764) and ideal philosophy (*Philosophische und Patriotische Träume eines Menschenfreundes,* 1775) were eloquent expositions of the idealistic and patriotic movement of his day. Otherwise Basle was more prominent as a scientific centre, notably with the eminent mathematicians, Leonard Euler (*q.v.*) and the Bernoullis (*q v.*).

Zürich as Intellectual Capital.—But the real intellectual capital of Switzerland in the 18th century was Zurich, the "Athens on the Limmat." The most prominent names are those of Johann Jakob Bodmer (*q.v.*) and John Jakob Breitinger (1701–76), who, though not themselves stars of the first magnitude, had an important effect in extricating German literature from its old shackles and guiding it into a more promising course. They were much influenced by Milton, Shakespeare and other English writers, and were violently, but unsuccessfully, opposed by Gottsched, the leader of the Saxon or "French" school In 1721–23 Bodmer and Breitinger carried on the *Diskursen der Maler,* a periodical to spread their views, while more elaborate and systematic expositions of their critical doctrine as to poetry were set forth in Bodmer's *Kritische Abhandlung von dem Wunderbaren in der Poesie* (1740) and Breitinger's *Kritische Dichtkunst* (1740).

Among the most important Zürich contemporaries of Bodmer were Salomon Gessner (*q.v*), the pastoral poet; J. H. Pestalozzi (*q.v.*), the educationalist; and J. K. Lavater (*q.v.*), now best remembered as a physiognomist and phrenologist, though his lifetime influence was great in many other fields Johann Caspar Hirzel (1725–1803) is notable for his *Wirthschaft eines philosophischen Bauers* (1761), the record of "Kleinjogg," a village Socrates, which attained great contemporary popularity Johann Georg Sulzer (1720–79) claims attention for his *Allgemeine Theorie der schonen Kunste.* Hirzel was one of the founders of the Helvetic Society (1761).

Of other Swiss writers of this period, not specially associated with the three towns named above, one of the best known is J. G. Zimmermann (*q.v.*), the enthusiast for solitude. Johannes von Müller (*q v.*) wrote the first detailed history of Switzerland, a book of influence and importance. J H. Zschokke (*q v.*), a Swiss by adoption, also wrote a popular Swiss history, but is best known for his numerous short stories. J. J. Hottinger (1763–1860) and the brothers G. and F. von Wyss (d. 1893 and 1907) are also noteworthy historians (of a somewhat later date).

The Napoleonic Period.—This was naturally, for Swiss literature, more or less sterile; but the democratic revival after 1830 was as marked in letters as elsewhere.

Three names stand out at this time above all others—Albrecht Bitzius (*q v*), better known as "Jeremias Gotthelf," the novelist of peasant life; Gottfried Keller (*q.v.*) a very representative Swiss novelist and poet; and Conrad Ferdinand Meyer (*q.v.*), another poet and novelist, of more cosmopolitan leanings and tastes. Other notable writers are: Johann Martin Usteri (1763–1829), one of the earliest dialect poets; Gaudenz von Salis-Seewitz (1762–1834), a Grisons poet, known to English readers by Longfellow's version of his *Song of the Silent Land;* U Hegner (1759–1840) and D. Hess (1770–1843), two novelists of local colour; Gottlieb Jakob Kuhn (1775–1845), a well-known dialect poet; J. R. Wyss (1781–1830), author of the Swiss national anthem (*Rufst du, mein Vaterland?*) and son of J. D. Wyss, writer of *The Swiss Family Robinson;* K. R. Tanner (d 1849), a lyric poet; Jakob Frey (1824–75), a follower of Bitzius; A. E. Fröhlich (*q.v.*), the fabulist; Jacob Burckhardt (*q.v.*), author of the *Cicerone;* the Zurich poets, L Widmer (1806–68), H Leuthold (1827–79), and A Corrodi (1826–85); J. J. Bachofen (1815–87), a writer on Rome and Roman law, whose works have recently made a new and strong appeal; and F. Schmid (1823–88), a metaphysical poet.

Writers of the 20th Century.—Among writers whose activity belongs in whole or part to the 20th century, the outstanding name is that of Carl Spitteler (*q.v*), a really great epic and lyric poet. With him may be named his friend J. V. Widmann (*q v*), a poet and dramatist of taste and distinction. R Faesi, H Federer, A Frey, J C Heer, A. Huggenberger, Paul Ilg, Max Pulver, J. Schaffner, A Steffen and Ernest Zahn are all writers of mark. Other noteworthy poets are Gottfried Bohnenblust, H Hiltbrunner (*Werk der Welt,* 1927), Siegfried Lang, Karl Stamm (1890–1919), Dominik Muller, F. Hofer and Isabella Kaiser (*Mein Herz*), who writes both in French and German The chief dialect poets include Meinrad Lienert (b. 1865), the "Swiss Hebbel"; Otto von Greyerz; and Joseph Reinhart. Novelists and story-tellers of note, besides those already mentioned are. J Bosshart (1862–1924), whose later works showed great power (e g., *Ein Rufer in der Wuste*); J Buhrer (*Aus Konrad Sulzers Tagebuch*); A. Frankhauser (b 1890); John Knittel, who writes in English (e g., *Aaron West,* with preface by R. Hichens, and *Into the Abyss,* 1927); Felix Moeschlin (*Die Konigschmieds*); W Siegfried (*Tino Muralt*); A. Vögtlin; Robert Walser; Maria Waser (*Wir Narren von Gestern*); Lisa Wenger (*Was das Leben mir lehrte,* 1927); and Otto Wirz (*Gewalten eines Toren,* 1922). The leading story-writers in dialect are R. von Tavel (*Veteranezyt,* 1927), J. Reinhart (*see* above), and Simon Gfeller (*Meieschossli; Heimisbach; Aemmegrund,* 1927).

Among the best critics, essayists and biographers of the day are C. A Bernoulli, notable for his books on Nietzsche (1910), Bachofen, and others, and also the author of plays and novels, G. Bohnenblust (*see* above), Emil Ermatinger, an authority on German literature and author of a vigorous romance (*Der Weg ins Leben*); O von Greyerz (*see* above); R. Faesi (*q.v.*); and Eduard Korrodi. Among historians we may note Wilhelm Oeschsli, whose admirable *History of Switzerland from 1419 to 1919,* has been turned into English by E. and C. Paul (1922); Eduard Fueter, author of *Die Schweiz seit 1848* (1927); and Ernst Gagliardi, author of *Dokumente zur Geschichte des Burgermeisters Hans Waldmann, and of Geschichte der Schweiz,* of which the concluding volume, covering the history of Switzerland from 1848 to 1926, appeared in 1927.

FRENCH

French established itself in the 13th century as the written language and the vehicle of law in the districts which form French Switzerland. Between that time and the Reformation, however, little original literature was produced. Some chronicles, a few fragments of mysteries, and one or two romances printed at Geneva towards the end of the 15th century, are almost all that remain. The literary age begins with the intellectual impetus supplied by the Reformation. The *Histoire littéraire de Genève*, published by Senebier in 1786, gives an idea of the abundant literary production of a single Swiss city.

The Age of Rousseau.—Even in the 18th century it cannot be said that a national literature existed in French Switzerland. Yet at this period the Protestant cities of refuge became intensely interested in literature, and taste began to be cultivated by the patrician and bourgeois classes. The atmosphere of the Reformation mingled with that of the 18th century. French Switzerland has at no time been more cosmopolitan in the best sense of the word; it has never been a more brilliant intellectual centre or a more active laboratory of new ideas.

The works of Rousseau and Madame de Staël, and Benjamin Constant's *Adolphe*, are the main contributions of Switzerland to French literature during the 18th and early 19th centuries.

The Swiss literary movement, which became more national in the last century, stood somewhat apart from that of France. The Swiss writers are given to thought and self-examination; they are seekers after truth, less ready to complain of destiny than to acknowledge their own shortcomings, plain citizens who are at the same time dreamers. The greatest modern novelist of French Switzerland, C. F. Ramuz, is principally famous for the pictures he gives of his native country; the same is true of the poet Juste Olivier, and, still earlier, of the racy stories of Rodolphe Töpffer.

Vinet and Amiel.—Although, however, the writers who describe the picturesque features of local life occupy an important place in French Swiss literature—they are, indeed, primarily depicters of their land and their nation, and only secondarily novelists or short story writers—the first place is due not so much to them as to the critics and moralists. It was Vinet (1797–1847) and Amiel (1821–81) who first extended the intellectual prestige of French Switzerland beyond the frontiers.

Among the poets of French Switzerland, very few reveal a stormy temperament or make their passions and their griefs the subject of their art. Swiss lyrical poetry is the product of a happy people. Sometimes it is religious in character, and sometimes an Alpine note is struck (Juste Olivier, 1807–76, Eugène Rambert, H. Warnery).

Writers of Fiction.—It is curious that the interest in moral observation and self-analysis which prevailed in the 19th century should not have led to the development of the analytical novel. Töpffer (1799–1847) wrote short stories of middle-class life and imaginative sketches, descriptions of things seen in wanderings through the town or among the mountains. Eugène Rambert was a writer of Alpine idylls. Philippe Monnier (1864–1911), also a humanist, wrote detailed descriptions of Geneva and of his own village. It is not surprising that a Genevese, V. Cherbuliez (1829–90) should have created the cosmopolitan novel in France. Edouard Rod (1857–1910), who also gained fame in Paris, betrays his French Swiss origin by the interest he shows in the internal moral conflicts of his characters.

Early in the present century a change began to take place both in the spirit and in the technique of the literature of French Switzerland. The didactic, moral and eclectic elements—the Protestant spirit, in short—have become less conspicuous. The past is almost repudiated. There is still a lack of dramatic literature (though mention should be made of the rustic theatre of Mézières, Vaud and of R. Morax). The modern poets write in an easier style than their predecessors (Henry Spiess, R. L. Piachaud, P. Girard). Even now, however, there are more descriptive writers and recorders of rural life than novelists proper. The chief names to be mentioned are those of the great Vaudois writer C. F. Ramuz, B. Vallotton, Noëlle Roger, and the creators of the new analytical school, Robert de Traz and Jacques Chenevière.

For the 18th century: G. de Reynold, *Le doyen Bridel et les origines de la littérature suisse romande* (1901). For the 19th century, *see* the summary by C. Clerc in Bédier and Hazard's *Histoire de la littérature française*, vol. ii., pp. 326 *et seq.* (1924). For the beginning of the 20th century; P. Kohler, *La Littérature d'aujourd'hui dans la Suisse romande* (1923).

ITALIAN

Italian Switzerland is best known by its artists, while its literature is naturally subject to strong Italian influences, and not to any of a strictly Swiss nature. Stefano Franscini (1796–1857) did much for his native land, especially in educational matters, while his chief published work (1835) was one that gave a general account of the canton of Ticino. But this is not so thorough and good as a later book by Luigi Lavizzari (1814–1875), entitled *Escursioni nel cantone Ticino* (1863) which is very complete from all points of view. Angelo Baroffio (d. 1893) and Emilio Motta represent the historical sciences, the latter contributing much to the *Bolletino della Svizzera Italiana* (from 1870 onwards), which, though mainly historical, devotes much space to literary and historical matters relating to the canton. The art of novel writing does not flourish in Ticino. But it has produced a great number of poets such as Pietro Peri (1794–1869), who translated the Swiss national anthem into Italian, J. B. Buzzi (1825–1898), Giovanni Airoldi (died before 1900) and Carlo Cioccari (1829–1891)—the two former were lyric poets, and the third a dramatist. The younger poets are F. Chiesa and M. A. Nessi. Possibly the most conspicuous literary figure of the moment is Luigi Zoppif, who wrote *L'Esteta*.

SWISSVALE, a borough of Allegheny county, Pennsylvania, U.S.A., 6 m. S.E. of Pittsburgh, on the Pennsylvania railroad. Pop. (1920) 10,958 (82% native white); 1928 local estimate over 18,000. It is an important manufacturing centre, with an annual output valued at $16,000,000.

SWISS WARS, 1315–1529. When the central organization of the Holy Roman Empire broke down in the thirteenth century, there were certain communities which had not yet slipped into subordination to the feudal states which were to replace the emperor as the practical governing authority in Germany. The origin of Switzerland in its modern sense lies in the fact that the men of Uri and Schwyz obtained in 1231 and 1240 respectively *Freiheitsbriefe*, or charters of liberty from Frederic II., declaring them to be free from comital authority and direct vassals of the crown. How Unterwalden, the third original member of the Old-Swiss union, got its claim to a similar immunity is not clear. But in 1291 these "Three Original Cantons" formed the so-called "Eternal Alliance" which bound them to mutual support, and pledged them to submit to no external authority.

The danger to the primitive Swiss lay in the House of Habsburg; not because two of its members achieved the Imperial crown in the late 13th century, but because its heads (whether crowned or uncrowned) were the holders of the largest feudal accumulation of land in what is now Switzerland. From first to last the Habsburgs were great at land-grabbing: hence it was not strange that the "Three Cantons" supported all claimants to the imperial crown outside the Habsburg family—such as Henry VII. of Luxemburg and Louis of Bavaria.

As nominal partisans of Louis of Bavaria against his rival for the crown, Frederic of Habsburg, the Schwyzers had sacked the abbey of Einsiedeln in 1314, on the pretext that the abbot held to the other allegiance. It was this casual raid which was destined to bring the name of Schwyz into general knowledge for the first time. The counter-emperor Frederic directed his brother Duke Leopold to chastise this nucleus of Bavarian partisans in a region close to the main Habsburg holding in south Swabia. Hence came the battle of Morgarten (1315). Leopold of Austria with the knighthood of the Hapsburg lands in Swabia, and some town-levies of infantry from Zürich and Zug, started

out in November to chastise the Swiss. The mountaineers took post in the narrow defile of Morgarten, between the lake of Egeri and the steep hills above They had blocked the road with a wall of rough stone, and hidden themselves in folds of the adjacent upper slopes. Duke Leopold who had taken no precautions of reconnaissance, came unexpectedly upon the stone barrier, with his army strung out in file for half a mile behind He hastily ordered his vanguard to pull down the obstacle and drive off the men behind it. But while it was thus engaged the Swiss charged down on the whole flank of the Austrian line of march, heralding their approach with a shower of boulders and tree trunks which had been laid above the road. The unfortunate knights, unable to advance or retreat, or to wheel their horses to charge up an impracticable slope, were mostly hurled into the lake by the first onset. The duke cut his way out; the infantry in the rear fled

A second exploit, 25 years later, forms a much more serious episode in the history of the art of war. The result of Morgarten had been that other towns and rural communities in the Alps had adhered to the original cantons and sought their alliance against the local princes. In 1339 the town of Berne, the most important urban centre in the land, being at odds with the count of Kyburg concluded a treaty with the cantons. This roused against them the whole feudal aristocracy as far as the Jura, and the counts of Kyburg, Neuchâtel, Gruyère and Nidau, the Lord of Vaud, and many other magnates marched against Berne, and laid siege to the town of Laupen The confederates sent succours to the Bernese, and a general action was fought on June 21, 1329 on the hillside above Laupen This was no fight in a narrow defile unfavourable to horsemen, but a pitched battle, in which for the first time the Swiss used the deep infantry column, which was to be their favourite formation in after years The lords of the lowlands charged a dozen times against the phalanx formed by the men of the Forest Cantons without breaking it, and when attacked in flank by the other half of the Swiss army, the levy of Berne gave way and retreated, leaving 80 barons and hundreds of men-at-arms dead upon the field

Naturally, after such a display, the confederacy was joined by many new members, both urban and rural, including the considerable towns of Zurich and Zug They could then challenge the Habsburg supremacy in northern Switzerland, and in 1386 provoked Duke Leopold the Valiant, nephew of the elder Leopold of Morgarten, by invading his dominions On July 9 of that year the duke, having collected the knightly levy of his Swabian and Tirolese dominions, and hired many mercenaries, marched against Lucerne, the most central strategical point of the confederacy. The greater part of the Swiss forces were at the moment campaigning near Zurich, far away; and it was only the levies of the four Forest Cantons which met Leopold on the hillside of Sempach, above the lake and town of the same name, as he found his way up one of the roads to Lucerne

By this time the deductions which feudal Europe had drawn from the battles of Crécy and Poitiers, were prevailing in Germany no less than in France. Leopold, like John of Valois at Poitiers, dismounted all his knights save a reserve of mounted men, and strove to oppose to the phalanx of the Swiss infantry a better and more heavily armoured mass of men-at-arms on foot, fighting with the long lance The crash was tremendous, the front rank on both sides went down, but the impetus of the Swiss prevailed—we are told that after a time the knights were tired out by the very weight of their panoplies The reserve of horse misbehaved, and rode off when the duke and his banner fell

In their earlier battles the Swiss used the halberd, the equivalent of the English bill, more than the pike. But in their developed tactics of the 15th century we find the pike predominant, no doubt because it was a more effective weapon for beating off cavalry charges In their later wars we find them usually advancing in an échelon of three deep columns of pikes, with a vanguard thrown forward, a main-battle to its side and rear, and a rearguard column again to the side of the main-battle but not level with it They had a certain number of light troops, crossbowmen and in the later decades hand-gun men, who were thrown out on the flanks to screen the advance. But it was always the weight of the column and its impenetrability which won the day. In cases where the Swiss force was much outnumbered, and failed to break up the enemy, it would fight a defensive battle with desperate obstinacy. At Arbedo in 1422 the invaders of the duchy of Milan were beaten by the great Condottiere Carmagnola, but won themselves a retreat without overwhelming loss. At St. Jacob in 1444 an isolated corps of less than a thousand men, surrounded by ten times their strength, were not exterminated till they had laid low twice their own number of the Armagnac mercenaries of the dauphin Louis They were very hard to break when they had "formed the hedgehog" as their captains called the solid square with pikes projecting on all sides

Both Granson (March 2, 1476) and Morat (June 22, 1476) were examples of the Swiss tactics of rapid advance in échelon against an enemy taken somewhat by surprise, and attacked before he had assumed his intended fighting position. At Granson Charles of Burgundy, who had just captured (and hanged) the Swiss garrison of that town on the lake of Neuchâtel, got short warning that the confederates were descending on his camp from the hills of Mount Aubert. The duke was getting his line formed, when the first Swiss column, well ahead of the other two, came rushing down on his left wing. Charles charged it ineffectively with his cavalry, which failed to break in, but at least stopped its advance He was then preparing to turn his artillery against its front, and to wheel the infantry of his centre round its flank, when the second and third Swiss columns came rushing down the slopes, and caught the Burgundian guns and infantry while both were on the move and exposing themselves to a lateral attack. Instead of fronting to face the new assailants, the duke's infantry fled in panic, and he was forced to abandon his cannon, and quit the field with his cavalry, much of which was still in fair order. His loss had been only 1,000 men, but his guns, his camp, and his treasury fell into the hands of the victors, who had about 200 casualties—all in the leading column. Charles was convinced that he had been defeated only because he had been surprised, and because his infantry had misbehaved in a sudden crisis He resumed his attack on the Swiss in June, by laying siege to the little town of Morat on the lake of the same name He fortified himself with lines of entrenchments facing outward, on the hills lying above both sides of the town, and having garnished the palisades with his numerous artillery (he had completely replaced the losses of Granson) waited to be attacked in position His cavalry were to be held in reserve, till the Swiss column should have shattered themselves against the entrenchments

The fault of the position was that a dense wood lay opposite it, giving illimitable cover and the duke was heedless enough to neglect reconnaissance to see what was beyond the broad belt of timber He had been waiting ten days to be attacked, before the Swiss appeared in front of him on June 21 in great force. On the following morning the Burgundian army waited behind its palisades for many hours, till the day broke up with blinding and continuous rain-storm. No attempt seems to have been made to "feel" the enemy, who was known to be behind the woods. After noon was past the duke, making up his mind that the weather was too bad for fighting, sent his main body back to their camp to feed and get shelter, leaving only the guns, and a line of posts behind the palisades.

This was the moment for which the Swiss had been waiting—their leading column emerged from the corner of the woods, and ran, half hidden by the pouring rain, straight at the southern end of the Duke's entrenchments. The artillery salvo tore some deep holes in the phalanx, but before the guns could make a second discharge, the Swiss were over the ditch and across the palisades, where they found but few enemies on guard The second and third columns followed the first, carrying, almost without resistance, all the southern half of the duke's lines. Charles however did not consider the day lost, and led his army up from its camp, in great disorder, as quickly as each corps could form, to drive the Swiss out of the entrenchments. Disaster naturally followed—there was no line of battle whatever—and though many of the Burgundians fought well, the down-rush of the enemy's columns swept the whole of the duke's army into and over the camp on

the lake-shore. There was a frightful massacre to follow, for the troops in Charles's centre were driven into the lake and exterminated, their line of retreat having been cut. Those on his northern wing, who had never been attacked, escaped by taking a détour toward the further end of the lake. But at least 7,000 out of the duke's 20,000 men had perished by the sword, or by drowning.

It is strange to find that after two such experiences as Granson and Morat, Charles lost his last battle and his life at Nancy, in 1477, by allowing himself to be once more surprised.

For the next 30 years the Swiss infantry were the model and terror of all central Europe. This was the age in which Machiavelli describes them as "marching with 10,000 or 15,000 pikemen against any number of horse, and winning a general opinion of their excellence from the many remarkable services that they performed." They smote the Emperor Maximilian's Swabian and Tirolese levies as their ancestors had smitten those of his kinsmen, the two Leopolds, at Morgarten and Sempach—moving in square through his countryside, beating off his knights from their "hedgehog" front, and trampling down his infantry bands, the landsknechts, whom he had trained to fight after the Swiss fashion in column and with serried depth of pikes. In Italy the confederates made and unmade princes, selling their service where it was profitable, rather than seeking for the general advantage of their confederacy.

Meanwhile the Renaissance, many-sided in things military as in every line of thought, was producing scientific soldiers who were pondering on the problem of how to deal with the hitherto invincible column of pikes. Some found the solution which ancient Rome had used against the Macedonian phalanx, the Spanish sword and buckler, fatal against the pikeman if once a hole had been bored in his array. Machiavelli saw and praised this tactic—the bearer of a long weapon is helpless when his opponent has got in close and can stab. There was an interesting example of this sort of slaughter at the battle of Ravenna. But the Spanish sword and buckler were only found in one national army, and no one else took up their device. More effective was the idea (imperfectly tried by Charles of Burgundy at Morat) of field-fortification supplemented by firearms—if only the Swiss could be induced to attack frontally. Sometimes they did, and were shot down helplessly as at Bicocca (1522). More scientific, and perhaps the most decisive of all the tactics which broke the reputation of the Swiss infantry, was another idea which Charles had failed to exploit successfully. Cavalry charges from the side can force the phalanx to halt, since it must form front to flank to beat them off. Even if repulsed, they stop its advance.

It was the battle of Marignano (Sept. 13, 1515) which displayed this fatal drawback to the Swiss tactics. When the great column of pikemen broke into the French line, Francis I. led no less than 30 successive charges against its flanks, with small bodies of a few hundred men-at-arms. Each was repulsed for several hours, but meanwhile the whole of the French artillery concentrated on to the front of the phalanx, which at last was so torn to pieces that it had to retire with the loss of half of its numbers or more. Gunpowder thus turned out to be the poison which destroyed the power of the Swiss pikemen. (C. W. C. O.)

SWITCH PLANTS, a botanical term for plants, such as broom, with leaves very small or absent, and slender green shoots.

SWITHUN (or SWITHIN), **ST.** (d. 862), bishop of Winchester and patron saint of Winchester Cathedral from the 10th to the 16th century. He is scarcely mentioned in any document of his own time. His death is entered in the *Anglo-Saxon Chronicle* under the year 861; and his signature is appended to several charters in Kemble's *Codex diplomaticus*. Of these charters three belong to 833, 838, 860–862. In the first the saint signs as "Swithunus presbyter regis Egberti," in the second as "Swithunus diaconus," and in the third as "Swithunus episcopus." Hence if the second charter be genuine the first must be spurious, and is so marked in Kemble. More than a hundred years later, when Dunstan and Ethelwold of Winchester were inaugurating their church reform, St. Swithun was adopted as patron of the restored church at Winchester, formerly dedicated to St. Peter and St. Paul. His body was transferred from its almost forgotten grave to Ethelwold's new basilica on July 15, 971, and according to contemporary writers, miracles accompanied the translation.

The revival of St. Swithun's fame gave rise to a mass of legendary literature. The so-called *Vitae Swithuni* of Lantfred and Wulstan, written about A.D. 1000, hardly contain any germ of biographical fact; and the earliest detailed authority is a biography ascribed to Gotzelin (*fl.* 1058–78). From this writer, who has perhaps preserved some fragments of genuine tradition, we learn that St. Swithun was appointed bishop of Winchester under Aethelwulf. At his request Aethelwulf gave the tenth of his royal lands to the Church. He died on July 2, 862, saying that he was not to be buried within the church but outside in "a vile and unworthy place."

William of Malmesbury adds that, as Bishop Alhstan of Sherborne was Aethelwulf's minister for temporal, so St. Swithun was for spiritual matters. The same chronicler uses a remarkable phrase in recording the bishop's prayer that his burial might be "ubi et pedibus praetereuntium et stillicidiis ex alto rorantibus esset obnoxius." This expression has been taken as indicating that the well-known weather myth contained in the doggrel lines—

St. Swithin's day if thou dost rain
For forty days it will remain;
St. Swithin's day if thou be fair
For forty days 'twill rain na mair—

had already, in the 12th century, crystallized round the name of St. Swithun; but it is doubtful if the passage lends itself by any straining to this interpretation.

The so-called lives of St. Swithun written by Wulstan, Lantfred, and perhaps others towards the end of the 10th century may be found in the Bollandist *Acta sanctorum* (July), i. 321–327; Mabillon's *Acta SS. O. B.* vi. 70, etc., vii. 628, etc.; and J. Earle's *Life and Times of St. Swithun*, 59, etc. *See* also William of Malmesbury, *Gest. reg.* i. 150, and *De gest. pont.* 160, 167, 179; Florence of Worcester, i. 168; T. Rudborne ap. Wharton's *Anglia sacra*, i. 287; T. D. Hardy's *Cat. of mss.* i. 513–517; J. Brand's *Popular Antiquities;* R. Chambers's *Book of Days:* Ethelwulf's *Tithe Charters*, nearly all of which refer to St. Swithun in the body of the text, may be studied in Haddon and Stubbs's *Councils*, iii. 636–645.

SWITZERLAND (Ger. Schweiz; Fr. Suisse; It. Svizzera). The Swiss Confederation consists of 22 cantons with a republican and federal Constitution. It is situated in central Europe and bounded north by Baden and Württemberg (Germany), east by Vorarlberg and Tirol (Austria) with the small principality of Liechtenstein lying between Vorarlberg and Switzerland, south-east and south by Trentino, Lombardy and Piedmont (Italy), and south-west, west and north-west by the departments of Haute Savoie, Jura, Ain, Doubs, Haute-Rhin (France).

Relief and Structure.—Switzerland extends between 45° 49′ and 47° 48′ 30″ N. lat., and from 5° 58′ to 10° 30′ E. long. It forms an oval-shaped mass of which the greatest length (west-south-west to east-north-east) is 226 m., and the greatest breadth (north to south) is 137 m. It has little or no physical unity, consisting as it does of numerous small districts, differing widely in language, religion, ethnology and customs, bound together in a political alliance, made originally for common defence. Its political boundaries are natural only for short distances.

In summary, Switzerland of to-day consists of three great river valleys (Rhône, Rhine and Aar), lying to the north of the main chain of the Alps and including within their Swiss basins all the region between the Alps and the Jura. In addition, the wedge-shaped canton of Ticino runs south from the St. Gotthard massif and drains to the Po, whilst in the extreme east a tongue of the Grisons canton drains north-east via the Engadine, into the Danube. The Rhône and Rhine valleys are shut off from that of the Aar by the great northern ridge of the Bernese Oberland and Tödi Alps. The Aar valley is wide and undulating, but the upper Rhine and Rhône have cut deep trenches in the structural depression which separates the great parallel chains. The main chain of the Alps provides the loftiest wholly-Swiss summit (15,217 ft.) in the crowning Dufourspitze of Monte Rosa, though the Dom (14,942 ft.) in the Mischabel range, immediately north of Monte Rosa, is the highest entirely Swiss mountain mass. The highest summit in the northern parallel ridge is the Finsteraarhorn (14,026 ft.) in the Bernese Oberland, while the lowest level

within the confederation is on the Lago Maggiore (646 ft.).

The geological build of the Alps (*q.v.*) has been proved to be exceedingly complex; the contorted, folded, and even overfolded recent rocks have been fractured, exposing old crystalline cores to denudation; the Jura (*q.v.*) are much less complicated in their folding and in their exposures. Much of the central hummocky plain is covered with undisturbed very recent rocks of Oligocene and Miocene age, many of which are marine deposits formed at a period when an arm of the Mediterranean spread up the present Rhône course along the outer border of the Alps as far east as Austria. These deposits are concealed in many parts of the plain by the most recent glacial and alluvial accumulations.

Hydrography.—The present confederation drains into the North sea, Mediterranean sea (direct), Adriatic sea and Black sea which, respectively, receive the Rhine, Rhône, Ticino-Po and Inn-Danube The Swiss portions of their basins are approximately: 11,160, 2,760, 1,360 and 660 sq miles.

Many of her *rivers,* with their Alpine origin, tend to seasonal overflows which have necessitated artificial embankment. The most important control scheme was that of Conrad Escher of Zürich (later Conrad von der Linth) who, in 1807–27, turned the turbulent Linth into Walensee, from which it emerges as a canalized stream. An earlier (1714) successful work was the diversion of the troublesome Kander into the Lake of Thun, where it is now placidly building an extensive fertile delta.

The *lakes* of Switzerland are very numerous: the largest, Geneva (S W) and Constance (N.E) are on the frontiers and are not wholly Swiss. Neuchâtel (92½ sq m.) is the largest wholly-Swiss lake. About 30 sq m. at the north end of Lago Maggiore (143 sq m) belongs to Switzerland; next in order of size are Lucerne, Zurich, about half of the Swiss-Italian Lake of Lugano (20 sq m.), Thun, Brienz, Morat, the Wallen, and Sempach (5½ sq m.); no others exceed 4 sq. miles Eleven of these lakes are in the Aar basin, two (Maggiore and Lugano) are in the Po basin, and Geneva is the great Rhône filter. The lakes of the Swiss portion of the Inn basin are small; the largest are Sils (1½ sq m.), and the still smaller, slightly lower and adjacent Silvaplana. Many small mountain lakes are of interest, such as the dreary Daubensee (7,264 ft. alt) near to the Gemmi pass, the extremely beautiful Oeschinensee (5,223 ft alt) mirroring the snowy Blümlis Alp, and the remarkable, though sometimes empty Märjelensee (7,766 ft. alt) on which float miniature icebergs from the Great Aletsch glacier.

Of the countless *waterfalls* in Switzerland those of the Rhine (near Schaffhausen), 100 ft. high, inclusive of rapids, and 340 ft. wide, are the grandest, but the most beautiful are of less volume and greater height, such as those of the Lauterbrunnen valley and particularly the Staubbach, a mere veil of water hanging in front of a precipice 1,000 ft. high.

Switzerland contains many more *glaciers* than the combined total for adjacent lands; the number is estimated at over 1,000, but no exact computations are possible on account of numerous detached ice-masses which may or may not rank as glaciers. Practically all of them are now in retreat, though they will long continue to feed all the important rivers and streams of Switzerland. They probably occupy 700 sq m , very unequally distributed; eleven of the cantons possess no glaciers. The greatest area is found in the Valais (more than half of the total area), followed by the Grisons and Berne (about ⅛th each); then by Uri, Glarus and Ticino (the last about 13 sq.m.); the remaining cantons—Unterwalden, Vaud, St Gall, Schwyz and Appenzell have, in aggregate, a glacier area little superior to that of Ticino alone. The longest glacier in the main Alpine chain is the Gorner (9¼ m.), but it is exceeded by the Great Aletsch (16½ m.) and by the Fiescher and the Unteraar (10 m. each) which run down from the high eastern mountains of the Bernese Oberland.

Climate.—In an area such as Switzerland which extends through less than two degrees of latitude, climate will be influenced more particularly by differences of altitude, aspect and gradient; these show wide and surprisingly sudden variations, *e.g.*, Monte Rosa (15,217 ft high) is distant only 30 m. in a "straight" line from Lago Maggiore, with waters in the same latitude, but only 646 ft. in altitude. Great heights are characterized by (i.) low barometer readings: Monte Rosa summit records about half sea-level pressure; hence the possibility of "mountain sickness"; (ii.) usually more brilliant sunshine and dry air, particularly in winter, producing "sun-burning" and "ice-dazzle," which in some subjects amounts to "snow-blindness"; (iii.) much lower temperatures; among the Alps the average fall in temperature is about 1·2° F on the south side and about 0·9° F on the north side for each 330 ft. of ascent. The height of the Alpine crest and its main direction also profoundly influence the winds. In addition to local winds of certain higher levels which show a daily change of direction—down-hill in the morning and up-hill in the evening—there are other characteristic winds which are much less localized in their effects, as the southerly *fohn,* warm, dry and oppressive, which affects considerable areas in east Switzerland, particularly during spring and autumn; and the northerly *bise,* a cold wind experienced in Geneva. Switzerland's many climates are important, not only in Europe's playground generally, but also in the "nests of sanatoria." Hence, climate and weather statistics have been carefully compiled for many stations. The majority of Swiss tours and health resorts guide-books include a selection, but for a logical treatment of the climate details, reference should be made to such works as W. G Kendrew, *Climates of the Continents* (London, 2nd ed 1927).

January is the coldest month, the following averages being recorded: Basle (909 ft. alt.) 31 8° F; Altdorf (1,480 ft. alt.) 32·4° F; Davos (5,121 ft. alt) 18·7° F; St Gotthard (6,877 ft. alt.) 18·1° F; Santis (8,202 ft. alt) 16·2° F, whilst an unusually low average is from Bevers (5,610 ft. alt) with 14·2° F. Precipitation (either rain or melted snow) shows wide variations, *e g*, Basle has 32·5 in. total annual precipitation, Altdorf, 49 0 in ; Davos, 35 7 in. and Santis, 95·7 in. At several stations much of this falls as snow. On Santis the precipitation is as snow from November to April inclusive, and only July and August have more rain than snow. Snow accumulates to a depth of 20 to 25 ft. at Bevers and upwards of 45 ft. on Säntis. July is the hottest month, the average July records in degrees F being: Basle 66 4, Altdorf 64·4, Davos 53 8, St Gotthard 46·2, Santis 41·0, Bevers 53 2, the range at the last station, 39 0°, tending to be extreme. Santis, though cold, is much more equable, 24·8°. The snow line, showing considerable local variations, is about 9,000 ft. high on the western Alps, and about 10,500 ft. in the drier eastern mountains.

Forests.—The entire forest area of Switzerland on Jan. 1, 1924, was 3,803 sq m. (nearly 24% of the whole country), chiefly coniferous (pine, fir and larch), but with considerable patches of oak, beech and maple on the lower lands. This total represents a considerable increase in recent years largely dependent on: (*a*) confederation-controlled re-afforestation schemes (in 1925 over 15 million trees [chiefly coniferous] were planted); (*b*) scientific preservation of the woodlands with which the forestry department of the Federal polytechnic school at Zurich is closely associated. The Federal Constitution of 1874 handed over to the confederation the responsibility for the forests "in the high mountains," and in 1876 it was enacted that the public forests should be surveyed, rights of way and of fuel should be legally determined and then surrendered with suitable compensation, the forest areas should never be reduced but increased by new planting schemes, with, if necessary, Federal financial support. Since 1902 the Confederation has oversight of all forests, however owned, within its area. The most extensive forests occur in the five cantons of Berne, Grisons, Vaud, Valais and Ticino.

Area.—The 1923–24 determination gave Switzerland a total area of 15,940 sq.m. Of this, 77·45% are reckoned as "productive," and support the large total of over 212,000 peasant proprietors, chiefly on the grasslands which occupy 53·2% of the *productive* area; about two-thirds of the grassland is pasture. Forests occupy 28·9% of the "productive" area. Of the "unproductive" area, amounting to nearly 3,600 sq.m., the greater part is composed of bare mountain and plateau slope, yet much consists of lakes and rivers, while glaciers cover about 700 sq.m.

Population.—Well-organized census returns were made at ten-

VIEWS OF SWISS CITIES

1. Limat Quai and part of Zurich. This city is the educational capital of Switzerland; the magnificent university buildings are seen in the background

2. Aeroplane photograph of Berne (altitude 6,560 feet), the capital of Switzerland. The heart of the city is encircled by the River Aar which adds considerably to its beauty but raises difficult transport problems

year intervals from 1850 on (except that a census was taken in 1888 and not in 1890). To the nearest ⅛-million, the several totals were as follows, beginning at 1850 and ending at 1920: 2⅜, 2½, 2⅝, 2⅞, 3, 3⅜, 3¾, 3⅞. There has also been a steady increase in density of population from 150 per sq.m. in 1850 through 207 per sq.m. in 1900, to 243 per sq.m. in 1920. The estimated total population on Dec. 1, 1926, was 3,959,000 (248 per sq.m.). The total increase in the second half of the 19th century was 38%, and in the first quarter of the 20th was 23%.

The least densely populated cantons are the Alpine ones, *e.g.*, Grisons (43 per sq.m.), Uri (58); the Jura cantons are much better populated: Vaud (255), Neuchâtel (421), whilst the densest of all the complete cantons are Geneva (1,583) and Zürich (823). The half-canton of Basle-Stadt (10,050, area 14 sq.m.) is an exception. See *Statisches Jahrbuch der Schweiz.*

The *Non-Swiss element* of the population increased from 3% in 1850 to 11·6% in 1900, but fell to 10·4% in 1920; its total increased from 71,570 to 402,385. The Germans are the most numerous; next in order come Italians, French and Austrians.

The *emigration* of Swiss beyond seas was but 1,691 in 1877, though it rose in 1883 to 13,502 (the maximum as yet attained). In 1899 it had fallen to 2,493, but in the five years ending 1926 (inclusive), it has averaged about 5,400, viz., 5,787, 8,006, 4,140, 4,334, 4,947.

Language.—In the languages habitually spoken, Switzerland presents much variety. By the Federal Constitution of 1874, German, French and Italian are recognized as "national languages" for the purposes of debates in the Federal parliament, and for the public notification of Federal laws and decrees. Romansch and Ladin enjoy no such public recognition. These quaint survivals of a "lingua rustica" of the Roman empire are dialectal differences rather than distinctly different languages. They are chiefly spoken in the canton of Grisons (*q.v.*), Ladin in the Engadine, etc., and Romansch in the Bünder Oberland, etc. The literature of this tongue is scanty and the dialects are partly maintained artificially by societies founded for that purpose. Even in the Grisons where one-third of the people speak the language and approximately one-fifth Italian, German predominates, as it does also in 15 other cantons; in the remaining ones, French prevails in Vaud, Neuchâtel, Geneva, Fribourg, and the Valais, and Italian in Ticino. Detailed census returns as to language have revealed a certain amount of shifting. German was spoken by 71·3% of the population in 1880, by 69·8% in 1900 and by 70·9% in 1920; the figures for French are respectively: 21·4, 22 and 21·2%, and for Italian, 5·7, 6·7, 6·1%, while Romansch (and Ladin—not tabulated apart) fell from 1·4 and 1·2 to 1·1%.

Chief Political Divisions.—The political divisions are the communes (of which there are now about 3,000), district (198), and cantons (22). (See GOVERNMENT.) Of the cantons, 19 are undivided. In 1831 the rural districts of Basle revolted against the undemocratic rule of the urban trade guild; the latter were twice defeated in the field before they agreed (in 1833) to the subdivision of the canton into Basle-Stadt and Basle Land. Unterwalden, from before 1291, was divided into Obwalden and Nidwalden, representing two distinct physical divisions in different river valleys. In 1291, Nidwalden accepted alliance with Uri and Schwyz; Obwalden did not join until later. The Reformation led to a division (1597) of Appenzell into the Inner Rhoden, mainly Roman Catholic and pastoral, and Ausser Rhoden, largely Protestant and industrial.

In 1925, 17 towns had an estimated population exceeding 15,000. The populations of the five largest towns, each exceeding 70,000, are as follows, the figure for 1900 being enclosed within brackets: Zürich 210,720 (150,703), Basle 139,560 (109,161), Geneva 126,000 (104,796), Berne 107,960 (64,227), Lausanne 74,250 (46,732). These towns occupied the same order in 1900, but in 1850 Geneva was the largest town.

The loftiest inhabited village is Juf (*c.* 6,900 ft.) at the head of the Avers valley, near the Septimer pass into the upper Engadine; the lowest settlement is Ascona (666 ft.) on the delta of Val Maggia (Lago Maggiore).

Government.—The administration of the Swiss confederation is quite distinct from that of the 22 constituent cantons, which have individual government as sovereign states, though in several directions they have voluntarily surrendered their rights to the Federal Government. The cantons are built up of two main types of communes, or *gemeinden.* These are the real units.

The *burgher communes* (*communes bourgeoises* or *bürgergemeinden*) are now principally of historical interest, having for the most part been gradually absorbed by the second class of communes. Initially they were groupings of the people to manage the "lands subject to common user" (mainly summer pastures and forests). Later, by purchase or otherwise, the burghers became possessors of manorial rights. But when the Federal diet imposed the care of the poor on the several communes (1551) these naturally aided only their own burgher members. Thus, all non-burgher "settlers," were excluded from any share in the enjoyment of the "common lands," or in their management, though they paid local rates. Increased communication facilities, together with a shifting industrial population, made such restrictions invidious and unfair, particularly after the introduction, under the Helvetic republic (1798–1802) of a Federal citizenship, superior to cantonal citizenship. Later, the increase of communal public duties meant financial obligations exceeding the sums produced by the "common lands." To avoid some of these inconveniences, *political communes* (*municipalités* or *einwohnergemeinden*) were set up. The duties of these communes were largely increased after the liberal movement of 1830; the care of the highways, the police, the schools, the administration of the poor law being successively handed over to them. Swiss citizens belonging to cantons other than those in which they resided were, by the Federal Constitution of 1848, given rights of voting there in cantonal and Federal matters, but not in those relating exclusively to the commune itself, but the Federal Constitution of 1874 gave to permanent Swiss settlers communal voting rights, subject to three months' residence.

In most cantons a number of communes are grouped together to form a district (*amtsbezirke*) under a prefect who represents the cantonal government. Minor communes are controlled by a small council. In the larger communes an executive council is chosen by a general assembly of all male Swiss citizens over 20 years of age, of good conduct and with three months' communal residence. A *maire* (*gemeindepräsident*) is elected by the larger body to preside over the council which has the management of all local affairs, including the carrying out of cantonal and Federal laws or decrees, save and except matters relating to the pastures and forests held in common.

Cantons. (*See* Population.)—Each of the 22 cantons has its own legislature, executive and judiciary. (*See* Justice.) The older cantons have in some instances (Unterwalden, Appenzell and Glarus) preserved their ancient democratic assemblies (*landesgemeinden*), in which all male citizens of full age meet, usually annually during April or May, in the open air for the purpose of legislation and the selection of an annual administrative council. In the remaining cantons the legislature (*grosser Rat* or *grand conseil*) is composed of representatives chosen by universal male suffrage and usually by proportional representation. These councils exercise all the functions of the *landesgemeinden.* The executive also in most of the newer cantons is elected by a popular vote and not as hitherto by the cantonal legislature. All the cantons have the *referendum* and the *popular initiative*, the application of which varies in the different cantons.

Confederation.—On the cessation of the Federal Pact in 1848 a new constitution was accepted by general consent. This is fundamentally the constitution in operation to-day, but sundry revisions were made in 1874, and the 1874 amended constitution is the one now in force. Any subsequent revision can be made by normal Federal legislation with a compulsory *referendum*, on the demand of 50,000 franchised citizens, or by *popular initiative.* Changes require a favourable majority in total votes and total number of cantons. Federal sovereignty is exercised by the legislative Federal assembly (*Bundesversammlung*) and by the executive Federal council (*Bundesrat*), both meeting at Berne. The assem-

bly consists of two chambers—the National Council (*Nationalrat*) and the Council of the States (*Ständerat*). The National Council are chosen in direct election by the enfranchised males; the franchise has not yet been extended to females. The basis of representation is one deputy for each 20,000 total population of the canton, with an additional deputy for any remainder exceeding 10,000. On the 1920 census returns there are thus 198 representatives varying from 34 for Berne and 27 for Zürich to 1 for Uri; 13 of the 22 cantons have less than eight representatives each. The deputies receive attendance pay and travelling expenses from Federal funds, neither allowance is lavish The States Council consists of two members from each canton and one from each half-canton, or 44 in all. The mode of their election, term of membership and rate of pay are entirely cantonal matters and vary accordingly. The average financial allowance is less than for a deputy to the National Council. A general election of representatives takes place every three years, suffrage is universal, voters becoming enfranchised at 20 years of age, and any voter, other than a clergyman, may be elected a deputy Laws passed by the Federal Assembly, though this represents both people and canton, can be vetoed as a result of a majority-supported referendum based on a *popular initiative* demand of 30,000 enfranchised citizens.

The seven members of the Federal Council are elected for three years by the Federal Assembly The following departments are represented: Foreign Affairs, Justice, Interior, Military, Finance, Public Economics, Railways and Post Office. The president of the Confederation holds the foreign portfolio. Both the president of the Confederation and the vice-president of the Federal Council are elected for one year only (Jan. 1–Dec 31) by the Federal Assembly, and cannot be immediately re-elected. Federal councillors cannot hold a plurality of office, either federal or cantonal, and must not engage in any calling or office The salary for each councillor is £1,000 per annum, except in the case of the president, who receives an extra allowance of £80 per annum. The Federal Government (Assembly and Council) is supreme in matters of peace, war and treaties. It regulates the army, railways, posts, mint, national banknote issues, weights and measures of the republic, and is being increasingly entrusted with matters formerly considered to be purely cantonal

Religion.—The Federal Constitution of 1874, while recognizing no established Swiss Church, guarantees full religious liberty and freedom of worship, as well as exemption from any *compulsory* church rates It repeats the Constitution of 1848 in forbidding the settlement of Jesuits and all affiliated religious orders in Switzerland, and extends this prohibition to any other orders that may endanger the safety of the State, or interfere with the peace of other creeds.

The Protestants formed 59·3% of the total population in 1850, 57·8% in 1900 and 57·5% in 1920; the Roman Catholics, 40·6%, 41·6% and 40·9% in these respective years, while the Jews increased from 0·1% to 0·4% and to 0·5% in 1920—the remainder (other religions or none) showed a considerable increase in the 20th century Twelve cantons in 1920 had a majority of Protestants and ten of Catholics

Of the more populous cantons, Zürich, Bern, Vaud, Neuchâtel and Basle are mainly Protestant, while Lucerne, Fribourg, Ticino, Valais and the Forest cantons are principally Catholic Although a Federal Swiss Church is not recognized, any canton may establish one or more Churches (*Landeskirchen*) Practices differ considerably in the several cantons; some have one creed solely established, others have two jointly; Neuchâtel has three established churches (Protestants, Roman Catholics and Christian Catholics), and Geneva, in 1907, disestablished both of her existing Churches. The Roman Catholic priests are much more numerous than the Protestant clergy, and comprise more than 6,000 regular and secular priests under five diocesan bishops—Sion (founded in the 4th century), Geneva and Lausanne (4th and 6th century), Basle (4th century, but reorganized in 1828), Coire (5th century), and St. Gall (a separate see since 1847). There are besides the sees of Lugano (created in 1888 for Italian Switzerland—but now united to the see of Basle), and Bethlehem (a see *in partibus*, annexed in 1840 to the abbacy of St. Maurice in the Valais). The Christian Catholics are a sect split off from the Romanists in 1874 on the question of papal infallibility, and since 1876 have had a bishop of their own who resides in Bern They are strongest in Bern, Soleure and Geneva A few monasteries in Switzerland escaped suppression The principal are the Benedictine houses of Disentis (founded in the 7th century), rebuilt in 1846 and now used as schools; Einsiedeln (10th century), now a great pilgrimage centre. 180,000 yearly; and Engelberg (12th century) now famed also for its cheeses There are also Augustinian houses at St. Maurice (founded in the 4th century—held by Augustinians since 1128) and on the Great St. Bernard (11th century). The government of the Protestant Church is Calvinistic.

Justice.—Each canton elects, controls and pays (often merely a nominal sum, even if the posts are not entirely honorary) its own magistracy for ordinary civil and criminal trials There are cantonal variations in the penal code, *e g*, capital punishment exists only in nine cantons and one half-canton

The *Federal Supreme Court* (*Bundesgericht*) sits at Lausanne There are 24 full members (plus nine supplementary judges), elected by the Federal Assembly to hold office for six years with eligibility for re-election The Federal Assembly also elects every two years the president and vice-president who, as such, cannot be re-elected The original and final jurisdiction of the *Bundesgericht* extends to disputes between the confederation, the cantons, corporations, and private individuals, so far as these differences refer to Federal matters, and involve more than 3,000 fr in dispute, in financial suits It is a court of appeal against cantonal authorities in the application of Federal laws, and also against decisions of other Federal departments It is a court of trial for persons accused of treason, or other offences against the confederation The four courts of the *Bundesgericht* are: Court of Accusation, Criminal Court (with paid jurors elected by the people), Federal Penal Court, Court of Cassation.

Federal Finances, Post Office, Bank.—Before 1848 there was no strong Federal authority, and Federal finances were almost unknown. The subsequent increase in power of the confederation is shown by the annual balance sheet. In 1849 the receipts were nearly £240,000, as against an expenditure of £260,000 By 1873 the amount on each side exceeded 1½ million pounds; in 1883, two million pounds; in 1900, four millions In 1928 revenue was estimated at £12,889,200 and expenditure at £13,260,000 An "adverse" figure has been a feature of recent budgets. The floating debt (Jan. 1, 1926) was slightly in excess of £4,000,000.

By the Federal Constitution of 1848 the *post office* was made a Federal responsibility, and a Federal law of 1851 extended this to the electric telegraph. In the 1874 constitution, both branches remained within the jurisdiction of the confederation, while in 1878, this control extended to the telephone service.

In 1891 the principle of a *State bank* with a monopoly of note issue was accepted. A first scheme was rejected by a popular vote in 1897, but a second was successful in 1905. The "Swiss National Bank" was opened on June 20, 1907, with its headquarters divided between Zürich and Berne. On March 7, 1928, it had, as main items, nearly 796 million fr. in circulation as notes as against 432½ million fr. in bullion (gold and silver), and over 315 million fr. in bills; the lowest denomination for a national banknote is five francs. The current and deposit accounts amounted to nearly 92 million francs. Since April 1, 1927, gold currencies of other countries of the former Latin Monetary Union (dissolved in 1926) have ceased to be legal tender in Switzerland. (W. A. B. C.; W. E. Wh.)

DEFENCE

Historical.—The inhabitants of Switzerland were always a hardy and independent race, but their high military reputation dates from the middle of the 15th century, when the comparatively ill-armed and untrained mountaineers signally defeated Charles the Bold of Burgundy and the flower of the chivalry of Europe in the battles of Granson, Morat and Nancy (*q.v.*; *see* also Swiss

WARS). The wealthier countries vied with each other in hiring them as mercenaries, and the poor but warlike Swiss found the profession of arms a lucrative one. (*See* ARMY.)

Their fall was due in the end to their own indiscipline in the first place, and the rise of the Spanish standing army and its musketeers in the second.

Present-day Army.—Being composed of militia, the Swiss Army contains no forces maintained permanently with the colours with the exception of a corps of instructors, a system which has been followed in some of the self-governing nations of the British Empire and in several of the smaller European nations.

Recruitment and Service.—All male citizens are liable to military service from the year in which their 20th birthday falls until the year of their 48th birthday. Service may either be rendered personally, or by the payment of a military tax. Volunteering before the legal age is permitted. The military tax is payable up to the age of 40. Enlistment takes place in the year of the 19th birthday. Personal service includes attendance for training, active service at home or abroad in defence of the country, and maintenance of public order and security. Men passed fit for auxiliary service pay a tax in lieu of military training for the years in which it would otherwise be performed. After physical training for boys, provided by the cantons under the supervision of the Federal Government, the training is carried out under the military department. After a recruit course of 65 days for infantry and engineers, 90 days for cavalry, 75 days for artillery, air force and fortress troops, and 60 days for departmental troops, members of the active army undergo annual training for 11 to 14 days for 10 years for sergeants and above and for 7 to 8 years below that rank. Men in the landwehr do 11 days training every 4 years, but corporals and privates are only called up for one repetition training. There are also compulsory musketry courses, performed in rifle clubs. Officers are trained in cadet schools for 45 to 80 days according to arm of the service. There are special courses up to the rank of captain, lasting for 30 to 50 days, and, after attaining that rank three courses lasting 60, 42, and 21 days respectively for training general staff officers.

Strength and Organization.—The budget effectives (1927) provide a permanent training staff of 267. The training cadres number 7,578 employed on an average of 32 days in a year; 24,780 recruits undergo courses varying from 62 to 92 days, and 126,059 undergo 13 to 16 days refresher courses. There must also be taken into account the preliminary training:—24,000 men undergoing physical training, 8,000 training with arms, 13,000 undergoing junior musketry training, and 3,000 in the cadet corps. About 240,000 do compulsory and 160,000 optional training in the rifle clubs. Account must also be taken of the military police, which is under the commander-in-chief of the army and free from cantonal laws when acting with the troops.

The army, which consists of a first line (*élite*) for ages from 20 to 32 inclusive, landwehr for ages from 33 to 40 inclusive, and landsturm for ages from 41 to 48 inclusive, has since July 1925 been organized in 6 divisions and army troops. The 1st, 3rd, 5th and 6th divisions each contain one mountain brigade. The 2nd and 4th divisions contain no mountain troops. The composition of a division calls for no special comment except for the presence therein of cyclist companies, machine-gun companies and 4 motor transport columns. A mountain brigade contains 6 battalions of first-line mountain infantry, and 3 of landwehr mountain infantry, 2 mountain batteries, 1 company of mountain engineers and the usual auxiliary services, all equipped for mountain warfare. The mobile artillery in the army troops is tractor-drawn.

Higher Command.—The Federal Council is the supreme head. One of the federal councillors is head of the military department, the central authority in peace time for dealing with military questions. If a levy of troops is ordered on a large scale the federal assembly appoints a commander-in-chief of the army. There is a general staff under the military department and a national defence committee, with the head of the military department as chairman and the chief of the general staff, 3 army corps commanders and the officer commanding infantry as members. The committee ceases to function when a commander-in-chief is appointed. Switzerland is divided territorially into 8 military areas with headquarters at I. Lausanne, II. Bienne, III. Berne, IV. Aarau, V. Zürich, VI. Bellinzona, VII. Altdorf, VIII. Coire, for organizing the territorial services in time of war. The territory is also divided into 6 divisional military districts with headquarters at I. Morges, II. Fribourg, III. Berne, IV. Aarau, V. Zürich, and VI. St. Gallen. Under the above-mentioned 3 Army-Corps Commands the troops in the divisional areas are grouped as follows:—First Corps, the 1st and 2nd divisions, St. Maurice garrison and army troops; second corps, the 3rd and 4th divisions and army troops; third corps, the 5th and 6th divisions, St. Gothard garrison and army troops. There is a Central Military School, officer schools and courses for the different arms and for non-commissioned officers. There are permanent works at St. Maurice and St. Gothard. The annual budget shows an expenditure of about 2,000,000 francs on forts and fortifications.

Military Air Force.—There is a military air service under the general staff. Its commander is called chief of the military air service. The provisional organization of the air service is in 3 "flying groups" composed, in detail, of 10 "flights" forming 15 companies, pilots corps, corps of observers, 3 photographic sections and 1 air park company. The number of companies in a "flight" is not definitely prescribed. The companies of various types number 40 in all (30 first-line, 5 mixed and 5 *landwehr*). Pilot officers, after at least 24 months continuous training, become "monthly pilots" and do 100 hours flying per annum, usually spread over 10 months. Reserve pilots do 50 hours, spread over 5 months. Similar conditions apply to observers. Officers from the other areas can be seconded both to the pilot corps and to the observers corps. The budget effectives for 1927 show 11 on the air training staff, 169 in the training cadres in addition to 246 engaged monthly, 400 in the recruits training course (77 days) and 1,550 in the refresher training courses doing 15 day courses. Taken in all, about 70,000 parade-days were performed in the cadre, recruits and refresher training courses.

(G. G. A.)

ECONOMICS AND TRADE

According to the last Swiss (1920) census, of the total population of 3,880,320 inhabitants, 26·6% were sustained by agriculture, 41·1% by manufactures and mechanical pursuits, 9·9% by trade, 6·7% by transportation, 6·2% by the professions, 3·3% by personal and domestic service and the rest, 6·4%, by incomes drawn from other sources. Although it is not possible from these or from any other available figures to ascertain exactly what proportion of the population of Switzerland drew its livelihood directly and indirectly from the tourist traffic, it is quite obvious that it was very far from being the majority. According to an estimate made in 1912 by the Association of Swiss Hotel Keepers, about 43,000 persons were then occupied in hotels patronized mostly by foreign tourists. As the tourist traffic has not yet completely recovered from the serious depression it underwent during the war and during the post-war crisis, that figure should still be approximately correct. Now, according to the census of 1920, besides nearly 500,000 persons actively engaged in agriculture, over 807,000 were engaged in manufacturing pursuits—224,000 in mechanical trades, 68,000 in watch making, 48,000 in other metal trades and 143,000 in textile factories.

Manufactures.—As a matter of fact, Switzerland is one of the most highly industrialized States of Europe. Only Great Britain and Belgium have a relatively greater industrial population.

The table on p. 680, indicating the number of persons occupied in 1910 and 1920, the annual export values for 1913 and 1927 and the triennial average export values for 1911–13 and 1925–7 may give some idea of the size and of the development of the most important Swiss manufactures.

The figures relating to persons employed are taken from the decennial census returns and those relating to exports from the annual trade statistics. Although they do not refer to the same period, nor even to exactly the same manufactures, they may

Principal Exporting Industries

Industry	Number of persons employed (000's omitted)		Value of annual exports (000,000's of Swiss francs omitted)							
	1910	1920	1911	1912	1913	Av 1911 1913	1925	1926	1927	Av 1925 1927
Watch making	53	63	164	174	183	174	302	258	273	278
Silk weaving	24	20	104	111	107	107	209	187	202	199
Machine making	52	80	83	91	98	91	183	164	180	176
Chemical	6	13	50	55	58	54	111	119	137	122

Cotton weaving	19	19	36	38	37	37	123	96	107	109
Cotton spinning	13	13	17	17	17	17	71	46	58	58
Aluminium	1 1	2 4	7	14	13	11	52	55	54	54
Condensed milk	1 6	2 2	39	47	44	43	41	41	44	42
Boot and shoe	24	26	11	14	19	14	34	36	38	36
Artificial silk	0 7	1 8	4	5	5	5	30	34	36	33
Chocolate	6	8·7	47	55	58	53	35	30	33	33

suffice to illustrate several of the main characteristics of industrial Switzerland. Of these characteristics the following two may be especially noted.

In the first place, it is extremely striking that none of the principal Swiss manufactured exports except condensed milk, and, to some extent, boots and shoes are drawn from Swiss raw materials, nor, with the exception of aluminium, are any of them produced mainly with the aid of hydraulic power, the only natural source of energy to be found in the country Switzerland possesses no mineral resources worth mentioning and her soil is singularly poor in industrial products As her manufactures are, besides, deprived of the advantage of an important home market and of direct and cheap access to the sea, their remarkable development can be explained only by the individual enterprise and ability of her population, the stability of her external and internal political position and the abundance and consequent cheapness of her capital resources

The second point illustrated by the above figures is the very unequal development of the various national industries in the course of the last 15 years If we allow for the depreciation of the monetary standard which, although based on gold both before the war and to-day, has lost about ⅓ of its pre-war value, we will note that the watch making, condensed milk and chocolate industries have lost some ground since 1913 and that the embroidery trade, a victim of feminine caprice, has been seriously crippled The same is true, and for the same reasons, of the formerly very prosperous silk ribbon industry. The other main exporting manufactures of Switzerland have prospered in spite of unfavourable economic conditions.

Agriculture.—The mountainous character of the larger part of Switzerland, the high average altitude, the over-abundance of rain and the prevailing system of small holdings all combine to prevent Switzerland from being a preponderantly agricultural country.

For the last 70 years at least, the rural population has been steadily decreasing in relative importance The war and the agrarian protectionist tendencies which have asserted themselves since, have, it is true, prevented its absolute decline in the course of the last years In spite of these retarding factors, however, its relative decline persists as the following figures show:

Agricultural population Number of persons engaged in agricultural pursuits (000's omitted)			Percentage of total professional population		
1900	1910	1920	1900	1910	1920
			%	%	%
473	469	474	32·2	27·5	26·6

For over a century, Switzerland has been becoming increasingly dependent upon imports for her food supply, especially for her bread stuffs This has led to increased agrarian protection, the results of which are shown in the following table:

Imports of Cereal Foodstuffs and of Cattle for Slaughter

	1911	1912	1913	Average 1911–13	1925	1926	1927	Average 1925–27
Wheat*	4393	4856	5292	4847	4084	4384	4526	4331
Other cereals*	3538	3573	3639	3583	3770	3475	4071	3772
Flour, etc.*	820	790	714	772	120	87	71	93
Cattle for slaughter†	84	97	83	88	42	27	16	28

*In thousands of metric quintals. †In thousands of heads

As Switzerland does not export any appreciable quantity of cereal foodstuffs, these figures show that she remains to-day, as she was before the war, essentially dependent upon foreign grain for the sustenance of her population. But they also show that she has not become increasingly so. Under the State import monopoly, under which a super-price is paid to domestic producers out of the gross profits made by the sale of wheat, the price of bread has been affected Under the system which is to be substituted for the import monopoly in 1929, this super-price will be paid out of the proceeds of a general, so-called statistical fee levied on all imports

In the limitation of imports of cattle for slaughter, instead of a State monopoly, a policy has been adopted which, both by increased customs duties on cattle and meat and especially by the quantitative rationing of imports according to prices, domestic cattle raising and fattening have been artificially encouraged.

International Trade.—In spite of these tendencies, the international trade of Switzerland, although adversely affected by the war, has since almost regained its pre-war importance The following table shows the general trend of its recent evolution.

	1911	1912	1913	Av 1911 1913	1925	1926	1927	Av 1925 1927

All figures in this table, except percentages, refer to millions of Swiss francs.

Since the pre-war period, the total foreign trade of Switzerland has appreciably increased in total monetary value, but the ratio of this nominal increase is slightly less than that of the concomitant depreciation of the franc. In other words, the total trade has not yet in real value, that is in the volume of goods exchanged, completely recovered from the crisis of the war. This is illustrated also by the following figures roughly showing, in thousands of metric tons, the relative importance of Swiss imports and exports in 1913 and 1927.

Volume of Trade

	Imports		Exports	
	1913	1927	1913	1927
Raw materials	57	51	4,8	4,7
Manufactured products .	5,6	5,7	2,3	2,2
Foodstuffs	15	13	1,4	1,4
Total	77,6	69,7	8,5	8,3

It will be noticed further that in real values as in volume, exports have diminished less than imports, thus rendering the Swiss balance of trade a little less unfavourable—to use this convenient but fallacious expression—than it was before the war. It should not be assumed, however, that this change in the balance of trade, indicated by the relative excess of import over export values in the two periods considered, has necessarily modified the balance of payments. Compared with the years before the war, the amount of interest derived from foreign investments has doubtless decreased, whereas the sums annually invested abroad have probably never been greater than in the course of the last few years. The abundance and cheapness of money in Switzerland has led to a great and continuous exportation of capital, mainly to neighbouring countries. This process, which has placed Basle, Geneva and especially Zürich in the first rank of continental money markets, is one of the most striking economic phenomena of recent times. Although of course still preponderant, Europe's position in the foreign trade of Switzerland has been weakened in favour of America. This is particularly so as regards the imports to Switzerland, more than 85% of which came from Europe before the war, whereas to-day the proportion is less than 75% and seems to be diminishing from year to year.

Great Britain was always one of Switzerland's best customers before the war. She usually occupied the second position, immediately after Germany. Since the war, and until 1926, she had moved up to the first place. In 1927, however, Germany had again bought more Swiss goods than Great Britain.

The birth and death rates are continuously falling and in 1928 reached one of the lowest levels in Europe. The urban and industrial population are increasing more rapidly than the rural and agricultural, so that Switzerland is becoming ever more highly industrialized. (W. E. R.)

HISTORY

The Swiss Confederation is made up of 22 small States, differing from each other in nearly every point—religious, political, social, industrial, physical and linguistic; yet it forms a nation the patriotism of whose members is universally acknowledged. History alone can supply us with the key to this puzzle; but Swiss history is very intricate and very local. A firm hold on a few guiding principles is therefore most desirable, and of these there are three which we must always bear in mind. (1) The first is *the connection of Swiss history with that of the Empire.* Swiss history is largely the history of the drawing together of bits of each of the imperial kingdoms (Germany, Italy and Burgundy) for common defence against a common foe—the Habsburgs; and, when this family have secured to themselves the permanent possession of the empire, the Swiss League little by little wins its independence of the empire, practically in 1499, formally in 1648. (2) The second is *the German origin and nature of the Confederation.* Round a German nucleus (the three Forest districts) there gradually gather other German districts; and it is not till 1803 and 1815 that its French- and Italian-speaking "subjects" are raised to political equality with their former masters. (3) Swiss history is *a study in federalism.* Based on the defensive alliances of 1291 and 1315 between the three Forest districts, the Confederation is enlarged by the admission of other districts and towns, all leagued with the original three members, but not necessarily with each other. Hence great difficulties are encountered in looking after common interests; the Diet was merely an assembly of ambassadors with powers very strictly limited by their instructions, and there was no central executive authority. The whole constitutional history of the Confederation is summed up in its transition to a federal State, which, while a single State in its foreign relations, in home matters maintains the more or less absolute independence of its members.

Early History of the Three Lands.—On Aug. 1, 1291, the men of the valley of Uri, the free community of the valley of Schwyz, and the association of the men of the lower valley or Nidwalden—Obwalden or the upper valley is not mentioned in the text, though it is named on the seal appended—formed an Everlasting League for the purpose of self-defence against all who should attack or trouble them, a league which is expressly stated to be a confirmation of a former one. This league was the foundation of the Swiss Confederation.

The legal and political conditions of each district were very different. (*a*) In 853 Louis the German granted all his lands in the *pagellus Uraniae* to the convent of Sts. Felix and Regula in Zürich (the present Fraumünster), and exempted them from all jurisdiction save that of the king (*Reichsfreiheit*), so that though locally within the Zürichgau they were not subject to its count, the king's deputy. The abbey thus became possessed of the greater part of the valley of the Reuss between the present Devil's Bridge and the Lake of Lucerne, for the upper valley (Urseren) belonged at that time to the abbey of Disentis in the Rhine valley, and did not become permanently allied with Uri till 1410. The privileged position of the abbey tenants gradually led the other men of the valley to "commend" themselves to the abbey. The important post of "protector" (*advocatus* or *vogt*) of the abbey was given to one family after another by the emperor; but when, in 1218, the office was granted to the Habsburgs, the protests of the abbey tenants led to its withdrawal in 1231, the valley thenceforward depending immediately on the king. (*b*) In Schwyz (first mentioned in 972) we must distinguish between the districts west and east of Steinen. In the former the land was in the hands of many nobles, amongst whom were the Habsburgs; in the latter there was, at the foot of the Mythen, a self-governing community of free men; both, however, were politically subject to the king's delegates, the counts of the Zürichgau, who after 1173 were the ever-advancing Habsburgs. But in 1240 the free community of Schwyz obtained from the emperor Frederick II. a charter which removed them from the jurisdiction of the counts, placing them in immediate dependence on the king, like the abbey men of Uri. In a few years, however, the Habsburgs contrived to dispense with this charter in practice. (*c*) In Unterwalden things were very different. The upper valley (Obwalden or Sarnen), like the lower (Nidwalden or Stans), formed part of the Zürichgau, while in both the soil was owned by many ecclesiastical and lay lords, among them being the Habsburgs and the Alsatian abbey of Murbach. Hence in this district there were privileged tenants, but no free community, and no centre of unity, and this explains why Obwalden and Nidwalden won their way upwards so much more slowly than their neighbours in Uri and Schwyz.

The League of 1291.—The Habsburgs had been steadily rising for many years from the position of an unimportant family in the Aargau to that of a powerful clan of large landed proprietors in Swabia and Alsace, and had attained a certain political importance as counts of the Zürichgau and Aargau. In one or both qualities the cadet or Laufenburg line, to which the family estates in the Forest districts round the Lake of Lucerne had fallen on the division of the inheritance in 1232, seem to have exercised their legal rights in a harsh manner. In 1240 the free men of Schwyz obtained protection from the emperor. It was natural that when, after the excommunication and deposition of Frederick II. by Innocent IV. in 1245, the head of the cadet line of Habsburg sided with the pope, some of the men of the Forest districts should rally round

the emperor Schwyz joined Sarnen and Lucerne (though Uri and Obwalden supported the pope); and in 1247 the men of Schwyz, Sarnen and Lucerne were threatened by the pope with excommunication if they persisted in upholding the emperor and defying their hereditary lords the counts of Habsburg The rapid decline of Frederick's cause soon enabled the Habsburgs to regain their authority in these districts. These incidents are the only foundation in fact of the legendary stories of Habsburg oppression told of and by a later age After this temporary check the power of the Habsburgs continued to increase rapidly In 1273 the head of the cadet line sold all his lands and rights in the Forest districts to the head of the elder or Alsatian line, Rudolph, who a few months later was elected emperor He recognized the privileges of Uri but not those of Schwyz; and, as he now united in his own person the characters of emperor, count of the Zurichgau, and landowner in the Forest districts, such a union of offices might be expected to result in a confusion of rights On April 16, 1291, Rudolph bought from the abbey of Murbach in Alsace (of which he was "advocate") all its rights over the town of Lucerne and the abbey estates in Unterwalden It thus seemed probable that the other Forest districts would be shut off from their natural means of communication with the outer world by way of the lake Rudolph's death, on July 15 of the same year, cleared the way, and a fortnight later (Aug 1) the Everlasting League was made between the men of Uri, Schwyz and Nidwalden for the purpose of self-defence against a common foe

Morgarten and the League of 1315.—In the struggle for the empire, which extended over the years following the conclusion of the League of 1291, we find that the Confederates supported without exception the anti-Habsburg candidate On Oct 16, 1291 Uri and Schwyz allied themselves with Zurich, and joined the general rising in Swabia against Albert, the new head of the house of Habsburg It soon failed, but hopes revived when in 1292 Adolf of Nassau was chosen emperor In 1297 he confirmed to the free men of Schwyz their charter of 1240, and, strangely enough, confirmed the same charter to Uri, instead of their own of 1231. It is in his reign that we have the first recorded meeting of the *Landsgemeinde* (or legislative assembly) of Schwyz (1294) But in 1298 Albert of Habsburg himself was elected to the empire His rule was strict and severe, though not oppressive He did not indeed confirm the charters of Uri or of Schwyz, but he did not attack the ancient rights of the former, and in the latter he exercised his rights as a landowner and did not abuse his political rights as emperor or as count In Unterwalden we find that in 1304 the two valleys were joined together under a common administrator (the local deputy of the count)—a great step forward to permanent union The stories of Albert's tyranny in the Forest districts are not heard of till two centuries later His successor, Henry of Luxemburg, confirmed, on June 3, 1309, to Uri and Schwyz their charters of 1297, and, for some unknown reason, confirmed to Unterwalden all the liberties granted by his predecessor, though as a matter of fact none had been granted This charter, and the nomination of one royal bailiff to administer the three districts, had the effect of placing them all in an identical political position, and that the most privileged yet given to any of them—the freedom of the free community of Schwyz A few days later the Confederates made a fresh treaty of alliance with Zurich; and in 1310 the emperor placed certain other inhabitants of Schwyz on the same privileged footing as the free community. Although Henry granted the request of the Habsburgs for an inquiry into their precise rights in Alsace and in the Forest districts, no steps were taken to carry out this investigation.

On Henry's death in 1313 the men of Schwyz seized the opportunity for making a wanton attack on the great abbey of Einsiedeln, with which they had a long-standing quarrel as to rights of pasture. The abbot caused them to be excommunicated and Frederick of Habsburg (the choice of the minority of the electors), who was the hereditary "advocate" of the abbey, placed them under the ban of the empire. His rival, Louis of Bavaria, to whom they appealed, removed the ban; on which Frederick issued a decree by which he restored to his family all their rights and possessions in *the three valleys* and Urseren, and charged his brother Leopold with the execution of this order. The Confederates hastily concluded alliances with Glarus, Urseren, Arth and Interlaken to protect themselves from attack on every side. Leopold collected a brilliant army at the Austrian town of Zug in order to attack Schwyz, while a body of troops was to take Unterwalden in the rear by way of the Brunig Pass. On Nov. 15, 1315, Leopold moved forward along the shore of the Lake of Aegeri, intending to assail the town of Schwyz by climbing the slopes of Morgarten above the south-eastern end of the lake There they were awaited by the valiant band of the Confederates who utterly defeated them Leopold fled in hot haste to Winterthur, and the attack by the Brunig was driven back by the men of Unterwalden On Dec 9, 1315 representatives of the victorious highlanders met at Brunnen, on the Lake of Lucerne and renewed the Everlasting League of 1291 In their main lines the two documents are very similar, the later being chiefly an expansion of the earlier. That of 1315 is in German (in contrast to the 1291 League, which is in Latin), and has one or two striking clauses largely indebted to a decree issued by Zürich on July 24, 1291 None of the three districts or their dependents is to recognize a new lord without the consent and counsel of the rest. Strict obedience in all lawful matters is to be rendered to the rightful lord in each case, unless he attacks or wrongs any of the Confederates, in which case they are to be free from all obligations No negotiations, so long as the "Länder" have no lord, are to be entered on with outside powers, save by common agreement of all Louis solemnly recognized and confirmed the new league in 1316, and in 1318 a truce was concluded between the Confederates and the Habsburgs, who treat with them on equal terms The lands and rights annexed belonging to the Habsburgs in the Forest districts are fully recognized as they existed in the days of Henry of Luxemburg, and freedom of commerce is granted. But there is not one word about the *political* rights of the Habsburgs as counts of the Zürichgau and Aargau.

The League of Eight Members.—As early as 1320 we find the name "Switzerland" (*Sweicz*) (derived from Schwyz, which had always been the leader in the struggle) applied to the three Forest cantons, and in 1352 extended to the Confederation as a whole But it was not till after Sempach (1386) that it came into popular use, and it did not form the official name of the Confederation till 1803. This is in itself a proof of the great renown which the League won by its victory at Morgarten Another is that as years go by we find other members admitted to the privileges of the original alliance of the three Forest districts First to join the League (1332) was the neighbouring town of Lucerne, which had grown up round the monastery of St Leodegar or Leger (whence the place took its name), a cell of the great house of Murbach in Alsace, and had been sold to the Habsburgs in 1291. Its accession brought a new element into the pastoral association of the Forest districts, which now surrounded the entire Lake of Lucerne Next, in 1351, came the ancient town of Zürich, through a civic revolution, in which the leader of the democratic party allied the town with the League In this way the League now advanced from the hilly country to the plains, though the terms of the treaty with Zürich did not bind it so closely to the Confederates as in the other cases, and hence rendered it possible for Zürich now and again to incline towards Austria in a fashion which did great hurt to its allies In 1352 the League was enlarged by the admission of Glarus and Zug Glarus belonged to the monastery of Säckingen on the Rhine, of which the Habsburgs were "advocates," claiming therefore many rights over the valley, which refused to admit them, and joyfully received the Confederates who came to its aid; but it was placed on a lower footing than the other members of the League, being bound to obey their orders Three weeks later the town and district of Zug, attacked by the League and abandoned by their Habsburg masters, joined the Confederation, forming a transition link between its civic and rural members. The immediate occasion of the union of these two districts was the war begun by the Austrian duke against Zürich, which was ended by the peace of 1352, by which Glarus and Zug were to be restored to the Habsburgs, who also regained their rights over Lucerne. Zug was won for good by a bold stroke of the men of Schwyz in 1364, but it was not till the day of Näfels (1388) that Glarus recovered its lost

freedom. These temporary losses were, however, far outweighed by the entrance into the League in 1353 of the famous town of Berne, founded in 1191 by Berthold V. of Zäringen, which had become a free imperial city in 1218 on the extinction of the Zäringen dynasty, and made a treaty with the Forest districts as early as 1323. In 1352 she had been forced to take part in the war against Zürich, but soon after the conclusion of peace entered the League as the ally of the three Forest districts, being thus only indirectly joined to Lucerne and Zürich. The special importance of the accession of Bern was that the League now began to spread to the west, and was thus brought into connection for the first time with the French-speaking land of Savoy. The League thus numbered eight members, the fruits of Morgarten, and no further members were admitted till 1481, after the Burgundian War. But, in order thoroughly to understand the nature of the League, it must be remembered that, while each of the five new members was allied with the original nucleus—the three Forest districts—these five were not directly allied to one another.

Sempach.—After a short interval of peace the quarrels with Austria broke out afresh. Lucerne fretted much under the Austrian rule, received many Austrian subjects among her citizens, and refused to pay custom duties to the Austrian bailiff at Rothenburg, on the ground that she had the right of free traffic. An attack on the custom-house at Rothenburg, and the gift of the privileges of burghership to the discontented inhabitants of the little town of Sempach a short way off, so irritated Leopold III. (who then held all the possessions of his house outside Austria) that he collected an army, with the intention of crushing his rebellious town. Lucerne meanwhile had summoned the other members of the League to her aid, and, approximately 1,600 men of Uri, Schwyz, Unterwalden and Lucerne opposed the 6,000 which made up the Austrian army. The decisive fight took place on July 9, 1386, near Sempach. Leopold, with a large number of his followers, was slain, and the Habsburg power within the borders of the Confederation finally broken. Glarus at once rose in arms, but it was not till the expiration of the truce made after Sempach that Leopold's brother, Albert of Austria, brought an army against Glarus, and was defeated at Näfels (not far from Glarus) on April 9, 1388, by a handful of Glarus and Schwyz men.

In 1389 a peace for seven years was made, the Confederates being secured in all their conquests; and on July 16, 1394, the peace was prolonged for 20 years (and again in 1412 for 50 years), various stipulations being made by which the long struggle of the League against the Habsburgs was finally crowned with success. By the peace of 1394 Glarus was freed on payment of £200 annually; Zug too was released from Habsburg rule. Schwyz was given the *advocatia* of the great abbey of Einsiedeln; Lucerne got the Entlebuch (finally in 1405), Sempach and Rothenburg; Bern and Soleure were confirmed in their conquests. Above all, the Confederation as a whole was relieved from the overlordship of the Habsburgs, to whom, however, all their rights and dues as landed proprietors were expressly reserved, Bern, Zürich and Soleure guaranteeing the maintenance of these rights and dues with power in case of need to call on the other Confederates to support them by arms. Though the house of Habsburg entertained hopes of recovering its former rights, so that technically the treaties of 1389, 1394 and 1412 were but truces, it finally and forever renounced all its feudal rights and privileges within the Confederation by the "Everlasting Compact" of 1474.

The victory at Sempach enabled the League to extend both its influence and its territory. Both the League and its individual members were now able to take the offensive. In the 15th century each member increased and rounded off its territory, though it usually withheld political rights from the men of the newly acquired lands. It was in the same century that Appenzell, St. Gall and the Upper Valais first became associated with the League, though they did not become full members for a long time—Appenzell in 1513, St. Gall in 1803, the Valais in 1815. Above all, the 15th century saw the first attempt of the Confederation to secure a footing south of the Alps.

In 1412 the treaty of 1394 between the League and the Habsburgs had been renewed for 50 years; but when in 1415 the emperor Sigismund placed Duke Frederick of Austria under the ban of the empire (*see* CONSTANCE), the League hesitated, because of their treaty of 1412, till the emperor declared that this treaty did not release them from their obligations to the empire. In the name, therefore, of the emperor, and by his special command, the different members of the League overran the extensive Habsburg possessions in the Aargau. The chief share fell to Bern, but certain districts (known as the *Freie Aemter*) were joined together and governed as bailiwicks held in common by all the members of the League (save Uri, busied in the south, and Bern, who had already secured the lion's share of the spoil for herself). This is the first case in which the League as a whole took up the position of rulers over districts which, though guaranteed in the enjoyment of their old rights, were nevertheless politically unfree.

First Italian Conquests.—As the natural policy of Bern was to seek to enlarge its borders at the expense of Austria, and later of Savoy, so we find that Uri, shut off by physical causes from extension in other directions, as steadily turned its eyes towards the south. In 1410 the valley of Urseren was finally joined to Uri, an acquisition which gave to Uri complete command over the St. Gotthard pass, long commercially important, and now to serve for purposes of war and conquest. Already in 1403 Uri and Obwalden had occupied the long narrow upper Ticino valley on the south of the pass called the Val Leventina; in 1411 the men of the same two lands, exasperated by the insults of the local lords, called on the other members of the League, and all jointly (except Bern) occupied the Val d'Ossola, on the south side of the Simplon pass. But in 1414 they lost this to Savoy, and, with the object of getting it back, obtained in 1416–17 the alliance of the men of the Upper Valais, then fighting for freedom, and thus regained the valley (1416). In 1419 Uri and Obwalden bought from its lord the town and district of Bellinzona. This rapid advance, however, did not approve itself to the duke of Milan; the Confederates were not at one with regard to these southern conquests; the duke of Milan intrigued with them, and finally in 1426, by a payment of a large sum of money and the grant of certain commercial privileges, the Val Leventina, the Val d'Ossola and Bellinzona were formally restored to him.

The First Civil War.—The original contrasts between the social condition of the different members of the League became more marked when the period of conquest began, and led to quarrels and ill-feeling in the matter of the Aargau and the Italian conquests which a few years later ripened into a civil war, brought about by the dispute as to the succession to the lands of Frederick, count of Toggenburg, the last male representative of his house. Count Frederick's predecessors had greatly extended their domains, so that they took in not only the Toggenburg or upper valley of the Thur, but Uznach, Sargans, the Rhine valley between Feldkirch and Sargans, the Prättigau and the Davos valley. He himself, the last great feudal lord on the left bank of the Rhine, had managed to secure his vast possessions by making treaties with several members of the League. His death (April 30, 1436) was the signal for the breaking out of strife. The Prättigau and Davos valley formed the League of the Ten Jurisdictions in Raetia, while Frederick's widow took sides with Zürich against Schwyz for different portions of the great inheritance which had been promised them. After being twice defeated, Zürich was forced in 1440 to buy peace by certain cessions to Schwyz, the general feeling of the Confederates being opposed to Zürich, so that several of them went so far as to send men and arms to Schwyz. Zürich, however, was bitterly disappointed at these defeats, and had recourse to the policy which she had adopted in 1356 and 1393—an alliance with Austria (concluded in 1442), which now held the imperial throne in the person of Frederick III. Though technically within her rights according to the terms on which she had joined the League in 1351, this act of Zürich caused the greatest irritation in the Confederation, and civil war at once broke out. In 1443 the Zürich troops were completely defeated at St. Jakob on the Sihl, close under the walls of the city. Next year the city itself was long besieged. Frederick, unable to get help elsewhere, procured from Charles VII. of France the despatch of a body of Armagnac free lances (the Ecorcheurs), who came, 30,000 strong, under the dauphin Louis,

plundering and harrying the land, till at the very gates of the free imperial city of Basle, the desperate resistance of a small body of Confederates (1,200 to 1,500), till cut to pieces, checked the advance of the free booters, who returned whence they had come. Several small engagements ensued, Zürich long declining to make peace because the Confederates required, as the result of a solemn arbitration, the abandonment of the Austrian alliance. At length it was concluded in 1450, the Confederates restoring almost all the lands they had won from Zurich.

Constitution of the League, c. 1450.—These fresh proofs of the valour of the Confederates, and of the growing importance of the League, produced important results. In 1452 they made their first treaty of alliance with France, a connection which was destined to exercise so much influence on their history. Round the League there began to gather a new class of allies, more closely joined to it, or to certain members of it, than by a mere treaty of friendship, yet not admitted to the rank of a full member of the League. Of these associates three, the abbot (1451) and town of St. Gall (1454), and the town of Bienne (Biel), through its alliance (1352) with Berne, were given seats and votes in the Diet, being called *socii;* while others, known as *confoederati,* were not so closely bound to the League, such as the Valais (1416–17), Schaffhausen (1454), Rottweil (1463), Mulhouse (1466), (to the class of *confoederati* belonged in later times Neuchâtel, 1406–1501), the Three Leagues of Raetia (1497–98), Geneva (1519–36), and the bishop of Basle (1579). Appenzell, too, in 1452, rose from the rank of a "protected district" into the class of associates, outside which were certain places "protected" by several members of the League, such as Gersau (1359), the abbey of Engelberg (*c.* 1421), and the town of Rapperswil (1464).

In 1439 Sigismund succeeded his father Frederick in the Habsburg lands in Alsace, the Thurgau, and Tirol and, being much irritated by the constant encroachments of the Confederates, in particular by the loss of Rapperswil (1458), declared war against them, but fared very badly. In 1460 the Confederates overran the Thurgau and occupied Sargans. Winterthur was only saved by an heroic defence Hence in 1461 Sigismund had to give up his claims on those lands and renew the peace for 15 years, while in 1467 he sold Winterthur to Zurich. Thus the whole line of the Rhine was lost to the Habsburgs, who retained (till 1801) in the territories of the Confederates the Frickthal only. The Thurgovian bailiwicks were governed in common as "subject" lands by all the Confederates except Berne The touchiness of the now rapidly advancing League was shown by the eagerness with which in 1468 its members took up arms against certain small feudal nobles who were carrying on a harassing guerrilla warfare with their allies Schaffhausen and Mulhouse They laid siege to Waldshut, and to buy them off Sigismund in Aug 1468 engaged to pay 10,000 gulden as damages by June 24, 1469; in default of payment the Confederates were to keep for ever the Black Forest, and Waldshut on the Rhine. A short time before (1467) the League had made treaties of friendship with Philip the Good, duke of Burgundy, and with the duke of Milan.

The Burgundian War.—Sigismund did not know where to obtain the sum he had promised to pay. In this strait he turned to Charles the Bold, duke of Burgundy. On May 9, 1469, Charles promised to give Sigismund 50,000 florins, receiving as security for repayment Upper Alsace, the Breisgau, the Sundgau, the Black Forest, and the four Black Forest towns on the Rhine (Rheinfelden, Säckingen, Laufenburg and Waldshut), and agreed to give Sigismund aid against the Swiss, if he was attacked by them. It was not unnatural for Sigismund to think of attacking the League, but Charles's engagement to him is quite inconsistent with the friendly agreement made between Burgundy and the League as late as 1467. The emperor then on his side annulled Sigismund's treaty of 1468 with the Swiss, and placed them under the ban of the empire.

The Swiss in these circumstances began to look towards Louis XI. of France, who had confirmed the treaty of friendship made with them by his father in 1452 Sigismund had applied to him early in 1469 to help him in his many troubles, and to give him aid against the Swiss, but Louis had point-blank refused. Anxious to secure their neutrality in case of war between him and Charles, he made a treaty with them on Aug. 13, 1470 to this effect.

Sigismund in the next few years tried hard to get from Charles the promised aid against the Swiss (the money was paid punctually enough by Charles on his behalf). Charles on his side, in 1471–72, tried to make an alliance with the Swiss. Probably Charles wished to use both Sigismund and the Swiss to further his own interests, but his shifty policy had the effect of alienating both from him. Sigismund, disgusted with Charles, now inclined towards Louis, whose ally he formally became in the summer of 1473. The Confederates on their side were greatly moved by the oppression of their friends and allies in Alsace by Hagenbach, and tried in vain (Jan. 1474) to obtain some redress from his master. Charles's too astute policy had thus lost him both Sigismund and the Swiss. They now looked upon Louis, who, thoroughly aware of Charles's ambition, aimed at the reconciliation of Sigismund and the Swiss. On March 30, 1474 the Everlasting Compact was signed at Constance, by which Sigismund finally renounced all Austrian claims on the lands of the Confederates, they, on the other hand, agreed to support him if Charles did not give up the mortgaged lands when the money was paid down. The next day the Swiss and Sigismund joined the league of the Alsatian and Rhine cities. Charles was called on to receive the money contributed by the Alsatian cities, and to restore his lands to Sigismund He, however, took no steps. Within a week the oppressive bailiff Hagenbach was captured, and a month later (May 9, 1474) he was put to death On Oct. 9, the emperor, acting of course at the instance of Sigismund, ordered the Swiss to declare war against Charles, which took place on Oct. 25. Next day Louis formally ratified his alliance with the Confederates, promising money and pensions, the latter to be increased if he did not send men. Throughout these negotiations and later Berne directs Swiss policy, though all the Confederates are not quite agreed She was specially exposed to attack from Charles and Charles's ally (since 1468) Savoy, and her best chance of extending her territory lay towards the west and south The Forest districts, however, were very suspicious of this movement to the west, by which Berne alone could profit, though the League as a whole might lose; then, too, Uri had in 1440 finally won the Val Leventina, and she and her neighbours favoured a southerly policy—a policy which was crowned with success after the gallant victory won at Giornico in 1478 by a handful of men from Zurich, Lucerne, Uri and Schwyz over 12,000 Milanese troops.

The war in the west was begun by Berne and her allies by marauding expeditions across the Jura, in which Héricourt (Nov 1474) and Blamont (Aug. 1475) were taken Meanwhile Yolande, the duchess of Savoy, had, through fear of her brother Louis XI and hatred of Berne finally joined Charles and Milan (Jan 1475), the immediate result of which was the capture, by the Bernese and friends, of several places in Vaud, notably Grandson and Echallens, both held of Savoy by a member of the house of Chalon, princes of Orange (April 1475), as well as of Orbe and Jougne, held by the same, but under the count of Burgundy In the summer Berne seized on the Savoyard district of Aigle. Soon after (Oct.–Nov. 1475) the same energetic policy won for her the Savoyard towns of Morat, Avenches, Estavayer and Yverdon; while (Sept) the Upper Valais, which had conquered all Lower or Savoyard Valais, entered into alliance with Berne for the purpose of opposing Savoy by preventing the arrival of Milanese troops. Alarmed at their success, the emperor and Louis deserted (June–Sept.) the Confederates, who thus, by the influence of Louis and Bernese ambition, saw themselves led on and then abandoned to the wrath of Charles, and very likely to lose their new conquests They had entered on the war as "helpers" of the emperor, and now became principals in the war against Charles, who hastened across the Jura (Feb. 1476) to the aid of his ally Yolande On Feb. 21 Charles laid siege to the castle of Grandson, and after a week's siege the garrison of Bernese and Fribourgers was forced to surrender, while, by way of retaliation for the massacre of the garrison of Estavayer in 1475, of the 412 men two only were spared in order to act as executioners of their comrades. This hideous news met a large body of the Confeder-

ates gathered together in great haste to relieve the garrison, and going to their rendezvous at Neuchâtel, where both the count and town had become allies of Berne in 1406. An advance body of Bernese, Fribourgers and Schwyzers, in order to avoid the castle of Vauxmarcus (seized by Charles), on the shore of the Lake of Neuchâtel, and on the direct road from Neuchâtel to Grandson, climbed over a wooded spur to the north, and attacked (March 2) the Burgundian outposts. Charles drew back his force in order to bring down the Swiss to the more level ground where his cavalry could act, but his rear misinterpreted the order, and when the main Swiss force appeared over the spur the Burgundian army was seized with a panic and fled in disorder. The Swiss had gained a glorious victory, and regained their conquest of Grandson, besides capturing very rich spoil in Charles's camp, parts of which are preserved to the present day in various Swiss armouries. Such was the famous battle of Grandson. Charles at once retired to Lausanne, and set about reorganizing his army. He resolved to advance on Berne by way of Morat (or Murten), and laid siege to it on June 9. The Confederates had now put away all jealousy of Berne, and collected a large army. The decisive battle took place on the afternoon of June 22. After facing each other many hours in the driving rain, a body of Swiss, by outflanking Charles's van, stormed his palisaded camp, and the Burgundians were soon hopelessly beaten, the losses on both sides (a contrast to Grandson) being exceedingly heavy. Vaud was reoccupied by the Swiss (Savoy having overrun it on Charles's advance); but Louis now stepped in and procured the restoration of that region to Savoy, save Grandson, Morat, Orbe and Echallens, which were to be held by the Bernese jointly with the Fribourgers, Aigle by Berne alone—Savoy at the same time renouncing all its claims over Fribourg. Thus French-speaking districts first became permanently connected with the Confederation, hitherto purely German, and the war had been one for the maintenance of recent conquests, rather than purely in defence of Swiss freedom. Charles tried in vain to raise a third army; René recovered Lorraine, and on Jan. 5, 1477, under the walls of Nancy, Charles's wide-reaching plans were ended by his defeat and death, many Swiss being with René's troops. The wish of the Bernese to overrun Franche-Comté was opposed by the older members of the Confederation, and finally, in 1479, Louis, by very large payments, secured the abandonment of all claims on that province, which was annexed to France.

Internal Disputes in the League.—These glorious victories really laid the foundation of Swiss nationality; but soon after them the jealousy between the civic and rural elements which had always hindered common action nearly broke up the Confederation. The circumstances of its origin were long reflected in the constitution. Apart from certain military and police regulations, common action was limited to the meeting of two envoys from each member of the Confederation and one from each of the "socii" in the Diet, the powers of which included foreign relations, war and peace, and common arrangements as to police, pestilence, customs duties, coinage, etc. The decisions of the majority did not bind the minority save in the case of the affairs of the bailiwicks ruled in common. Thus everything depended on common agreement and good will. But disputes as to the divisions of the lands conquered in the Burgundian War, and the proposal to admit into the League the towns of Fribourg and Soleure, which had rendered such good help in the war, caused the two parties to form separate unions, for by the latter proposal the number of towns would have been made the same as that of the "Länder," which these did not at all approve. At the Diet of Stans (Dec. 1481), when it seemed probable that the failure of all attempts to come to an understanding would result in the disruption of the League, the mediation of Nicholas von der Flüe (or Bruder Klaus), a holy hermit of Sachseln in Obwalden, succeeded in bringing both sides to reason, and the "compact of Stans" was agreed on. By this the promise of mutual aid and assistance was renewed, especially when one member attacked another, and stress was laid on the duty of the several Governments to maintain the peace, and not to help the subjects of any other member in case of a rising. The treasure and movables captured in the war were to be equally divided amongst the combatants, but the territories and towns amongst the members of the League. As a practical proof of the reconciliation, on the same day the towns of Fribourg and Soleure were received as full members of the Confederation.

Practical Freedom from the Empire.—The early history of each member of the Confederation, and of the Confederation itself, shows that they always professed to belong to the empire, trying to become immediately dependent on the emperor in order to prevent oppression by middle lords, and to enjoy practical liberty. The empire itself had now become very much of a shadow; cities and princes were gradually asserting their own independence, sometimes breaking away from it altogether. Now, by the time of the Burgundian War, the Confederation stood in a position analogous to that of a powerful free imperial city. As long as the emperor's nominal rights were not enforced, all went well; but, when Maximilian, in his attempt to reorganize the empire, erected in 1495 at Worms an imperial chamber which had jurisdiction in all disputes between members of the empire, the Confederates were very unwilling to obey it—partly because they could maintain peace at home by their own authority, and partly because it interfered with their practical independence. Again, their refusal to join the "Swabian League," formed in 1488 by the lords and cities of South Germany to keep the public peace, gave further offence, as well as their fresh alliances with France. Hence a struggle was inevitable, and the occasion by reason of which it broke out was the seizure by the Tirolese authorities in 1499 of the Münsterthal, which belonged to the "Gotteshausbund," one of three leagues which had gradually arisen in Raetia. These were the "Gotteshausbund" in 1367 (taking in all the dependents of the cathedral church at Chur living in the Oberhalbstein and Engadine); the "Ober" or "Grauer Bund" in 1395 and 1424 (taking in the abbey of Disentis and many counts and lords in the Vorder Rhein valley); and the "League of the Ten Jurisdictions" (Zehngerichtenbund), which arose in the Prättigau and Davos valley (1436) on the death of Count Frederick of Toggenburg, but which, owing to certain Austrian claims in it, was not quite so free as its neighbours. In 1497 the Ober Bund, in 1498 the Gotteshausbund, made a treaty of alliance with the Swiss Confederation, the Ten Jurisdictions being unable to do more than show sympathy, owing to Austrian claims, which were not bought up till 1649 and 1652. Hence this attack on the Münsterthal was an attack on an "associate" member of the Swiss Confederation, Maximilian being supported by the Swabian League; but its real historical importance is the influence it had on the relations of the Swiss to the empire. The struggle lasted several months, but both sides being exhausted, peace was made at Basle on Sept. 22, 1499. By this the matters in dispute were referred to arbitration, and the emperor annulled all the decisions of the imperial chamber against the Confederation; but nothing was laid down as to its future relations with the empire.

The League Enlarged to Thirteen Members.—With the object of strengthening the northern border of the Confederation, two more full members were admitted in 1501—Basle and Schaffhausen—on the same terms as Fribourg and Soleure. The city of Basle had originally been ruled by its bishop, but early in the 14th century it became a free imperial city; before 1501 it had made no permanent alliance with the Confederation, though it had been in continual relations with it. Schaffhausen had grown up round the Benedictine monastery of All Saints, and became in the early 13th century a free imperial city, but was mortgaged to Austria from 1330 to 1415. It bought its freedom in 1418 and became an "associate" of the Confederation in 1454. A few years later, in 1513, Appenzell, which in 1411 had become a "protected" district, and in 1452 an "associate" member of the Confederation, was admitted as the thirteenth full member.

Conquests in Italy.—In the first years of the 16th century the influence of the Confederates south of the Alps was largely extended. The system of giving pensions, in order to secure the right of enlisting men within the Confederation, and of capitulations, by which the different members supplied troops, was originated by Louis XI. in 1474, and later followed by many other princes. Though a tribute to Swiss valour, this practice had very evil results, of which the first-fruits were seen in the Milanese

troubles (1500–16), of which the following is a summary. Both Charles VIII. (1484) and Louis XII. (1499 for ten years) renewed Louis XI.'s treaty. The French attempts to gain Milan were largely carried on by the help of Swiss mercenaries, some of whom were on the opposite side; and, as brotherly feeling was still too strong to make it possible for them to fight against one another, Lodovico Sforza's Swiss troops shamefully betrayed him to the French at Novara (1500). In 1500, too, the three Forest districts occupied Bellinzona (with the Val Blenio) at the request of its inhabitants, and in 1503 Louis XII. was forced to cede it to them. He, however, often held back the pay of his Swiss troops, and treated them as mere hirelings, so that when the ten years' treaty came to an end Matthew Schinner, bishop of Sitten (or Sion), induced them to join (1510) the pope, Julius II., then engaged in forming the Holy League to expel the French from Italy But when, after the battle of Ravenna, Louis XII became all-powerful in Lombardy, 20,000 Swiss poured down into the Milanese and occupied it, Felix Schmid, the burgomaster of Zurich, naming Maximilian (Lodovico's son) duke of Milan, in return for which he ceded to the Confederates Locarno, Val Maggia, Mendrisio and Lugano (1512), while the Raetian Leagues seized Chiavenna, Bormio and the Valtellina In 1513 the Swiss completely defeated the French at Novara Francis I on his accession (1515) began to prepare to win back the Milanese, and, successfully evading the Swiss awaiting his descent from the Alps, beat them in a pitched battle at Marignano near Milan (Sept 13, 1515), which broke the Swiss power in north Italy, so that in 1516 a peace was made with France—the Valais, the Three Raetian Leagues and both the abbot and town of St Gall being included on the side of the Confederates. Provision was made for the neutrality of either party in case the other became involved in war, and large pensions were promised. This treaty was extended by another in 1521 (to which Zurich, then under Zwingli's influence, would not agree, holding aloof from the French alliance till 1614), by which the French king might, with the consent of the Confederation, enlist any number of men between 6,000 and 16,000, paying them fit wages, and the pensions were raised to 3,000 francs annually to each member of the Confederation. These two treaties were the starting-point of later French interference with Swiss affairs. (W. A. B C; X)

REFORMATION AND COUNTER-REFORMATION

Zwingli.—When Zwingli came to Zurich as a preacher to the Grossmunster (1519), Protestantism found its way into Swiss history. The Evangelical movement in Switzerland was very different from Luther's Reformation in Germany. Zwingli was no direct disciple of Luther, he belonged to the group of the humanists. He had served as a chaplain with the troops in the Milanese, in 1512 and 1515, and began his career as a political rather than as a purely religious reformer His influence grew first over the people of Zürich (where he reformed the church and looked after the farmers in the country), and then over those towns of the League which accepted the new creed. As the movement passed over into German territory, Zwingli seriously began to build up a Protestant League which was to include the new Lutheran territories of the empire together with the political enemies of the House of Habsburg

Zwingli's interference with the political affairs of Switzerland had a lasting result. The League was definitely split into two parts. The Romanist camp included the Forest cantons with Lucerne, Zug, Soleure, Fribourg, the Evangelical camp was composed of the great city-cantons. Zürich, Berne, Basle with Glarus, Schaffhausen, Appenzell Naturally, this rupture meant a great loss of power to the League Switzerland was reduced to a merely passive position in the politics of Europe. There is, however, no reason to believe that religion was the sole cause of the split between Evangelicals and Romanists. The deep-rooted antagonism between the purely rural districts represented by the Forest cantons in the pre-Alps and the city-cantons of the Swiss plain underlay Swiss politics from the very beginning and has an economic explanation. Just as the pre-Reformation period had witnessed the Old Zürich War, the Reformation witnessed the war of Kappel, where Zürich stood again in the field against the Forest districts and their allies. And again Zürich was beaten, and her great leader Zwingli slain (1531). The Reformation movement was stopped at once; it lost all its offensive spirit; much of the ground it had gained before passed into the hands of the Catholics. The second peace of Kappel (1531), though formally recognizing the existing conditions of the expansion of the new creed, made special provisions to facilitate in the "common bailiwicks" the return of the people to the old creed. Protected by the victorious party, Catholicism recaptured many a lost position.

The Conquest of Vaud.—Berne had an eminently political interest in upholding the Evangelical creed regarding her policy towards Savoy. Since the wars of Burgundy, Berne had got a footing in the French-speaking districts round the lakes of Neuchâtel and Morat and south of them, and she wished to develop her position further south round the lake of Geneva. The city of Geneva was the natural centre of the northern Savoyard district and the key to Vaud as well. The conflict of her burghers with the duke of Savoy, into whose hands the see of Geneva had passed, and the strong effort of the burghers to free themselves from any feudal power, made the alliance of Geneva with the neighbouring Swiss cities a political necessity (alliance with Fribourg 1519, with Berne 1526). 1536, the date which marks the definite victory of Protestantism in Geneva, is also the year of the expulsion of the Savoyard forces from Vaud, and the establishment by Berne of her rule over the district of the Leman, where the new creed was introduced and serfdom was abolished in the country districts This success compensated for the losses sustained by the Evangelical cause in German Switzerland It was in two ways a gain to the country; it enabled Calvin to develop his theocracy in Geneva and to make Geneva the centre of Swiss Protestantism, on the basis of a union between the Geneva and Zurich reformers. A further consolidation of the territorial position of Geneva to the west and south of the lake was made impossible by the interference of the Catholic members of the League, who contracted different alliances with the duke of Savoy Finally Geneva turned to France

The Counter-Reformation.—The Catholic members of the League developed a policy of their own The first impulse had in fact come from the other side, Zwingli taking the lead in contracting an alliance founded on religious principles (*Christliches Burgrecht* between Zurich, Constance and Berne, etc 1527–28). Yet the Romanists departed even more from former principles by directing their own efforts against the very tradition of national policy. This was all the more important as—since the second Peace of Kappel—the Catholics had secured the stronger position in the country The Counter-Reformation had inspired them just as the Reformation had inspired the Protestants They felt the influence of a great leader, Carlo Borromeo, the archbishop of Milan, whose diocese included the Italian bailiwicks, and who founded the "Collegium Helveticum" at Milan for the training of the Swiss clergy. The arrival of the Jesuits at Lucerne and Fribourg as well as the delegation of a permanent nuncio to the cantons marks the beginning of the regeneration of Roman Catholicism. The Capuchins—a Minorite order—extended their activity more to the country districts Results were soon apparent: not only were border districts such as the Valais and the Chablais, and on the opposite side Constance, lost for Protestantism, but among the League itself, in Appenzell and in Glarus, the Catholic movement became so strong, that in the case of Appenzell, it ended with a rupture, the canton being henceforward divided into two half cantons. Lucerne became the centre, almost the capital, of Catholic Switzerland The papal nuncio had his residence at Lucerne. The diet of the Catholic members met there (the Evangelicals sat at Aarau), supported by the invaluable activities of Ludwig Pfyffer, the great religious reactionary, formerly chief of the Swiss soldiers in the service of France, and commonly known in his time as the "Swiss king." A visible symbol of the new spirit amongst the Catholics was the Golden or Borromean League, founded in 1586. This League brought the old League near to disintegration as it formally stated that its members must prefer the new League to all former contracts, and it showed in fact by its alliances with the House of Habsburg (with the emperor 1529, with Spain 1557,

1587, etc.), that its members were strongly confirmed in their resolution to forget the past.

FROM THE THIRTY YEARS' WAR TO THE WARS OF NAPOLEON

Thirty Years' War.—With the beginning of the 17th century the waves of religious passion in the League were calming down, though nothing in the attitude of the parties was changed. The religious conflicts, originally internal disputes, became mixed up with the great political international problems of Europe. But the division of the parties did not coincide with the religious divisions. In the Thirty Years' War France took the side of the Protestants against the Habsburgs, and Swiss mercenaries from the Catholic Cantons fought on the side of Catholic France in helping the Protestant Powers to destroy the Habsburgs. Switzerland was lucky to escape the terrible lot of the German lands. The Raetian Leagues, however, were drawn into the war in consequence of the great strategical value of the Valtellina for the Habsburgs, as one of the main connections between Milan and the Tirol. For over 30 years the Grisons were the scene of the most atrocious party warfare; a Protestant party worked for the French, a Catholic party for the Spaniards, until George Jenatsch, originally a Protestant parson, with Spanish aid threw out the French, his own former allies,—thus liberating his country at last from foreign occupation.

The Treaty of Westphalia gave Switzerland that formal recognition of its independence from the empire, which it had possessed in fact since 1499. The position of the League was thus apparently strengthened, but the separation from the empire brought her more within the compass of France's influence. This less favourable result was partly compensated by the Defensionale of Wil (1647, finally adopted 1668) which marks the beginnings of the organization of a home army for the common defence of the Swiss territory, and shows for the first time since the Reformation a kind of national spirit within the League.

The Peasant War and First Villmergen War.—The 30 Years' War was followed by a social and economical revolution. The Peasant War (1653) grouped together the towns against the peasants; for the first time since the Reformation Evangelicals and Catholics acted together to defend their economic and administrative supremacy over the country people. The farmers had prospered during the period from 1618 to 1648. In this period was laid the foundation of Swiss wealth, the territories of the League having been spared the destruction suffered by their neighbours. But the after-war reaction was felt the more heavily by the farmers; the price of land, very high during the war, fell suddenly and a financial crisis followed. The towns persistently developed a dominating position over the land by the acquisition of former feudal rights, by simplifying the administration and by making it more efficient by levying higher taxes. Thus the country people felt a double dependence: an economic and a political one, and the Peasant War can be considered as a democratic reaction against the growing tendency towards oligarchy. It could not but end with defeat for the farmers and had consequently just the opposite effect to its purpose: it strengthened the towns instead of weakening them. This conflict between burghers and farmers was followed by a contest among the victors themselves. Remembering the experience of 1653 which had united Evangelical and Catholic members of the League, Zürich launched a scheme for a reform of the constitution of the League, based on the idea of more centralization and the predominance of the larger cantons. This idea, however, met with refusal from the Catholics, who realized that their predominant position within the League rested on the principle of the sovereignty of single members. They openly manifested their dislike of the new idea by reconfirming their own Golden League on the advice of the papal nuncio. Zürich decided to trust again to the luck of war, but again she was beaten (at Villmergen, Aargau, 1656). For another half century the League was to be under the sway of the Catholics.

Louis XIV.—Switzerland was so nearly connected with the kingdom of France that Louis XIV.'s reign had necessarily a lasting influence on Swiss affairs. First, the traditional friendship between the League and France was very solemnly renewed, when the delegates of the League confirmed a new treaty of alliance at Notre Dame by solemn oath (1663). Yet the king's policy of eastward expansion advanced the frontiers of France towards Swiss territory through the acquisition of Franche Comté. This territory, belonging to Spain, had acted like a buffer between Switzerland and France. The fall of Strasbourg—this old ally of the League—and the construction of a fortress near Basel on the Rhine were further signs of Louis's wish to encroach on the territory of the empire. All this might not totally have estranged Swiss sympathies from the king, had he not by the revocation of the Edict of Nantes (*q.v.*) provoked the anger of the Evangelicals. Zürich answered by concluding in 1693 a capitulation with Holland, though this had the unhappy result of Swiss troops fighting against each other (Malplaquet). The succession of the Bourbons to the Spanish throne, upsetting the equilibrium of European politics, was naturally felt by the League. France, hitherto the political friend of the Evangelicals, turned to the side of the Catholics, the former allies of Spain, while the Evangelicals began to back the empire. The French ambassador, so far the main agent in promoting the pacification of the League, henceforward openly favoured the Catholics against the Evangelicals. On his instigation the second Villmergen war broke out on the same issue as the first, but it ended this time in favour of the great cities. The balance of power was restored in favour of the Protestant party and the provisions of the second peace of Kappel were definitely abrogated (Peace of Aarau, 1712).

18th Century.—In the 18th century no spectacular events occurred before the beginning of the French Revolution. The economical and intellectual development, however, was quite remarkable. The wealth of the country was great; the population increased enormously, in many places doubling its number in the course of a century. Since 1444 there had been no real invasion. The mercenary service brought a great amount of money, 60–70,000 men and officers being constantly engaged in foreign armies. Swiss agriculture was very prosperous. Under the influence of the Physiocratic school big model farms were formed (*Hofwil*) and a more rational type of farming was introduced. Cattle for breeding and for food, horses for military purposes, wine and cheese (already manufactured on an industrial base) were the chief export articles. In the cotton trade 200,000 people—mostly in the eastern part of the country—were engaged; St. Gall had 30–40,000 embroiderers in its pay, who lived in the neighbouring districts. The centre of the silk trade was Zürich. Basle manufactured ribbons and the Jura district had already a small metallurgical industry.

All would have been well, had there not been a tendency to social stagnation. The cantons were altogether under the spell of absolutism. There were as many absolute Governments as cantons existed in the League. The character of Switzerland was therefore typically particularist as well as anti-democratic. The League was one of the most complicated political bodies of the time. It represented a federation of 13 quasi-independent states, to which were attached almost the same number of allied states. Each of the cantons had its own subjects and in addition groups of cantons ruled alternately in the "common bailiwicks." The cantons themselves had different types of Government. We can distinguish a group of *democratic* cantons, represented by Uri, Schwyz, Unterwalden, Zug, Glarus, Appenzell. Officially governed by the *Landsgemeinde*, the government posts were actually in the hands of a few families, which lived on pensions from the foreign Powers. To another group belong the *gild* cantons, Zürich, Basle and Schaffhausen. Their Governments were formed by the gild-corporations of the towns. The admission to the gilds was very strictly limited; people newly established in the town had no chance of admission and were likewise excluded from the Government. Finally the *aristocratic* cantons, Berne, Lucerne, Fribourg and Soleure formed a group of their own.

Two other types of Government were represented by the allies of the League: the federal type by the Valais and the Raetian Leagues and the monarchic type by the principality of Neuchâtel (which had passed into the hands of the Prussian king to counteract French influence) and the territories of the prince-bishop of Basle, the abbots of St. Gall and of Engelberg. The public law of

the League consisted of those few charters commonly accepted in the 14th and 15th centuries and completed by the Defensionale of 1647, the renewal of which had not always been generally accepted. The absolutist tendency of the time, which in Bern excluded all but 67 families from the Government, further divided the population into a ruling and a ruled class Besides the often badly treated subjects of the "common bailiwicks" the country subjects of the gild cantons were not much better off, and in the towns there was opposition from the non-admitted citizens and from those burghers who—though they were long established—had been deprived of some of the privileges of Government. It is, however, just to remark that in the aristocratic cantons (chiefly in Bern) the peasants were less exploited and agriculture was better developed than in the gild cantons. In Vaud for instance the discontented class were not the farmers, but the descendants of the old Savoyard aristocracy. Different attempts at a reform were made; some had their origin within the ruling class itself (Henzi's action at Berne, 1749) others came from the subjects (the Stafener articles, 1794–5), but they were suppressed. In the second half of the century there was a general movement among the educated classes of the whole country to promote a political programme on a national basis and a society was formed to this end (*Helvetische Gesellschaft,* 1760).

Revolutionary and Napoleonic Period.—The League could not but be affected by the French Revolution, but without the French armies Switzerland would never have been revolutionized as it was in the years from 1798 to 1802. The revolution was actually imported into the League's territories. The invasion of French troops was suggested to the Revolutionary Government by members of the Helvetian club in Paris, but mainly by Frédéric César La Harpe (formerly tutor to the later Tsar Alexander I) and Peter Ochs, the burgomaster of Basle, who believed that the French influence would have a salutary effect on the reform movement in Switzerland In reality it brought the country the burden of a foreign occupation, which was nowhere enjoyed; in certain places, as in the Forest districts, it provoked a heroic, but naturally vain resistance. Apart from the strategic value of Switzerland the French could reckon with a splendid booty of which the State treasuries—symbols of accumulated wealth—were only a part For years the country had to feed the French troops which Bonaparte kept ready for future campaigns Switzerland got its first constitution, drawn on the principles of the French constitution of the Directory in April 1798 If the "Helvetic Republic" had worked, it would have transformed the League into a centralized State after the example of France.

With the French occupation, Switzerland became a part of the European theatre of war, and shared the fate of other certain European countries The Valtellina and the Valais were cut off from the League (1797, 1802) as Napoleon needed the Valais for his communications with the Cisalpine Republic and the Valtellina as direct passage from Lombardy to Tirol He also took Ticino in 1810, but soon offered to return it.

Napoleon's attitude towards Switzerland changed after 1801. Until 1801 Switzerland remained an occupied territory and was several times involved in the great struggle for or against France The two battles of Zurich (June and Sept 1799), one a defeat, the other a victory, for the French, were important incidents in the fight for the possession of the Swiss territory between France and the allies, Austria and Russia France was victorious in the end. When Germany was reconstructed according to the terms of the Treaty of Lunéville, the occupation of the Swiss territory was no more a necessity It was on the contrary an advantage for Napoleon to help the Swiss to settle down, and so to be sure of this strategically important territory Thus Napoleon became the author of the first Swiss constitution of practical value—the Act of Mediation (1802–3), which he worked out with the help of delegates from the different Swiss parties. This constitution recognized the sovereignty of the cantons (joining to the old cantons the "common bailiwicks" and some allied districts) and revived the old diet. The president (*Landammann*) of the diet was formally to represent the central Government, but he was invested with no executive power. Napoleon realized that by giving back to Switzerland its federal Governments he diverted the country from taking an active part in the war against France. In a treaty of alliance he secured for himself the monopoly for the recruitments of Swiss troops, thus breaking the practice of many centuries, on which was built the principle of neutrality (1807, Swiss recalled from England) Independence was therefore a mere word The Mediation period showed conclusively that there could be no freedom for Switzerland as long as Europe was dominated by a single power Actual freedom was only restored when the Napoleonic power was definitely broken. (M Si.)

THE 19TH AND 20TH CENTURIES

On Oct. 18, 1813, the Allies defeated Napoleon at Leipzig This event, in which the Swiss were in no way involved, profoundly affected their history. Some weeks later the Allied armies reached the frontiers of the Swiss Confederation It was at first doubtful whether they would cross. Opinion among the Allies was divided; the Russians and the Prussians objected, but the views of Austria, supported by England, finally triumphed. On Dec. 21, 1813, the neutrality of Switzerland was violated.
